About This Book

This book provides experienced C programmers with complete detailed information about Base Operating System runtime services for the AIX operating system. Runtime services are listed alphabetically, and complete descriptions are given for them. This volume contains AIX services that begin with the letters Q through Z. To use the book effectively, you should be familiar with commands, system calls, subroutines, file formats, and special files. This publication is also available on the documentation CD that is shipped with the operating system.

This book is part of the six-volume technical reference set, *AIX 5L Version 5.3 Technical Reference*, that provides information on system calls, kernel extension calls, and subroutines in the following volumes:

- AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1 and AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 2 provide information on system calls, subroutines, functions, macros, and statements associated with base operating system runtime services.
- AIX 5L Version 5.3 Technical Reference: Communications Volume 1 and AIX 5L Version 5.3 Technical Reference: Communications Volume 2 provide information on entry points, functions, system calls, subroutines, and operations related to communications services.
- AIX 5L Version 5.3 Technical Reference: Kernel and Subsystems Volume 1 and AIX 5L Version 5.3
 Technical Reference: Kernel and Subsystems Volume 2 provide information about kernel services,
 device driver operations, file system operations, subroutines, the configuration subsystem, the
 communications subsystem, the low function terminal (LFT) subsystem, the logical volume subsystem,
 the M-audio capture and playback adapter subsystem, the printer subsystem, the SCSI subsystem, and
 the serial DASD subsystem.

Highlighting

The following highlighting conventions are used in this book:

Bold

Italics

Monospace

Identifies commands, subroutines, keywords, files, structures, directories, and other items whose names are predefined by the system. Also identifies graphical objects such as buttons, labels, and icons that the user selects. Identifies parameters whose actual names or values are to be supplied by the user.

Identifies examples of specific data values, examples of text similar to what you might see displayed, examples of portions of program code similar to what you might write as a programmer, messages from the system, or information you should actually type.

Case-Sensitivity in AIX

Everything in the AIX operating system is case-sensitive, which means that it distinguishes between uppercase and lowercase letters. For example, you can use the **Is** command to list files. If you type LS, the system responds that the command is "not found." Likewise, **FILEA**, **FiLea**, and **filea** are three distinct file names, even if they reside in the same directory. To avoid causing undesirable actions to be performed, always ensure that you use the correct case.

ISO 9000

ISO 9000 registered quality systems were used in the development and manufacturing of this product.

32-Bit and 64-Bit Support for the Single UNIX Specification

Beginning with Version 5.2, the operating system is designed to support The Open Group's Single UNIX Specification Version 3 (UNIX 03) for portability of UNIX-based operating systems. Many new interfaces, and some current ones, have been added or enhanced to meet this specification, making Version 5.2 even more open and portable for applications, while remaining compatible with previous releases of AIX. To determine the proper way to develop a UNIX 03-portable application, you may need to refer to The Open Group's UNIX 03 specification, which can be accessed online or downloaded from http://www.unix.org/.

Chapter 1. Base Operating System (BOS) Runtime Services (Q-Z)

qsort Subroutine

Purpose

Sorts a table of data in place.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
void qsort (Base, NumberOfElements, Size, ComparisonPointer)
void * Base;
size_t NumberOfElements, Size;
int (*ComparisonPointer)(const void*, const void*);
```

Description

The **qsort** subroutine sorts a table of data in place. It uses the quicker-sort algorithm.

Parameters

Base Points to the element at the base of the table.

NumberOfElements Specifies the number of elements in the table.

Size Specifies the size of each element.

ComparisonPointer Points to the comparison function, which is passed two parameters that point to

the objects being compared. The **qsort** subroutine sorts the array in ascending

order according to the comparison function.

Return Values

The comparison function compares its parameters and returns a value as follows:

- If the first parameter is less than the second parameter, the *ComparisonPointer* parameter returns a value less than 0.
- If the first parameter is equal to the second parameter, the ComparisonPointer parameter returns 0.
- If the first parameter is greater than the second parameter, the *ComparisonPointer* parameter returns a value greater than 0.

Because the comparison function need not compare every byte, the elements can contain arbitrary data in addition to the values being compared.

Note: If two items are the same when compared, their order in the output of this subroutine is unpredictable.

The pointer to the base of the table should be of type pointer-to-element, and cast to type pointer-to-character.

Searching and Sorting Example Program, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

quantized32, quantized64, or quantized128 Subroutine

Purpose

Sets the exponent of the first parameter to the exponent of the second parameter, attempting to keep the value the same.

Syntax

```
#include <math.h>
Decimal 32 quantized 32 (x, y)
_Decima132 x;
Decimal32 y;
Decimal64 quantized64 (x, y)
Decimal64 x;
Decimal64 y;
Decimal 128 quantized 128 (x, y)
Decimal 128 x;
Decimal 128 y;
```

Description

The quantized32, quantized64, and quantized128 subroutines set the exponent of the x parameter to the exponent of y parameter, while attempting to keep the value the same. If the exponent is increased, the value is correctly rounded according to the current rounding mode; if the result does not have the same value as that of the x parameter, the inexact floating-point exception is raised. If the exponent is decreased and the significand of the result has more digit than the type allows, the result is NaN and the invalid floating-point exception is raised.

If one or both operands are NaN, the result is NaN. If only one operand is infinite, the result is NaN and the invalid floating-point exception is raised. If both operands are infinite, the result is DEC INFINITY and the sign is the same as that of the x parameter.

An application checking for error situations should set the value of the errno global variable to zero and call the feclearexcept (FE_ALL_EXCEPT) subroutine before calling these subroutines. Upon return, if the value of the errno global variable is nonzero or the return value of the fetestexcept(FE_INVALID I FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) subroutine is nonzero, an error has occurred.

Parameters

```
Specifies the value to be computed.
Specifies the value to be computed.
```

Return Values

The quantized32, quantized64, and quantized128 subroutines return the number that is equal to the x parameter in value (except for any rounding) and sign and has an exponent equal to that of the y parameter.

quotactl Subroutine

Purpose

Manipulates disk quotas.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/fs/quota_common.h>
int quotactl (Path, Cmd, ID, Addr)
int Cmd, ID;
char * Addr, * Path;
```

Description

The **quotactl** subroutine enables, disables, and manipulates disk quotas for file systems on which quotas have been enabled.

On AIX, disk quotas are supported by the legacy Journaled File System (JFS) and the enhanced Journaled File System (JFS2).

The *Cmd* parameter is constructed through use of the **QCMD**(*Qcmd*, *type*) macro contained within the **sys/fs/quota_common.h** file. The *Qcmd* parameter specifies the quota control command. The *type* parameter specifies either user (**USRQUOTA**) or group (**GRPQUOTA**) quota type.

The valid values for the *Cmd* parameter in all supported file system types sare:

Q_QUOTAON

Enables disk quotas for the file system specified by the *Path* parameter. The *Addr* parameter specifies a file from which to take the quotas. The quota file must exist; it is normally created with the **quotacheck** command. The *ID* parameter is unused. Root user authority is required to enable quotas. By specifying the new quota file path in the *Addr* parameter, the **quotactl** command can also be used to change the quota file that is being used without first disabling disk quotas.

Q QUOTAOFF

Disables disk quotas for the file system specified by the *Path* parameter. The *Addr* and *ID* arguments are unused. Root user authority is required to disable quotas.

Additional JFS specific values for the *Cmd* parameter are as follows:

Q GETQUOTA

Gets disk quota limits and current usage for a user or group specified by the *ID* parameter. The *Addr* parameter points to a **dqblk** buffer to hold the returned information. The **dqblk** structure is defined in the **jfs/quota.h** file. Root user authority is required if the *ID* value is not the current ID of the caller.

Q_SETQUOTA

Sets disk quota limits for the user or group specified by the *ID* parameter. The *Addr* parameter points to a **dqblk** buffer containing the new quota limits. The **dqblk** structure is defined in the **jfs/quota.h** file. Root user authority is required to set quotas.

Q SETUSE

Sets disk usage limits for the user or group specified by the *ID* parameter. The *Addr* parameter points to a **dqblk** buffer containing the new usage limits. The **dqblk** structure is defined in the **jfs/quota.h** file. Root user authority is required to set disk usage limits.

Additional JFS2 specific values for the *Cmd* parameter are as follows:

Q J2GETQUOTA

Gets quota limits, current usage, and time remaining in grace periods for the user or group specified by the *ID* parameter. The *Addr* parameter points to a **quota64_t** buffer to hold the returned information. The **quota64_t** structure is defined in the **quota_common.h** file. Root user authority is required if the *ID* value is not the current ID of the caller.

Q J2PUTQUOTA

Updates (replaces) the current usage values for the user or group specified by the *ID* parameter. The *Addr* parameter points to a **quota64_t** buffer holding the new information. The **quota64_t** structure is defined in the **quota common.h** file. Root user authority is required.

Q_J2GETLIMIT

Gets quota limits information for the Limits Class specified by the *ID* parameter. The *Addr* parameter points to a **j2qlimit_t** buffer to hold the returned information. The **j2qlimit_t** structure is defined in the **j2/j2_quota.h** file. Root user authority is required.

Q J2PUTLIMIT

Updates quota limits information for the Limits Class specified by the *ID* parameter. The *Addr* parameter points to a **j2qlimit_t** buffer holding the new information. The **j2qlimit_t** structure is defined in the **j2/j2_quota.h** file. Root user authority is required.

Q J2NEWLIMIT

Creates a new Limits Class and updates it with the quota limits information from *Addr*. The *ID* parameter is ignored. The *Addr* parameter points to a **j2qlimit_t** buffer holding the new information. The **j2qlimit_t** structure is updated with the new Limits Class ID and returned to the user. The **j2qlimit_t** structure is defined in the **j2/j2_quota.h** file. Root user authority is required.

Q J2RMVLIMIT

Marks the Limits Class specified by the *ID* parameter as deleted. Any Usage record referencing a deleted Limits Class is now limited by the default Limits Class. The *Addr* parameter is ignored. Root user authority is required.

Q J2DEFLIMIT

Sets the Limits Class specified by the *ID* parameter as the default Limits Class. The *Addr* parameter is ignored. Root user authority is required.

Q J2USELIMIT

Binds a Usage record to the Limits Class specified by the *ID* parameter. The Limits Class must be valid; otherwise, **ENOENT** is returned. Use the *Addr* parameter to pass a pointer to the user ID or group ID. Root user authority is required.

Q J2GETNEXTQ

Returns the ID of the next allocated, nondeleted Limits Class higher than the ID specified by the ID parameter. The Addr parameter points to a buffer containing a **uid_t** structure. Root user authority is required.

Q_J2INITFILE

Initializes an existing quota file. The *Addr* and *ID* parameters are ignored. Root user authority is required.

Q J2QUOTACHK

Performs a consistency check on an existing quota file. If any of the control data within the file is invalid or inconsistent, **Q_J2QUOTACHK** attempts to reconstruct the control data based on existing quota data in the file. If no **qwuota** data can be recognized, the file is initialized. The *Addr* and *ID* parameters are ignored. Root user authority is required.

Parameters

Path Specifies the path name of any file within the mounted file system to which the quota control command is to be applied. Typically, this would be the mount point of the file system.

Cmd Specifies the quota control command to be applied and whether it is applied to a user or group quota.

Specifies the user or group ID to which the quota control command applies. The ID parameter is interpreted by the specified quota type. The JFS file system supports quotas for IDs within the range of **MINDQUID** through **MAXDQID**; JFS2 supports all IDs.

Addr Points to the address of an optional, command-specific, data structure that is copied in or out of the system. The interpretation of the *Addr* parameter for each quota control command is given above.

Return Values

A successful call returns 0; otherwise, the value -1 is returned and the **errno** global variable indicates the reason for the failure.

Error Codes

A quotactI subroutine will fail when one of the following occurs:

EACCES In the Q_QUOTAON command, the quota file is not a regular file.

EACCES Search permission is denied for a component of a path prefix.

EFAULT An invalid *Addr* parameter is supplied; the associated structure could not be

copied in or out of the kernel.

EFAULT The *Path* parameter points outside the process's allocated address space.

EINVAL The specified quota control command or quota type is invalid. **EINVAL** Path name contains a character with the high-order bit set.

EINVAL The ID parameter is outside of the supported range of MINDQID through

MAXDQID (JFS only).

EIO An I/O error occurred while reading or writing the quotas file.

ELOOPToo many symbolic links were encountered in translating a path name. **ENAMETOOLONG**A component of either path name exceeded 255 characters, or the entire

length of either path name exceeded 1023 characters.

ENOENT A file name does not exist.

ENOTBLKMounted file system is not a block device. **ENOTDIR**A component of a path prefix is not a directory. **EOPNOTSUPP**The file system does not support quotas.

EPERM The quota control commands is privileged and the caller did not have root

user authority.

EROFS In the Q_QUOTAON command, the quota file resides on a read-only file

system.

EUSERS The in-core quota table cannot be expanded (JFS only).

Related Information

The quotacheck command.

Disk Quota System Overview in Security.

raise Subroutine

Purpose

Sends a signal to the currently running program.

Libraries

Standard C Library (libc.a)

Threads Library (libpthreads.a)

Syntax

```
#include <sys/signal.h>
int raise ( Signal)
int Signal;
```

Description

The **raise** subroutine sends the signal specified by the *Signal* parameter to the executing process or thread, depending if the POSIX threads API (the **libpthreads.a** library) is used or not. When the program is not linked with the threads library, the **raise** subroutine sends the signal to the calling process as follows:

```
return kill(getpid(), Signal);
```

When the program is linked with the threads library, the **raise** subroutine sends the signal to the calling thread as follows:

```
return pthread kill(pthread self(), Signal);
```

When using the threads library, it is important to ensure that the threads library is linked before the standard C library.

Parameter

Signal Specifies a signal number.

Return Values

Upon successful completion of the **raise** subroutine, a value of 0 is returned. Otherwise, a nonzero value is returned, and the **errno** global variable is set to indicate the error.

Error Code

EINVAL The value of the sig argument is an invalid signal number

Related Information

The **_exit** subroutine, **kill** subroutine, **pthread_kill** subroutine, **sigaction** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine.

Signal Management in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs provides more information about signal management in multi-threaded processes.

rand or srand Subroutine

Purpose

Generates pseudo-random numbers.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
int rand
void srand ( Seed)
unsigned int Seed;
```

Description

Attention: Do not use the rand subroutine in a multithreaded environment. See the multithread alternative in the **rand r** ("rand r Subroutine" on page 8) subroutine article.

The rand subroutine generates a pseudo-random number using a multiplicative congruential algorithm. The random-number generator has a period of 2**32, and it returns successive pseudo-random numbers in the range from 0 through (2**15) -1.

The **srand** subroutine resets the random-number generator to a new starting point. It uses the *Seed* parameter as a seed for a new sequence of pseudo-random numbers to be returned by subsequent calls to the rand subroutine. If you then call the srand subroutine with the same seed value, the rand subroutine repeats the sequence of pseudo-random numbers. When you call the rand subroutine before making any calls to the srand subroutine, it generates the same sequence of numbers that it would if you first called the **srand** subroutine with a seed value of 1.

Note: The rand subroutine is a simple random-number generator. Its spectral properties, a mathematical measurement of randomness, are somewhat limited. See the drand48 subroutine or the random subroutine for more elaborate random-number generators that have greater spectral properties.

Parameter

Seed Specifies an initial seed value.

Return Values

Upon successful completion, the rand subroutine returns the next random number in sequence. The srand subroutine returns no value.

There are better random number generators, as noted above; however, the rand and srand subroutines are the interfaces defined for the ANSI C library.

Example

The following functions define the semantics of the rand and srand subroutines, and are included here to facilitate porting applications from different implementations:

```
static unsigned int next = 1;
int rand( )
{
next = next
1103515245 + 12345;
return ((next >>16) & 32767);
void srand (Seed)
```

```
unsigned
int Seed;
{
next = Seed;
```

Related Information

The drand48, erand48, Irand48, nrand48, mrand48, jrand48, srand48, seed48, or lcong48 subroutine, random, srandom, initstate, or setstate ("random, srandom, initstate, or setstate Subroutine" on page 9) subroutine.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

rand_r Subroutine

Purpose

Generates pseudo-random numbers.

Libraries

Thread-Safe C Library (libc_r.a)

Berkeley Compatibility Library (libbsd.a)

Syntax

```
#include <stdlib.h>
int rand_r (Seed)
unsigned int * Seed;
```

Description

The **rand_r** subroutine generates and returns a pseudo-random number using a multiplicative congruential algorithm. The random-number generator has a period of 2**32, and it returns successive pseudo-random numbers.

Note: The **rand_r** subroutine is a simple random-number generator. Its spectral properties (the mathematical measurement of the randomness of a number sequence) are limited. See the **drand48** subroutine or the **random** ("random, srandom, initstate, or setstate Subroutine" on page 9) subroutine for more elaborate random-number generators that have greater spectral properties.

Programs using this subroutine must link to the libpthreads.a library.

Parameter

Seed Specifies an initial seed value.

Return Values

- Indicates that the subroutines was successful.
- -1 Indicates that the subroutines was not successful.

Error Codes

If the following condition occurs, the **rand_r** subroutine sets the **errno** global variable to the corresponding value.

EINVAL The *Seed* parameter specifies a null value.

File

/usr/include/sys/types.h

Defines system macros, data types, and subroutines.

Related Information

The drand48 subroutine, random ("random, srandom, initstate, or setstate Subroutine") subroutine.

Subroutines Overview and List of Multithread Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

random, srandom, initstate, or setstate Subroutine

Purpose

Generates pseudo-random numbers more efficiently.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
long random ()
void srandom (Seed)
unsigned int Seed;
char *initstate (Seed, State, Number)
unsigned int Seed;
char *State;
size_t Number;
char *setstate (State)
const char *State;
```

Description

Attention: Do not use the **random**, **srandom**, **initstate**, or **setstate** subroutine in a multithreaded environment.

The **random** subroutine uses a non-linear additive feedback random-number generator employing a default-state array size of 31 long integers to return successive pseudo-random numbers in the range from 0 to 2**31-1. The period of this random number generator is very large, approximately 16 * (2**31-1). The size of the state array determines the period of the random number generator. Increasing the state array size increases the period.

With a full 256 bytes of state information, the period of the random-number generator is greater than 2**69, which should be sufficient for most purposes.

The **random** and **srandom** subroutines have almost the same calling sequence and initialization properties as the rand and srand subroutines. The difference is that the rand subroutine produces a much less random sequence; in fact, the low dozen bits generated by the rand subroutine go through a cyclic pattern. All the bits generated by the random subroutine are usable. For example, random()&01 produces a random binary value.

The srandom subroutine, unlike the srand subroutine, does not return the old seed because the amount of state information used is more than a single word. The initstate subroutine and setstate subroutine handle restarting and changing random-number generators. Like the rand subroutine, however, the random subroutine by default produces a sequence of numbers that can be duplicated by calling the srandom subroutine with 1 as the seed.

The **initstate** subroutine allows a state array, passed in as an argument, to be initialized for future use. The size of the state array (in bytes) is used by the initstate subroutine, to decide how sophisticated a random-number generator it should use; the larger the state array, the more random are the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. For amounts greater than or equal to 8 bytes, or less than 32 bytes, the **random** subroutine uses a simple linear congruential random number generator, while other amounts are rounded down to the nearest known value. The Seed parameter specifies a starting point for the random-number sequence and provides for restarting at the same point. The initstate subroutine returns a pointer to the previous state information array.

Once a state has been initialized, the **setstate** subroutine allows rapid switching between states. The array defined by State parameter is used for further random-number generation until the initstate subroutine is called or the **setstate** subroutine is called again. The **setstate** subroutine returns a pointer to the previous state array.

After initialization, a state array can be restarted at a different point in one of two ways:

- The **initstate** subroutine can be used, with the desired seed, state array, and size of the array.
- The **setstate** subroutine, with the desired state, can be used, followed by the **srandom** subroutine with the desired seed. The advantage of using both of these subroutines is that the size of the state array does not have to be saved once it is initialized.

Parameters

Seed Specifies an initial seed value.

State Points to the array of state information.

Number Specifies the size of the state information array.

Error Codes

If the initstate subroutine is called with less than 8 bytes of state information, or if the setstate subroutine detects that the state information has been damaged, error messages are sent to standard error.

Related Information

The drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, or srand48 subroutine, rand or srand ("rand or srand Subroutine" on page 6) subroutine.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ra_attachrset Subroutine

Purpose

Attaches a work component to a resource set.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int ra_attachrset (rstype, rsid, rset, flags)
rstype_t rstype;
rsid_t rsid;
rsethandle_t rset;
unsigned int flags;
```

Description

The **ra_attachrset** subroutine attaches a work component specified by the *rstype* and *rsid* parameters to a resource set specified by the *rset* parameter.

The work component is an existing process identified by the process ID or an existing kernel thread identified by the kernel thread ID (tid). A process ID or thread ID value of RS_MYSELF indicates the attachment applies to the current process or the current kernel thread, respectively.

The following conditions must be met to successfully attach a process to a resource set:

- · The resource set must contain processors that are available in the system.
- The calling process must either have root authority or have CAP_NUMA_ATTACH capability.
- · The calling process must either have root authority or the same effective userid as the target process.
- The target process must not contain any threads that have bindprocessor bindings to a processor.
- · The resource set must be contained in (be a subset of) the target process' partition resource set.
- The resource set must be a superset of all the threads' rset in the target process.
- For R_FILDES *rstype*, the calling process must specify an open file descriptor, and it must have write access to the file, or the calling process' effective userid must be equal to the file owner's userid.
- For R SHM rstype, the calling process' effective userid must be equal to the shared segment's owner.

The following conditions must be met to successfully attach a kernel thread to a resource set:

- · The resource set must contain processors that are available in the system.
- The calling process must either have root authority or have CAP_NUMA_ATTACH capability.
- The calling process must either have root authority or the same effective userid as the target process.
- The target thread must not have bindprocessor bindings to a processor.
- The resource set must be contained in (be a subset of) the target thread's process effective and partition resource set.

If any of these conditions are not met, the attachment will fail.

Once a process is attached to a resource set, the threads in the process will only run on processors contained in the resource set. Once a kernel thread is attached to a resource set, the threads will only run on processors contained in the resource set.

Dynamic Processor Deallocation and DLPAR may invalidate the processor attachment that is being specified. A program must become DLPAR Aware to resolve this problem.

The flags parameter can be set to indicate the policy for using the resources contained in the resource set specified in the rset parameter. The only supported scheduling policy is R ATTACH STRSET, which is useful only when the processors of the system are running in simultaneous multi-threading mode. Processors like the POWER5 support simultaneous multi-threading, where each physical processor has two execution engines, called hardware threads. Each hardware thread is essentially equivalent to a single processor, and each is identified as a separate processor in a resource set. The R ATTACH STRSET flag indicates that the process is to be scheduled with a single-threaded policy; namely, that it should be scheduled on only one hardware thread per physical processor. If this flag is specified, then all of the available processors indicated in the resource set must be of exclusive use (the processor must belong to some exclusive use processor resource set). A new resource set, called an ST resource set, is constructed from the specified resource set and attached to the process according to the following rules:

- · All offline processors are ignored.
- If all the hardware threads (processors) of a physical processor (when running in simultaneous multi-threading mode, there will be more than one active hardware thread per physical processor) are not included in the specified resource set, the other processors of the processor are ignored when constructing the ST resource set.
- Only one processor (hardware thread) resource per physical processor is included in the ST resource set.

Parameters

rstype

Specifies the type of work component to be attached to the resource set specified by the rset parameter. The *rstype* parameter must be the following value, defined in **rset.h**:

R_PROCESS

Existing process

R_THREAD

Existing kernel thread

R_FILDES

File identified by an open file descriptor

R SHM

Shared memory segment identified by shared memory segment ID

R SUBRANGE

Attachment involves a subrange of the work component

rsid

Identifies the work component to be attached to the resource set specified by the rset parameter. The rsid parameter must be the following:

Process ID (for rstype of R PROCESS)

Set the *rsid_t at_pid* field to the desired process' process ID.

Kernel thread ID (for rstype of R_THREAD)

Set the rsid_t at_tid field to the desired kernel thread's thread ID.

Open file descriptor (for rstype of R_FILDES)

Set the *rsid_t at_fd* field to the desired file descriptor.

Shared memory segment ID (for rstype of R_SHM)

Set the rsid_t at_shmid field to the desired shared memory ID.

Pointer to a subrange_t struct (for rstype of R_SUBRANGE)

Set the subrange_t su_offset, su_length, su_rstype, and su_rsid fields. The other fields in the subrange_t struct are ignored. The memory allocation policy is taken from the flags parameter, not the *su_policy* field.

rset

Specifies which work component (specified by the rstype and rsid parameters) to attach to the resource set.

flags

Specifies either the memory allocation or the scheduling policy for the work component being attached. The *flags* parameter must be the following:

P_DEFAULT

Default memory policy

P_FIRST_TOUCH

First access memory policy

P BALANCED

Balanced memory policy

R ATTACH STRSET

Single-threaded scheduling policy

If the *rstype* parameter value is set to R_SUBRANGE, the memory allocation policy is specified in the **subrange_t** *su_policy* field rather than in the *flags* parameter.

The R_ATTACH_STRSET value is only applicable if the *rstype* parameter value is set to R_PROCESS. The R_ATTACH_STRSET value indicates that the process is to be scheduled with a single-threaded policy (only on one hardware thread per physical processor).

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The ra_attachrset subroutine is unsuccessful if one or more of the following are true:

EINVAL

One of the following is true:

- · The flags parameter contains an invalid value.
- The rstype parameter contains an invalid type qualifier.
- The R_ATTACH_STRSET *flags* parameter is specified and one or more processors in the *rset* parameter are not assigned for exclusive use.

ENODEV

The resource set specified by the *rset* parameter does not contain any available processors, or the R_ATTACH_STRSET *flags* parameter is specified and the constructed ST resource set does not have any available processors.

ESRCH EPERM

The process or kernel thread identified by the *rstype* and *rsid* parameters does not exist.

One of the following is true:

- If the rstype is R_PROCESS, either the resource set specified by the rset parameter is not included
 in the partition resource set of the process identified by the rstype and rsid parameters, or any of
 the thread's R_THREAD rset in this process is not a subset of the resource set specified by the
 rset parameter.
- If the *rstype* is R_THREAD, the resource set specified by the *rset* parameter is not included in the target thread's process effective or partition (real) resource set.
- · The calling process has neither root authority nor CAP_NUMA_ATTACH attachment privilege.
- The calling process has neither root authority nor the same effective user ID as the process identified by the rstype and rsid parameters.
- The process or thread identified by the rstype and rsid parameters has one or more threads with a bindprocessor processor binding.

ra detachrset Subroutine

Purpose

Detaches a work component from a resource set.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> int ra detachrset (rstype, rsid, flags) rstype t rstype; rsid_t rsid; unsigned int flags;

Description

The ra detachrset subroutine detaches a work component specified by rstype and rsid from a resource set.

The work component is an existing process identified by the process ID or an existing kernel thread identified by the kernel thread ID (tid). A process ID or thread ID value of RS_MYSELF indicates the detach command applies to the current process or the current kernel thread, respectively.

The following conditions must be met to detach a process or a kernel thread from a resource set:

- The calling process must either have root authority or have CAP_NUMA_ATTACH capability.
- · The calling process must either have root authority or the same effective userid as the target process.
- For R FILDES rstype, the calling process must specify an open file descriptor, and it must have write access to the file, or the calling process' effective userid must be equal to the file owner's userid.
- For R SHM rstype, the calling process' effective userid must be equal to the shared segment's owner.

If these conditions are not met, the operation will fail.

Once a process is detached from a resource set, the threads in the process can run on all available processors contained in the process' partition resource set. Once a kernel thread is detached from a resource set, that thread can run on all available processors contained in its process effective or partition resource set.

Parameters

rstype

Specifies the type of work component to be detached from to the resource set specified by *rset*. This parameter must be the following value, defined in **rset.h**:

- R_PROCESS: existing process
- · R_THREAD: existing kernel thread
- · R_FILDES: file identified by an open file descriptor
- · R_SHM: shared memory segment identified by shared memory segment ID
- R_SUBRANGE: attachment involves a subrange of the work component

rsid

Identifies the work component to be attached to the resource set specified by *rset*. This parameter must be the following:

- Process ID (for rstype of R_PROCESS): set the rsid_t at_pid field to the desired process' process ID.
- Kernel thread ID (for rstype of R_THREAD): set the rsid_t at_tid field to the desired kernel thread's thread ID.
- Open file descriptor (for rstype of R_FILDES); set the rsid_t at_fd field to the desired file descriptor.
- Shared memory segment ID (for rstype of R_SHM): set the rsid_t at_shmid field to the desired shared memory ID.
- Pointer to a subrange_t struct (for rstype of R_SUBRANGE): set the subrange_t su_offset, su_length, su_rstype, and su_rsid fields. The other fields in the subrange_t struct are ignored.

flags

For *rstype* of R_PROCESS, the R_DETACH_ALLTHRDS indicates that R_THREAD *rsets* are detached from all threads in a specified process. The process' effective *rset* is not detached in this case. Reserved for future use. Specify as 0.

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned, and the **errno** global variable is set to indicate the error.

Error Codes

The ra_detachrset subroutine is unsuccessful if one or more of the following are true:

EINVAL

One of the following is true:

- The flags parameter contains an invalid value.
- The rstype parameter contains an invalid type qualifier.

ESRCH

The process or kernel thread identified by the rstype and rsid parameters does not exist.

EPERM One of the following is true:

- The calling process has neither root authority nor CAP_NUMA_ATTACH attachment privilege.
- The calling process has neither root authority nor the same effective user ID as the process identified by the *rstype* and *rsid* parameters.

ra_exec Subroutine

Purpose

Executes a file and attaches it to a given resource.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int ra_execl(rstype, rsid, flags, path, argument0 [,argument1,...], 0)
rstype t rstype;
rsid t rsid;
unsigned int flags;
const char * path, argument0, argument1,...;
int ra_execle(rstype, rsid, flags, path, argument0[,argument1,...], 0, envptr)
rstype t rstype;
rsid t rsid;
unsigned int flags;
const char * path, argument0, argument1,...;
char * const envptr[];
int ra_execlp(rstype, rsid, flags, File, argument0[,argument1,...], 0)
rstype t rstype;
rsid t rsid;
unsigned int flags;
const char * File, argument0, argument1,...;
int ra_execv (rstype, rsid, flags, path, argumentv)
rstype t rstype;
rsid t rsid;
unsigned int flags;
const char * path;
char * const argumentv[];
int ra_execve (rstype, rsid, flags, path, argumentv, envptr)
rstype t rstype;
rsid_t rsid;
unsigned int flags;
const char * path;
char * const argumentv[], envptr[];
int ra execvp (rstype, rsid, flags, File, argumentv)
rstype t rstype;
rsid_t rsid;
unsigned int flags;
const char * File;
char * const argumentv[];
int ra_exect(rstype, rsid, flags, path, argumentv, envptr)
rstype_t rstype;
rsid t rsid;
unsigned int flags:
char * path, argumentv, envptr[];
```

Description

The **ra_exec** subroutine in all its forms, executes a new program in the calling process, and attaches the process to the resource specified by the *rstype* and *rsid* parameters.

The following conditions must be met to successfully attach a process to a resource set:

- The resource set must contain processors that are available in the system.
- The process must either have root authority or have CAP_NUMA_ATTACH capability.
- The calling thread must not have a bindprocessor binding to a processor.
- The resource set must be contained in (be a subset of) the process' partition resource set.

Note: When the **exec** subroutine is used, the new process image inherits its process' resource set attachments.

Dynamic Processor Deallocation and DLPAR may invalidate the processor attachment that is being specified. A program must become DLPAR Aware to resolve this problem.

The flags parameter can be set to indicate the policy for using the resources contained in the resource set specified in the rset parameter. The only supported scheduling policy is R ATTACH STRSET, which is useful only when the processors of the system are running in simultaneous multi-threading mode. Processors like the POWER5 support simultaneous multi-threading, where each physical processor has two execution engines, called hardware threads. Each hardware thread is essentially equivalent to a single processor, and each is identified as a separate processor in a resource set. The R ATTACH STRSET flag indicates that the process is to be scheduled with a single-threaded policy; namely, that it should be scheduled on only one hardware thread per physical processor. If this flag is specified, then all of the available processors indicated in the resource set must be of exclusive use (the processor must belong to some exclusive use processor resource set). A new resource set, called an ST resource set, is constructed from the specified resource set and attached to the process according to the following rules:

- · All offline processors are ignored.
- If all the hardware threads (processors) of a physical processor (when running in simultaneous multi-threading mode, there will be more than one active hardware thread per physical processor) are not included in the specified resource set, the other processors of the processor are ignored when constructing the ST resource set.
- · Only one processor (hardware thread) resource per physical processor is included in the ST resource set.

Parameters

The ra exec subroutine has the same parameters as the exec subroutine, with the addition of the following new parameters:

rstype Specifies the type of resource the new process image will be attached to. This parameter must be the following, defined in rset.h:

R_RSET: resource set

rsid Identifies the resource the new process image will be attached to. This parameter must be a resource set handle.

• Resource set ID (for rstype of R_RSET): set the rsid_t at_rset field to the target resource set. Specifies the policy to use for the process. A value of R_ATTACH_STRSET indicates that the process is to

flags

be scheduled with a single-threaded policy (only on one hardware thread per physical processor).

Return Values

The ra exec subroutine's return values are the same as the exec subroutine's return values.

Error Codes

The ra exec subroutine's error codes are the same as the exec subroutine's error codes, with the addition of the following error codes:

EINVAL One of the following is true:

- The rstype parameter contains an invalid type identifier.
- The flags parameter contains an invalid flags value.
- The R_ATTACH_STRSET flags parameter is specified and one or more processors in the rset parameter are not assigned for exclusive use.

ENODEV

The resource set specified by the rset parameter does not contain any available processors, or the R_ATTACH_STRSET flags parameter is specified and the constructed ST resource set does not have any available processors.

EFAULT Invalid address.

EPERM One of the following is true:

- The calling process has neither root authority nor CAP_NUMA_ATTACH attachment privilege.
- · The calling process contains one or more threads with a bindprocessor processor binding.
- · The specified resource set is not included in the calling process' partition resource set.

ra fork Subroutine

Purpose

Creates and attaches a new process to a given resource.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> pid t ra fork(rstype, rsid, flags) rstype t rstype; rsid t rsid; unsigned int flags;

Description

The ra fork subroutine creates a new process, and attaches the new process to the resource set specified by rstype and rsid.

The following conditions must be met to successfully attach a process to a resource set:

- · The resource set must contain processors that are available in the system.
- The process must either have root authority or have CAP_NUMA_ATTACH capability.
- The calling thread must not have a bindprocessor binding to a processor.
- The resource set must be contained in (be a subset of) the process' partition resource set.

Note: When the fork subroutine is used, the child process inherits its parent's resource set attachments.

Dynamic Processor Deallocation and DLPAR may invalidate the processor attachment that is being specified. A program must become DLPAR Aware to resolve this problem.

The flags parameter can be set to indicate the policy for using the resources contained in the resource set specified in the rset parameter. The only supported scheduling policy is R ATTACH STRSET, which is useful only when the processors of the system are running in simultaneous multi-threading mode. Processors like the POWER5 support simultaneous multi-threading, where each physical processor has two execution engines, called hardware threads. Each hardware thread is essentially equivalent to a single processor, and each is identified as a separate processor in a resource set. The R ATTACH STRSET flag indicates that the process is to be scheduled with a single-threaded policy; namely, that it should be

scheduled on only one hardware thread per physical processor. If this flag is specified, then all of the available processors indicated in the resource set must be of exclusive use (the processor must belong to some exclusive use processor resource set). A new resource set, called an ST resource set, is constructed from the specified resource set and attached to the process according to the following rules:

- · All offline processors are ignored.
- If all the hardware threads (processors) of a physical processor (when running in simultaneous multi-threading mode, there will be more than one active hardware thread per physical processor) are not included in the specified resource set, the other processors of the processor are ignored when constructing the ST resource set.
- Only one processor (hardware thread) resource per physical processor is included in the ST resource

Parameters

Specifies the type of resource the new process will be attached to. This parameter must be the following rstype value, defined in rset.h.

· R RSET: resource set.

Identifies the resource the new process will be attached to. This parameter must be a resource set handle. rsid

• Resource set ID (for rstype of R_RSET): set the rsid_t at_rset field to the desired resource set.

Specifies the policy to use for the process. A value of R_ATTACH_STRSET indicates that the process is to flags be scheduled with a single-threaded policy (only on one hardware thread per physical processor).

Return Values

The ra fork subroutine's return values are the same as the fork subroutine's return values.

Error Codes

The ra fork subroutine's error codes are the same as the fork subroutine's error codes with the addition of the following:

EINVAL One of the following is true:

- The rstype parameter contains an invalid type identifier.
- The flags parameter contains an invalid flags value.
- The R_ATTACH_STRSET flags parameter is specified and one or more processors in the rset parameter are not assigned for exclusive use.

ENODEV

The resource set specified by the rset parameter does not contain any available processors, or the R ATTACH STRSET flags parameter is specified and the constructed ST resource set does not have any available processors.

EFAULT Invalid address.

EPERM One of the following is true:

- · The calling process has neither root authority nor CAP_NUMA_ATTACH attachment privilege.
- · The calling process contains one or more threads with a bindprocessor processor binding.
- · The specified resource set is not included in the calling process' partition resource set.

ra_free_attachinfo Subroutine

Purpose

Frees the memory allocated for the attachment information returned by ra_get_attachinfo.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h>
int ra_free_attachinfo_t(info)
attachinfo_t *info;

Description

The **ra_free_attachinfo** subroutine frees the memory allocated by **ra_get_attachinfo** to contain the **attachinfo_t** structures returning the attachment information.

Parameters

info

Pointer to the **attachinfo_t** structure that was returned by a previous call to **ra_get_attachinfo**.

Return Values

On successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The ra_free_attachinfo subroutine is unsuccessful if the following is true:

EINVAL

The info parameter is a null pointer.

Related Information

The "ra_get_attachinfo Subroutine."

ra_get_attachinfo Subroutine

Purpose

Retrieves the resource set attachments to which a work component is attached.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
attachinfo_t *ra_get_attachinfo(rstype, rsid, offset, length, flags)
rstype_t rstype;
rsid_t rsid;
off64_t offset;
size64_t length;
unsigned int flags;
```

Description

The **ra_get_attachinfo** subroutine retrieves information describing the attachments involving the work component specified by *rstype* and *rsid*.

This information is returned as a null-terminated linked list of **attachinfo_t** structures. The **attachinfo_t** structures are allocated in the caller's process heap. The **ra_free_attachinfo** subroutine is provided to free the list of **attachinfo t** structures returned by **ra get attachinfo**.

The ra_get_attachinfo subroutine retrieves attachment information for the following work components:

- · A shared memory object identified by a shared memory segment ID.
- · A file identified by an open file descriptor.
- An address range in one of the above work components identified by its *offset* in the object and its *length*.

If *rstype* is a memory object and *length* has a 0 value, the attachment information returned is for the last portion of the memory object, beginning with *offset*.

Note: Resource set attachments can change during or after **ra_get_attachinfo** retrieves them. There is no guarantee that the returned attachments still exist, or that all existing attachments were retrieved.

Parameters

rstype

Specifies the type of work component for which the attachment information is to be retrieved. This parameter can have one of the following values:

R SHM

Attachment information of a shared memory, identified by its shared memory identifier, is to be retrieved.

R_FILDES

Attachment information of a file, identified by its open file descriptor, is to be retrieved.

Identifies the work component for which the attachment information is to be retrieved. This parameter can be one of the following:

- shared memory segment ID (if the value of rstype is R_SHM)
- open file descriptor (if the value of rstype is R_FILDES)

rsid

0	ffs	ρt

Specifies the offset of a range within a memory object for which the attachment information is to be retrieved. This parameter is taken into account only for the following values of *rstype*:

- · R_SHM: starting offset within the shared memory object identified by rsid
- · R_FILDES: absolute offset within the file identified by rsid

Specifies the length of a range within a memory object for which the attachment information is to be retrieved. This parameter is taken into account only for the following values of rstype:

- · R_SHM: length of a range within the shared memory object identified by rsid
- R_FILDES: length of a range within the file identified by

Reserved for future use. Specify as 0.

length

flags

Return Values

On successful completion, a pointer to the first element in a null-terminated list of attachinfo_t structures is returned. A null pointer is returned if the work component does not have any attachments. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The ra_get_attachinfo subroutine is unsuccessful if one or more of the following are true:

EINVAL

One of the following conditions is true:

- The flags parameter contains an invalid value.
- The rstype parameter contains an invalid type qualifier.
- The rstype parameter is R_SHM and rsid is not a valid shared memory segment.

EBADF

The rstype parameter is R_FILDES and rsid is not a valid open file descriptor.

Related Information

The "ra_attachrset Subroutine" on page 11, "ra_detachrset Subroutine" on page 14, "ra_free_attachinfo Subroutine" on page 20.

ra_getrset Subroutine

Purpose

Gets the resource set to which a work component is attached.

Library

Standard C library (libc.a)

Syntax

```
# include <sys/rset.h>
int ra_getrset (rstype, rsid, flags, rset)
rstype_t rstype;
rsid_t rsid;
unsigned int flags;
rsethandle_t rset;
```

Description

The ra_getrset subroutine returns the resource set to which a specified work component is attached.

The work component is an existing process identified by the process ID or an existing kernel thread identified by the kernel thread ID (tid). A process ID or thread ID value of RS_MYSELF indicates the resource set attached to the current process or the current kernel thread, respectively, is requested.

The following return values from the ra_getrset subroutine indicate the type of resource set returned:

- A value of RS_EFFECTIVE_RSET indicates the process was explicitly attached to the resource set. This may have been done with the **ra_attachrset** subroutine.
- A value of RS_PARTITION_RSET indicates the process was not explicitly attached to a resource set.
 However, the process had an explicitly set partition resource set. This may be set with the
 rs_setpartition subroutine or through the use of Workload Manager (WLM) work classes with resource
 sets.
- A value of RS_DEFAULT_RSET indicates the process was not explicitly attached to a resource set nor
 did it have an explicitly set partition resource set. The system default resource set is returned.
- A value of RS_THREAD_RSET indicates the kernel thread was explicitly attached to the resource set. This might have been done with the **ra_attachrset** subroutine.
- A value of RS_THREAD_PARTITION_RSET indicates that the kernel thread was not explicitly attached
 to a resource set. However, the thread had an explicitly set partition resource set. This was set through
 the use of WLM work classes with resource sets.

Parameters

Specifies the type of the work component whose resource set attachment is requested. This parameter must be the following value, defined in **rset.h**:

- · R_PROCESS: existing process
- · R_THREAD: existing kernel thread

rsid

rstype

Identifies the work component whose resource set attachment is requested. This parameter must be the following:

- Process ID (for rstype of R_PROCESS): set the rsid_t at_pid field to the desired process' process ID.
- Kernel thread ID (for rstype of R_THREAD): set the rsid_t at_tid field to the desired kernel thread's thread ID.

flags

Reserved for future use. Specify as 0.

rset

Specifies the resource set to receive the work component's resource set.

Return Values

If successful, a value of RS_EFFECTIVE_RSET, RS_PARTITION_RSET, RS_THREAD_RSET, RS_THREAD_RSET, or RS_DEFAULT_RSET is returned. If unsuccessful, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The ra_getrset subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following is true:

· The flags parameter contains an invalid value.

· The rstype parameter contains an invalid type qualifier.

EFAULT Invalid address.

ESRCH The process or kernel thread identified by the *rstype* and *rsid* parameters does not exist.

Related Information

The "rs_getpartition Subroutine" on page 113.

ra_mmap or ra_mmapv Subroutine

Purpose

Maps a file or anonymous memory region into the process-address space and attaches the file or memory region to a given resource.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/rset.h>
#include <sys/mman.h>
void * ra mmap( addr, len, prot, flags, fildes, off, rstype, rsid, att flags )
void *addr;
off64_t len;
int prot;
int flags;
int fildes;
off64 t off;
rstype t rstype;
rsid_t rsid;
unsigned int att flags;
void * ra mmapv( addr, len, prot, flags, fildes, off, rangecnt, rangevec )
void *addr;
off64_t len;
int prot;
int flags;
int fildes;
off64 t off;
int rangecnt;
subrange_t *rangevec;
```

Description

The **ra_mmap** subroutine maps the file or memory region, specified by *mmap_params*, into the process-address space and attaches it to the resource set specified by *rstype* and *rsid*. The resource set specified for attachment defines the resource allocation domains (RADs) from which the mapping's memory demands should be fulfilled. If the file or memory region is attached to a resource set specifying multiple RADs, its memory allocation is distributed among these RADs according to *att_flags*.

If a file is being mapped, the attachment for the new mapped region is reflected down to the portion of the file it maps and persists after the region is unmapped. The file's attachment persists until the last **close** of the file.

The **ra_mmapv** subroutine is similar to the **ra_mmap** subroutine, and allows multiple subranges of a file or memory region to be attached to different resource sets in a single **ra mmapv** call.

The *rangecnt* argument specifies the number of subranges being mapped. The *rangevec* argument is a pointer to an array of **subrange_t** structures describing the attachments to be performed. Each **subrange_t** structure specifies a portion of the file or memory region and the resource set to which the portion should be attached. If overlapping subranges are specified, **ra_mmapv** does not fail, but its behavior is undefined.

Child processes inherit all mapped regions and their resource set attachments from the parent process when the **fork** subroutine is called. The child process also inherits the same sharing and protection attributes for these mapped regions. A successful call to any **exec** subroutine unmaps all mapped regions created with the **ra_mmap** subroutine.

Attachments to a given RAD do not attach the process to the processors in that RAD. Attachments are only advisory; memory from a different RAD can be provided if the demand cannot be fulfilled from the RAD specified.

If overlapping subranges are mapped with attachments, the memory placement of the mapped regions is undefined.

The *su_rsoffset* and *su_rslength* fields of the **subrange_t** structures must be set to 0. Otherwise, **ra_mmapv** fails with **EINVAL**.

Parameters

addr

Specifies the starting address of the memory region to be mapped. When the **MAP_FIXED** flag is specified, this address must be a multiple of the page size returned by the **sysconf** subroutine using the **_SC_PAGE_SIZE** value for the *Name* parameter. A region is never placed at address 0, or at an address where it would overlap an existing region. Specifies how memory allocation is distributed among the RADs.

att_flags fildes

Specifies the file descriptor of the file-system object or of the shared memory object to be mapped. If the MAP_ANONYMOUS flag is set, the *fildes* parameter must be -1. After the successful completion of the **ra_mmap** or **ra_mmapv** subroutine, the file or the shared memory object specified by the *fildes* parameter can be closed without affecting the mapped region or the contents of the mapped file. Each mapped region creates a file reference, similar to an open file descriptor, which prevents the file data from being deallocated.

flags

Specifies attributes of the mapped region. Values for the flags parameter are constructed by a bitwise-inclusive ORing of values from the following list of symbolic names defined in the sys/mman.h file:

MAP_FILE

Specifies the creation of a new mapped file region by mapping the file associated with the fildes file descriptor. The mapped region can extend beyond the end of the file, both at the time when the ra_mmap subroutine is called and while the mapping persists. This situation could occur if a file with no contents was created just before the call to the ra_mmap subroutine, or if a file was later truncated. However, references to whole pages following the end of the file result in the delivery of a SIGBUS signal. Only one of the MAP_FILE and MAP_ANONYMOUS flags must be specified with the ra_mmap or ra_mmapv subroutine.

MAP_ANONYMOUS

Specifies the creation of a new, anonymous memory region that is initialized to all zeros. This memory region can be shared only with the descendants of the current process. When using this flag, the fildes parameter must be -1. Only one of the MAP_FILE and MAP_ANONYMOUS flags must be specified with the ra_mmap or ra_mmapvsubroutine.

MAP_VARIABLE

Specifies that the system select an address for the new memory region if the new memory region cannot be mapped at the address specified by the addr parameter, or if the addr parameter is null. Only one of the MAP_VARIABLE and MAP_FIXED flags must be specified with the ra_mmap or ra_mmapv subroutine.

MAP_FIXED

Specifies that the mapped region be placed exactly at the address specified by the addr parameter. If the application has requested SPEC1170 complaint behavior and the **ra_mmap** or **ra_mmapv** request is successful, the mapping replaces any previous mappings for the process' pages in the specified range. If the application has not requested SPEC1170 compliant behavior and a previous mapping exists in the range, the request fails. Only one of the MAP_VARIABLE and MAP_FIXED flags must be specified with the ra_mmap or ra_mmapv subroutine.

MAP SHARED

When the MAP_SHARED flag is set, modifications to the mapped memory region will be visible to other processes that have mapped the same region using this flag. If the region is a mapped file region, modifications to the region will be written to the

You can specify only one of the MAP SHARED or MAP PRIVATE flags with the ra mmap or ra mmapv subroutine. MAP PRIVATE is the default setting when neither flag is specified unless you request SPEC1170 compliant behavior. In this case, you must choose either MAP_SHARED or MAP_PRIVATE.

MAP PRIVATE

When the MAP PRIVATE flag is specified, modifications to the mapped region by the calling process are not visible to other processes that have mapped the same region. If the region is a mapped file region, modifications to the region are not written to the file.

If this flag is specified, the initial write reference to an object page creates a private copy of that page and redirects the mapping to the copy. Until then, modifications to the page by processes that have mapped the same region with the MAP SHARED flag are visible.

You can specify only one of the MAP_SHARED or MAP_PRIVATE flags with the ra mmap or ra mmapv subroutine. MAP PRIVATE is the default setting when neither flag is specified unless you request SPEC1170 compliant behavior. In this case, you must choose either MAP SHARED or MAP PRIVATE.

Specifies the length, in bytes, of the memory region to be mapped. The system performs mapping operations over whole pages only. If the len parameter is not a multiple of the page size, the system will include in any mapping operation the address range between the end of the region and the end of the page containing the end of the region.

len

off

Specifies the file byte offset at which the mapping starts. This offset must be a multiple of the page size returned by the **sysconf** subroutine using the **_SC_PAGE_SIZE** value for the *Name* parameter.

policy

prot

Specifies an advisory memory allocation policy that is to be applied. This parameter must have one of the following values defined in **sys/rset.h**:

P_FIRST_TOUCH

First Access memory policy. Memory is allocated from the RAD of the processor on which it is accessed the first time if this RAD is in the attachment resource set. Otherwise, memory is allocated from any RAD with memory available to the processor.

P BALANCED

Balanced memory policy. Memory is allocated in a round robin manner across the RADs contained in the attachment resource set.

P DEFAULT

Default memory placement policy.

Specifies the access permissions for the mapped region. The **sys/mman.h** file defines the following access options:

PROT_READ

Region can be read.

PROT WRITE

Region can be written.

PROT_EXEC

Region can be executed.

PROT_NONE

Region cannot be accessed.

The *prot* parameter can be the **PROT_NONE** flag, or any combination of the **PROT_READ** flag, **PROT_WRITE** flag, and **PROT_EXEC** flag logically ORed together. If the **PROT_NONE** flag is not specified, access permissions can be granted to the region in addition to those explicitly requested. However, write access will not be granted unless the **PROT_WRITE** flag is specified.

Note: The operating system generates a SIGSEGV signal if a program attempts an access that exceeds the access permission given to a memory region. For example, if the PROT_WRITE flag is not specified and a program attempts a write access, a SIGSEGV signal results. If the region is a mapped file that was mapped with the MAP_SHARED flag, the ra_mmap or ra_mmapv subroutine grants read or execute access permission only if the file descriptor used to map the file was opened for reading. It grants write access permission only if the file descriptor was opened for writing. If the region is a mapped file that was mapped with the MAP_PRIVATE flag, the ra_mmap or ra_mmapv subroutine grants read, write, or execute access permission only if the file descriptor used to map the file was opened for reading. If the region is an anonymous memory region, the ra_mmap or ra_mmapv subroutine grants all requested access permissions.

rangecnt rangevec

Specifies the number of $subrange_t$ structures pointed to by rangevec.

Specifies a pointer to an array of **subrange_t** structures describing the desired subrange attachments.

Identifies the resource set to which the file or memory region is to be attached. This structure must contain a resource set handle of an existing resource set. Attachments to resources are advisory. If memory cannot be allocated from the RADs contained in the attachment resource set, memory is allocated from any RAD in the system that has memory available. Specifies the type of resource the file or memory region is to be attached to. This parameter must have the resource set value **R_RSET**, defined in **sys/rset.h**.

rstype

rsid

27

Return Values

Upon successful completion, an address to the mapped file or memory region is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

EACCES The file referred to by the fildes parameter is not open for read access, or the file is not open for

write access and the PROT WRITE flag was specified for a MAP SHARED mapping operation.

Or, the file to be mapped has enforced locking enabled and the file is currently locked.

EAGAIN The *fildes* parameter refers to a device that has already been mapped.

The fildes parameter is not a valid file descriptor, or the MAP ANONYMOUS flag was set and the **EBADF**

fildes parameter is not -1.

EFBIG The mapping requested extends beyond the maximum file size associated with fildes.

EINVAL The flags or prot parameter is invalid, or the addr parameter or off parameter is not a multiple of

the page size returned by the sysconf subroutine using the SC PAGE SIZE value for the Name

EINVAL The application has requested SPEC1170 compliant behavior and the value of flags is invalid

(neither MAP_PRIVATE nor MAP_SHARED is set).

EINVAL The **subrange_t** structure specifies an invalid range.

The su_rsoffset and su_rslength fields of a subrange_t do not have a value of 0. **EINVAL**

EINVAL The resource type is invalid (is not of type **R_RSET**).

The application has requested SPEC1170 compliant behavior and the value of flags is invalid **EINVAL**

(neither MAP_PRIVATE nor MAP_SHARED is set).

EMFILE The application has requested SPEC1170 compliant behavior and the number of mapped regions

would exceed an implementation-dependent limit (per process or per system).

ENODEV The *fildes* parameter refers to an object that cannot be mapped, such as a terminal.

ENOMEM There is not enough address space to map len bytes, or the application has not requested Single

UNIX Specification, Version 2 compliant behavior and the MAP_FIXED flag was set and part of the

address-space range (addr, addr+len) is already allocated.

ENOSYS The ra_mmap subroutine is not supported on the system.

ENOSYS The file specified is of a type that does not support physical attachments.

ENXIO The addresses specified by the range (off, off+len) are invalid for the fildes parameter.

EOVERFLOW The mapping requested extends beyond the offset maximum for the file description associated with

EPERM The calling process does not have the necessary attachment privileges.

The mkrset Command.

ra shmget and ra shmgetv Subroutines

Purpose

Gets a shared memory segment and attaches it to a resource.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
#include <sys/shm.h>

int ra_shmget(key, size, flags, rstype, rsid, att_flags)
key_t key;
size64_t size;
int flags;
rstype_t rstype;
rsid_t rsid;
unsigned int att_flags;
int ra_shmgetv(key, size, flags, rangecnt, rangevec)
key_t key;
size64_t size;
int flags;
int rangecnt;
subrange t *rangevec;
```

Parameters

As per existing **shmget** usage, plus the following new parameters:

rstype Specifies the type of resource the new shared memory segment is to be attached to. This parameter must have the resource set value **R_RSET**; defined in **sys/rset.h**.

rsid Identifies the resource to which the new shared memory segment is to be attached. This

parameter must be a resource set handle of an existing resource set. If memory cannot be allocated from the RADs contained in the attachment resource set, memory is allocated from any

RAD in the system that has memory available.

att_flags Specifies an advisory memory allocation policy that is to be applied to the new shared memory segment. This parameter must have one of the following values defined in sys/rset.h:

 P_FIRST_TOUCH: First Access memory policy. Memory is allocated from the current node, the RAD of the processor on which it is accessed for the first time, if this RAD is in the attachment resource set. If it is not, memory is allocated form an undefined RAD in the attachment resource set.

- P_BALANCED: Balanced memory policy. Memory is allocated in a round robin manner across
 the RADs contained in the attachment resource set.
- · P_DEFAULT: Default memory placement policy.

rangecnt Specifies the number of **subrange t** structures pointed to by rangevec.

Specifies a pointer to an array of **subrange_t** structures describing the desired subrange

attachments.

Description

rangevec

The **ra_shmget** subroutine returns the shared memory identifier associated with the specified *key*, *size* and *flags* parameters, attaching it to the logical or physical resource set (**R_RSET**) specified by *rstype* and *rsid*. If the shared memory is attached to a set of physical resources involving multiple resource allocation domains (RADs), its memory allocation is distributed among these RADs according to *att_flags*. The processors listed in a resource set are used for memory associativity; **rset** memory regions are ignored. Any memory allocation policy is advisory.

If the new shared memory segment is to be attached in its entirety to a resource (that is, no subranges are involved), then the *rstype* parameter is of type **R_RSET** and the *rsid* parameter is a resource set handle.

The **ra_shmgetv** subroutine is similar to the **ra_shmget** subroutine, and allows multiple subranges of the new shared memory segment to be attached to multiple resources in a single **ra_shmgetv** call. The *rangevec* argument is a pointer to an array of **subrange_t** structures describing the attachments to be performed. The *rangecnt* argument specifies the number of **subrange_t** structures pointed to by *rangevec*. All unused **subrange_t** structure fields, including those marked as reserved, must be initialized to the value of 0. Although it is not failing, the behavior with overlapping subranges is undefined.

Return Values

On successful completion, a shared memory identifier is returned. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

As per existing **shmget** usage, plus the following errors:

EINVAL

One of the following conditions is true:

- · rstype contains an invalid type qualifier.
- · Invalid subrange fields.
- att_flags contains an invalid flag.

EPERM

One of the following conditions is true:

- The calling process has neither root authority nor CAP_NUMA_ATTACH privilege.
- The resource specified by rstype and rsid is not included in the calling process's partition resource set.

Examples

The following example attempts to use **ra_shmgetv** to create a **shmat** attachable shared memory region, whose first 32 megabytes are distributed using the P_BALANCED policy and the next 48 megabytes using the P_FIRST_TOUCH policy.

```
int flags, shm id;
char *shm at;
rsethandle t rsetid;
subrange t subranges[2] = { 0 };
rsetid = rs alloc(RS PARTITION);
subranges [0] .su offset = 0x00000000;
subranges [0] .su length = 0x2000000;
subranges[0].su rstype = R RSET;
subranges[0].su_rsid.at_rset = rsetid;
subranges[0].su_policy = P_BALANCED;
subranges[1].su offset = 0x2000000;
subranges [1].su length = 0x3000000;
subranges[1].su rstype = R RSET;
subranges[1].su rsid.at rset = rsetid;
subranges[1].su_policy = P_FIRST_TOUCH;
flags = (IPC CREAT | SHM PIN);
shm_id = ra_shmgetv (IPC_PRIVATE, 0x5000000, flags,
sizeof(subranges) / sizeof(subrange_t), subranges
);
if (shm id == -1)
perror("ra shmgetv failed!\n");
exit(1);
```

The mkrset Command.

ras_callback Registered Callback

Purpose

Component callback registered through the *ras_register* kernel service.

Syntax

Description

The component trace framework calls the **ras_callback** function each time an external event modifies a property of the component. Each component that calls the *ras_register* kernel service with a non-zero flags parameter must have the **ras_callback** registered callback function. Valid callback commands are those defined for individual RAS domains, such as Component Trace.

Note that the callback for a particular component does not have to be aware of, or act on, the children of the component as they have their own callbacks. Callbacks, in general, only do things relevant to the component for which they were called.

Parameters

ras_blk The target control block pointer.

command The command to act on. Commands are specific to a given RAS domain, such as

Component Trace.

arg Optional pointer to an argument needed for the given command.

private data Pointer to component-private data, specifically the pointer registered in the ras_register

kernel service.

Return Values

ras_callback return 0 for success. Any other return value is a diagnostic error code from the component.

Execution Environment

Registrants must be aware that certain callbacks can be used at less than the interrupt priority of **INTBASE**, depending on what RAS domains the component is registered for. This depends on the designs for the domains involved. Because of the variability here, callbacks should be defined in a pinned object file.

read, readx, readvx, pread, or preadv Subroutine

Purpose

Reads from a file.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
ssize_t read (FileDescriptor,
Buffer, NBytes)
int FileDescriptor;
void * Buffer;
size_t NBytes;
int readx (FileDescriptor, Buffer, NBytes, Extension)
int FileDescriptor;
char * Buffer;
unsigned int NBytes;
int Extension;
ssize_t pread (int fildes, void *buf, size_t nbyte, off_t offset);
#include <sys/uio.h>
ssize t readv (FileDescriptor, iov, iovCount)
int FileDescriptor;
const struct iovec * iov;
int iovCount:
ssize t readvx (FileDescriptor, iov, iovCount, Extension)
int FileDescriptor;
struct iovec *iov;
int iovCount;
int Extension;
#include <unistd.h>
#include <sys/uio.h>
ssize t preadv (
int FileDescriptor,
const struct iovec * iov,
int iovCount.
offset_t offset);
```

Description

The read subroutine attempts to read NBytes of data from the file associated with the FileDescriptor parameter into the buffer pointed to by the *Buffer* parameter.

The **readv** subroutine performs the same action but scatters the input data into the *iovCount* buffers specified by the array of **iovec** structures pointed to by the *iov* parameter. Each **iovec** entry specifies the base address and length of an area in memory where data should be placed. The readv subroutine always fills an area completely before proceeding to the next.

The **readx** and **readvx** subroutines are the same as the **read** and **readv** subroutines, respectively, with the addition of an Extension parameter, which is needed when reading from some device drivers and when reading directories. While directories can be read directly, it is recommended that the opendir and readdir calls be used instead, as this is a more portable interface.

On regular files and devices capable of seeking, the read starts at a position in the file given by the file pointer associated with the FileDescriptor parameter. Upon return from the read subroutine, the file pointer is incremented by the number of bytes actually read.

Devices that are incapable of seeking always read from the current position. The value of a file pointer associated with such a file is undefined.

On directories, the readvx subroutine starts at the position specified by the file pointer associated with the File Descriptor parameter. The value of this file pointer must be either 0 or a value which the file pointer had immediately after a previous call to the readvx subroutine on this directory. Upon return from the readvx subroutine, the file pointer increments by a number that may not correspond to the number of bytes copied into the buffers.

When attempting to read from an empty pipe (first-in-first-out (FIFO)):

- If no process has the pipe open for writing, the read returns 0 to indicate end-of-file.
- If some process has the pipe open for writing:
 - If O NDELAY and O NONBLOCK are clear (the default), the read blocks until some data is written or the pipe is closed by all processes that had opened the pipe for writing.
 - If O NDELAY is set, the read subroutine returns a value of 0.
 - If O NONBLOCK is set, the read subroutine returns a value of -1 and sets the global variable errno to **EAGAIN**.

When attempting to read from a character special file that supports nonblocking reads, such as a terminal, and no data is currently available:

- If O NDELAY and O NONBLOCK are clear (the default), the read subroutine blocks until data becomes available.
- If O NDELAY is set, the read subroutine returns 0.
- . If O_NONBLOCK is set, the read subroutine returns -1 and sets the errno global variable to EAGAIN if no data is available.

When attempting to read a regular file that supports enforcement mode record locks, and all or part of the region to be read is currently locked by another process:

- If O_NDELAY and O_NONBLOCK are clear, the read blocks the calling process until the lock is released.
- If O_NDELAY or O_NONBLOCK is set, the read returns -1 and sets the global variable errno to EAGAIN.

The behavior of an interrupted read subroutine depends on how the handler for the arriving signal was installed.

If the handler was installed with an indication that subroutines should not be restarted, the read subroutine returns a value of -1 and the global variable errno is set to EINTR (even if some data was already consumed).

If the handler was installed with an indication that subroutines should be restarted:

- · If no data had been read when the interrupt was handled, this read will not return a value (it is restarted).
- · If data had been read when the interrupt was handled, this read subroutine returns the amount of data consumed.

The pread function performs the same action as read, except that it reads from a given position in the file without changing the file pointer. The first three arguments to pread are the same as read with the

addition of a fourth argument offset for the desired position inside the file. An attempt to perform a pread on a file that is incapable of seeking results in an error.

Note: The pread64 subroutine applies to AIX 4.3 and later. ssize_t pread64(int fildes , void *buf , size_t nbytes , off64_t offset)

The pread64 subroutines performs the same action as pread but the limit of offset to the maximum file size for the file associated with the file Descriptor and DEV OFF MAX if the file associated with fileDescriptor is a block special or character special file. If fildes refers to a socket, read is equivalent to the **recv** subroutine with no flags set.

Using the read or pread subroutine with a file descriptor obtained from a call to the shm open subroutine fails with ENXIO.

The **preadv** subroutine performs the same action as the **readv** subroutine, except that the **preadv** subroutine reads from a given position in the file without changing the file pointer. The first three arguments of the preadv subroutine are the same as the readv subroutine with an addition of the offset argument for the desired position inside the file. An error occurs when the file that the pready subroutine reads from is incapable of seeking.

Parameters

FileDescriptor Extension

A file descriptor identifying the object to be read.

Provides communication with character device drivers that require additional information or return additional status. Each driver interprets the Extension parameter in a device-dependent way, either as a value or as a pointer to a communication area. Drivers must apply reasonable defaults when the value of the Extension parameter is 0.

For directories, the Extension parameter determines the format in which directory entries should be returned:

- If the value of the Extension parameter is 0, the format in which directory entries are returned depends on the value of the real directory read flag (described in the ulimit ("ulimit Subroutine" on page 488) subroutine).
- · If the calling process does not have the real directory read flag set, the buffers are filled with an array of directory entries truncated to fit the format of the System V directory structure. This provides compatibility with programs written for UNIX System
- If the calling process has the real directory read flag set (see the ulimit subroutine), the buffers are filled with an image of the underlying implementation of the directory.
- If the value of the Extension parameter is 1, the buffers are filled with consecutive directory entries in the format of adirent structure. This is logically equivalent to the readdir subroutine.
- Other values of the Extension parameter are reserved.

For tape devices, the Extension parameter determines the response of the readx subroutine when the tape drive is in variable block mode and the read request is for less than the tape's block size.

- If the value of the Extension parameter is TAPE SHORT READ, the readx subroutine returns the number of bytes requested and sets the errno global variable to a value of
- If the value of the Extension parameter is 0, the readx subroutine returns a value of 0 and sets the errno global variable to ENOMEM.

iov Points to an array of iovec structures that identifies the buffers into which the data is to

be placed. The iovec structure is defined in the sys/uio.h file and contains the following

members:

caddr_t iov_base;
size_t iov_len;

iovCount Specifies the number of iovec structures pointed to by the iov parameter.

Buffer Points to the buffer.

NBytes Specifies the number of bytes read from the file associated with the FileDescriptor

parameter.

Note: When reading tapes, the **read** subroutines consume a physical tape block on each call to the subroutine. If the physical data block size is larger than specified by the *Nbytes* parameter, an error will be returned, since all of the data from the read will not fit into the

buffer specified by the read.

To avoid read errors due to unknown blocking sizes on tapes, set the NBytes parameter

to a very large value (such as 32K bytes).

offset The position in the file where the reading begins.

Return Values

Upon successful completion, the **read**, **readx**, **readv**, **readvx**, **pread**, and **preadv** subroutines return the number of bytes actually read and placed into buffers. The system guarantees to read the number of bytes requested if the descriptor references a normal file that has the same number of bytes left before the end of the file is reached, but in no other case.

A value of 0 is returned when the end of the file has been reached. (For information about communication files, see the **ioctl** and **termio** files.)

Otherwise, a value of -1 is returned, the global variable **errno** is set to identify the error, and the content of the buffer pointed to by the *Buffer* or *iov* parameter is indeterminate.

Error Codes

The **read**, **readv**, **readvx**, **pread**, and **preadv** subroutines are unsuccessful if one or more of the following are true:

EBADMSG The file is a STREAM file that is set to control-normal mode and the message waiting to be read

includes a control part.

EBADF The *FileDescriptor* parameter is not a valid file descriptor open for reading.

EINVAL The file position pointer associated with the *FileDescriptor* parameter was negative.

EINVAL The sum of the **iov** len values in the *iov* array was negative or overflowed a 32-bit integer.

EINVAL The value of the *iovCount* parameter was not between 1 and 16, inclusive.

EINVAL The value of the *Nbytes* parameter that is larger than OFF_MAX, was requested on the 32-bit kernel.

This is a case where the system call is requested from a 64-bit application that is running on a 32-bit

kernel.

EINVAL The STREAM or multiplexer referenced by FileDescriptor is linked (directly or indirectly) downstream

from a multiplexer.

EAGAIN The file was marked for non-blocking I/O, and no data was ready to be read.

EFAULT The *Buffer* or part of the *iov* points to a location outside of the allocated address space of the process.

EFAULT The user does not have authority to access the *Buffer*.

EDEADLK A deadlock would occur if the calling process were to sleep until the region to be read was unlocked. **EINTR** A **read** was interrupted by a signal before any data arrived, and the signal handler was installed with

an indication that subroutines are not to be restarted.

EIO An I/O error occurred while reading from the file system.

EIO The process is a member of a background process attempting to read from its controlling terminal, and

either the process is ignoring or blocking the SIGTTIN signal or the process group has no parent

process.

EFBIG An offset greater than MAX_FILESIZE was requested on the 32-bit kernel.

The read or pread subroutine was used with a file descriptor obtained from a call to the shm_open **ENXIO**

subroutine.

EOVERFLOW

An attempt was made to read from a regular file where NBytes was greater than zero and the starting offset was before the end-of-file and was greater than or equal to the offset maximum established in the open file description associated with FileDescriptor.

The read, ready, ready, ready, pread, and pready subroutines might be unsuccessful if the following is true:

ENXIO A request was made of a nonexistent device, or the request was outside the capabilities of the device.

ESPIPE fildes is associated with a pipe or FIFO.

If Network File System (NFS) is installed on the system, the read system call can also fail if the following is true:

ETIMEDOUT The connection timed out.

The **readv** subroutine can also be unsuccessful if the following error code is true:

EINVAL The value of the *iovCount* parameter is greater than 15.

The fcntl, dup, or dup2 subroutine, ioctl subroutine, lockfx subroutine, lseek subroutine, open, openx, or creat subroutine, opendir, readdir, or seekdir subroutine, pipe subroutine, poll subroutine, socket subroutine, socketpair subroutine.

The Input and Output Handling in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

readdir r Subroutine

Purpose

Reads a directory.

Library

Thread-Safe C Library (libc_r.a)

Syntax

```
#include <svs/tvpes.h>
#include <dirent.h>
int readdir_r (DirectoryPointer, Entry, Result)
DIR * DirectoryPointer;
struct dirent * Entry;
struct dirent ** Result;
```

Description

The **readdir_r** subroutine returns the directory entry in the structure pointed to by the *Result* parameter. The readdir_r subroutine returns entries for the . (dot) and .. (dot-dot) directories, if present, but never returns an invalid entry (with d ino set to 0). When it reaches the end of the directory, the readdir_r subroutine returns 9 and sets the *Result* parameter to NULL. When it detects an invalid **seekdir** operation, the **readdir** r subroutine returns a 9.

Note: The readdir subroutine is reentrant when an application program uses different DirectoryPointer parameter values (returned from the opendir subroutine). Use the readdir_r subroutine when multiple threads use the same directory pointer.

Using the readdir_r subroutine after the closedir subroutine, for the structure pointed to by the DirectoryPointer parameter, has an undefined result. The structure pointed to by the DirectoryPointer parameter becomes invalid for all threads, including the caller.

Programs using this subroutine must link to the **libpthreads.a** library.

Parameters

DirectoryPointer Points to the **DIR** structure of an open directory.

Entry Points to a structure that contains the next directory entry. Result Points to the directory entry specified by the *Entry* parameter.

Return Values

Indicates that the subroutine was successful.

Indicates that the subroutine was not successful or that the end of the directory was reached. If the user has set the environment variable XPG SUS ENV=ON prior to execution of the process, then the SIGXFSZ signal is posted to the process when exceeding the process' file size limit, and the subroutine will always be successful.

Error Codes

If the readdir_r subroutine is unsuccessful, the errno global variable is set to one of the following values:

EACCES Search permission is denied for any component of the structure

pointed to by the *DirectoryPointer* parameter, or read permission is

denied for the structure pointed to by the DirectoryPointer

parameter.

ENAMETOOLONG The length of the *DirectoryPointer* parameter exceeds the value of

the PATH MAX variable, or a path-name component is longer

than the value of NAME MAX variable while the

_POSIX_NO_TRUNC variable is in effect.

ENOENT The named directory does not exist.

ENOTDIR A component of the structure pointed to by the *DirectoryPointer*

parameter is not a directory.

EMFILE Too many file descriptors are currently open for the process. **ENFILE** Too many file descriptors are currently open in the system. **EBADF** The structure pointed to by the *DirectoryPointer* parameter does

not refer to an open directory stream.

Examples

To search a directory for the entry name, enter:

```
len = strlen(name);
DirectoryPointer = opendir(".");
for (readdir r(DirectoryPointer, &Entry, &Result); Result != NULL;
 readdir_r(DirectoryPointer, &Entry, &Result))
        if (dp->d namlen == len && !strcmp(dp->d name, name)) {
                closedir(DirectoryPointer);
                return FOUND;
closedir(DirectoryPointer);
return NOT FOUND;
```

readlink Subroutine

Purpose

Reads the contents of a symbolic link.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
int readlink ( Path, Buffer, BufferSize)
const char *Path;
char *Buffer;
size t BufferSize;
```

Description

The **readlink** subroutine copies the contents of the symbolic link named by the *Path* parameter in the buffer specified in the Buffer parameter. The BufferSize parameter indicates the size of the buffer in bytes. If the actual length of the symbolic link is less than the number of bytes specified in the BufferSize parameter, the string copied into the buffer will be null-terminated. If the actual length of the symbolic link is greater than the number of bytes specified in the *Buffersize* parameter, an error is returned. The length of a symbolic link cannot exceed 1023 characters or the value of the PATH_MAX constant. PATH_MAX is defined in the limits.h file.

Parameters

Path Specifies the path name of the destination file or directory.

Buffer Points to the user's buffer. The buffer should be at least as large as the BufferSize parameter. **BufferSize** Indicates the size of the buffer. The contents of the link are null-terminated, provided there is

room in the buffer.

Return Values

Upon successful completion, the **readlink** subroutine returns a count of the number of characters placed in the buffer (not including any terminating null character). If the **readlink** subroutine is unsuccessful, the buffer is not modified, a value of -1 is returned, and the **errno** global variable is set to indicate the error.

Error Codes

The **readlink** subroutine fails if one or both of the following are true:

ENOENT The file named by the *Path* parameter does not exist, or the path points to an empty string.

EINVAL The file named by the *Path* parameter is not a symbolic link.

ERANGE The path name in the symbolic link is longer than the *BufferSize* value.

The **readlink** subroutine can also fail due to additional errors. See "Base Operating System Error Codes for Services that Require Path-Name Resolution" for a list of additional error codes.

The **readlink** subroutine can also fail due to additional errors. See Appendix A,"Base Operating System Error Codes for Services That Require Path-Name Resolution" on page A-1 for a list of additional error codes.

If Network File System (NFS) is installed on the system, the **readlink** subroutine can also fail if the following is true:

ETIMEDOUT The connection timed out.

Related Information

The In command.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

read_real_time, read_wall_time or time_base_to_time Subroutine

Purpose

Read the processor real time clock or time base registers to obtain high-resolution elapsed time.

Library

Standard C Library (libc.a)

Syntax

Description

These subroutines are designed to be used for making high-resolution measurement of elapsed time, using the processor real time clock or time base registers. The <code>read_real_time</code> subroutine reads the value of the appropriate registers and stores them in a structure. The <code>read_wall_time</code> subroutine returns the monotonically increasing time base value. The <code>time_base_to_time</code> subroutine converts time base data to real time, if necessary. This process is divided into two steps because the process of reading the time is usually part of the timed code, and so the conversion from time base to real time can be moved out of the timed code.

The **read_real_time** subroutine reads either the processor real time clock (for the POWER family or PowerPC 601 RISC Microprocessor in AIX 5.1 and earlier) or the time base register (in the case of the POWER-based processors other than the PowerPC 601 RISC Microprocessor). The *t* argument is a pointer to a *timebasestruct_t*, where the time values are recorded.

After calling **read_real_time**, if running on a processor with a real time clock, *t->tb_high* and *t->tb_low* contain the current clock values (seconds and nanoseconds), and *t->flag* contains the **RTC_POWER**.

If running on a processor with a time base register, *t->tb_high* and *t-tb_low* contain the current values of the time base register, and *t->flag* contains **RTC POWER PC**.

The **time_base_to_time** subroutine converts time base information to real time, if necessary. It is recommended that applications unconditionally call the **time_base_to_time** subroutine rather than performing a check to see if it is necessary.

If *t->flag* is **RTC_POWER**, the subroutine simply returns (the data is already in real time format).

If *t->flag* is **RTC_POWER_PC**, the time base information in *t->tb_high* and *t->tb_low* is converted to seconds and nanoseconds; *t->tb_high* is replaced by the seconds; *t->tb_low* is replaced by the nanoseconds; and *t->flag* is changed to **RTC POWER**.

Parameters

t Points to a timebasestruct_t.

Return Values

The **read_real_time** subroutine returns **RTC_POWER** if the contents of the real time clock has been recorded in the *timebasestruct*, or returns **RTC_POWER_PC** if the content of the time base registers has been recorded in the *timebasestruct*.

The read wall time subroutine always returns RTC POWER PC.

The **time_base_to_time** subroutine returns **0** if the conversion to real time is successful (or not necessary), otherwise **-1** is returned.

Examples

This example shows the time it takes for **print_f** to print the comment between the begin and end time codes:

```
#include <stdio.h>
#include <sys/time.h>
int
```

```
main(void)
   timebasestruct t start, finish;
   int val = 3;
  int secs, n_secs;
   /* get the time before the operation begins */
   read real time(&start, TIMEBASE SZ);
   /* begin code to be timed */
   (void) printf("This is a sample line %d \n", val);
   /* end code to be timed
                            */
   /* get the time after the operation is complete */
   read_real_time(&finish, TIMEBASE_SZ);
   \star Call the conversion routines unconditionally, to ensure
   * that both values are in seconds and nanoseconds regardless
   * of the hardware platform.
   time base to time(&start, TIMEBASE SZ);
   time_base_to_time(&finish, TIMEBASE_SZ);
   /* subtract the starting time from the ending time */
   secs = finish.tb_high - start.tb_high;
  n_secs = finish.tb_low - start.tb_low;
  * If there was a carry from low-order to high-order during
   * the measurement, we may have to undo it.
   if (n secs < 0) {
     secs--;
     n secs += 1000000000;
   (void) printf("Sample time was %d seconds %d nanoseconds\n",
                secs, n secs);
   exit(0);
```

High-Resolution Time Measurements Using POWER-based Time Base or POWER family Real-Time Clock in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

realpath Subroutine

Purpose

Resolves path names.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h>

char *realpath (const char *file name, char *resolved name)

Description

The realpath subroutine performs filename expansion and path name resolution in file_name and stores it in resolved name.

The realpath subroutine can handle both relative and absolute path names. For both absolute and relative path names, the realpath subroutine returns the resolved absolute path name.

The character pointed to by resolved name must be big enough to contain the fully resolved path name. The value of PATH_MAX (defined in limits.h header file may be used as an appropriate array size.

Return Values

On successful completion, the realpath subroutine returns a pointer to the resolved name. Otherwise, it returns a null pointer, and sets errno to indicate the error. If the realpath subroutine encounters an error, the contents of resolved name are undefined.

Error Codes

Under the following conditions, the realpath subroutine fails and sets errno to:

EACCES Read or search permission was denied for a component of the

path name.

EINVAL File_name or resolved_name is a null pointer.

ELOOP Too many symbolic links are encountered in translating *file name*. **ENAMETOOLONG**

The length of file name or resolved name exceeds PATH MAX or

a path name component is longer than NAME_MAX.

ENOENT The file_name parameter does not exist or points to an empty

ENOTDIR A component of the *file_name* prefix is not a directory.

The realpath subroutine may fail if:

ENOMEM Insufficient storage space is available.

Related Information

The **getcwd** or **sysconf** ("sysconf Subroutine" on page 366) subroutine.

reboot Subroutine

Purpose

Restarts the system.

Library

Standard C Library (libc.a)

Syntax

#include <sys/reboot.h>

```
void reboot ( HowTo, Argument)
int HowTo;
void *Argument;
```

Description

The **reboot** subroutine restarts or re-initial program loads (IPL) the system. The startup is automatic and brings up **/unix** in the normal, nonmaintenance mode.

Note: The routine may coredump instead of returning EFAULT when an invalid pointer is passed in case of 64-bit application calling 32-bit kernel interface.

The calling process must have root user authority in order to run this subroutine successfully.

Attention: Users of the **reboot** subroutine are not portable. The **reboot** subroutine is intended for use only by the **halt**, **reboot**, and **shutdown** commands.

Parameters

HowTo Specifies one of the following values:

RB_SOFTIPL

Soft IPL.

RB_HALT

Halt operator; turn the power off.

RB POWIPL

Halt operator; turn the power off. Wait a specified length of time, and then turn the power on.

Argument

Specifies the amount of time (in seconds) to wait between turning the power off and turning the power on. This option is not supported on all models. Please consult your hardware technical reference for more details.

Return Values

Upon successful completion, the **reboot** subroutine does not return a value. If the **reboot** subroutine fails, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **reboot** subroutine is unsuccessful if any of the following is true:

EPERM The calling process does not have root user authority.

EINVAL The *HowTo* value is not valid.

EFAULT The *Argument* value is not a valid address.

Related Information

The halt command, reboot command, shutdown command.

re_comp or re_exec Subroutine

Purpose

Regular expression handler.

Library

Standard C Library (libc.a)

Syntax

```
char *re comp( String)
const char *String;
int re exec(String)
const char *String;
```

Description

Attention: Do not use the re_comp or re_exec subroutine in a multithreaded environment.

The re_comp subroutine compiles a string into an internal form suitable for pattern matching. The re_exec subroutine checks the argument string against the last string passed to the **re comp** subroutine.

The **re comp** subroutine returns 0 if the string pointed to by the *String* parameter was compiled successfully; otherwise a string containing an error message is returned. If the re comp subroutine is passed 0 or a null string, it returns without changing the currently compiled regular expression.

The **re exec** subroutine returns 1 if the string pointed to by the *String* parameter matches the last compiled regular expression, 0 if the string pointed to by the String parameter failed to match the last compiled regular expression, and -1 if the compiled regular expression was invalid (indicating an internal error).

The strings passed to both re comp and re exec subroutines may have trailing or embedded newline characters; they are terminated by nulls. The regular expressions recognized are described in the manual entry for the **ed** command, given the above difference.

Parameters

String Points to a string that is to be matched or compiled.

Return Values

If an error occurs, the re exec subroutine returns a -1, while the re comp subroutine returns one of the following strings:

- No previous regular expression
- Regular expression too long
- unmatched \(
- · missing]
- too many \(\) pairs
- unmatched \)

regcmp or regex Subroutine

Purpose

Compiles and matches regular-expression patterns.

Libraries

Standard C Library (libc.a)

Programmers Workbench Library (libPW.a)

Syntax

```
#include <libgen.h>
char *regcmp ( String [, String, . . . ], (char *) 0)
const char *String, . . .;

const char *regex ( Pattern, Subject [, ret, . . . ])
char *Pattern, *Subject, *ret, . . .;
extern char *_loc1;
```

Description

Note: The **regcmp** and **regex** subroutines are provided for compatibility with existing applications only. For portable applications, use the **regcomp** and **regexec** subroutines instead.

The **regcmp** subroutine compiles a regular expression (or *Pattern*) and returns a pointer to the compiled form. The **regcmp** subroutine allows multiple *String* parameters. If more than one *String* parameter is given, then the **regcmp** subroutine treats them as if they were concatenated together. It returns a null pointer if it encounters an incorrect parameter.

You can use the **regcmp** command to compile regular expressions into your C program, frequently eliminating the need to call the **regcmp** subroutine at run time.

The **regex** subroutine compares a compiled *Pattern* to the *Subject* string. Additional parameters are used to receive values. Upon successful completion, the **regex** subroutine returns a pointer to the next unmatched character. If the **regex** subroutine fails, a null pointer is returned. A global character pointer, __loc1, points to where the match began.

The **regcmp** and **regex** subroutines are borrowed from the **ed** command; however, the syntax and semantics have been changed slightly. You can use the following symbols with the **regcmp** and **regex** subroutines:

[]*.^ These symbols have the same meaning as they do in the **ed** command.

The minus sign (or hyphen) within brackets used with the **regex** subroutine means "through," according to the current collating sequence. For example, [a-z] can be equivalent to [abcd . . . xyz] or [aBbCc . . . xYyZz]. You can use the - by itself if the - is the last or first character. For example, the character class expression [] -] matches the] (right bracket) and - (minus) characters.

The **regcmp** subroutine does not use the current collating sequence, and the minus sign in brackets controls only a direct ASCII sequence. For example, [a-z] always means [abc . . . xyz] and [A-Z] always means [ABC . . . XYZ] . If you need to control the specific characters in a range using the **regcmp** subroutine, you must list them explicitly rather than using the minus sign in the character class expression.

Matches the end of the string. Use the \n character to match a new-line character.

A regular expression followed by + (plus sign) means one or more times. For example, [0-9] + is equivalent to [0-9] [0-9] *.

Integer values enclosed in $\{\}$ (braces) indicate the number of times to apply the preceding regular expression. The m character is the minimum number and the u character is the maximum number. The u character must be less than 256. If you specify only m, it indicates the exact number of times to apply the regular expression. $\{m,\}$ is equivalent to $\{m,u\}$ and matches m or more occurrences of the expression. The + (plus sign) and * (asterisk) operations are equivalent to $\{1,\}$ and $\{0,\}$, respectively.

This stores the value matched by the enclosed regular expression in the (n+1)th ret parameter. Ten enclosed regular expressions are allowed. The regex subroutine makes the assignments unconditionally.

Parentheses group subexpressions. An operator, such as *, +, or [] works on a single character or on a regular expression enclosed in parentheses. For example, $(a^*(cb+)^*)$ \$0.

All of the preceding defined symbols are special. You must precede them with a \ (backslash) if you want to match the special symbol itself. For example, \\$ matches a dollar sign.

Note: The **regcmp** subroutine uses the **malloc** subroutine to make the space for the vector. Always free the vectors that are not required. If you do not free the unneeded vectors, you can run out of memory if the **regcmp** subroutine is called repeatedly. Use the following as a replacement for the **malloc** subroutine to reuse the same vector, thus saving time and space:

```
/* . . . Your Program . . . */
malloc(n)
   int n;
{
   static int rebuf[256] ;
   return ((n <= sizeof(rebuf)) ? rebuf : NULL);
}</pre>
```

The **regcmp** subroutine produces code values that the **regex** subroutine can interpret as the regular expression. For instance, [a-z] indicates a range expression which the **regcmp** subroutine compiles into a string containing the two end points (a and z).

The **regex** subroutine interprets the range statement according to the current collating sequence. The expression [a-z] can be equivalent either to [abcd . . . xyz], or to [aBbCcDd . . . xXyYzZ], as long as the character *preceding* the minus sign has a lower collating value than the character *following* the minus sign.

The behavior of a range expression is dependent on the collation sequence. If you want to match a *specific* set of characters, you should list each one. For example, to select letters a, b, or c, use [abc] rather than [a-c] .

\$

 $\{ m\} \{m,\} \{m, u\}$

(...)\$n

(. . .)

Notes:

- 1. No assumptions are made at compile time about the actual characters contained in the range.
- 2. Do not use multibyte characters.
- 3. You can use the] (right bracket) itself within a pair of brackets if it immediately follows the leading [(left bracket) or [^ (a left bracket followed immediately by a circumflex).
- 4. You can also use the minus sign (or hyphen) if it is the first or last character in the expression. For example, the expression [] -0] matches either the right bracket (]), or the characters through 0.

Parameters

Subject Specifies a comparison string.

String Specifies the Pattern to be compiled.

Pattern Specifies the expression to be compared.

ret Points to an address at which to store comparison data. The regex subroutine allows multiple ret

String parameters.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

regcomp Subroutine

Purpose

Compiles a specified basic or extended regular expression into an executable string.

Library

Standard C Library (libc. a)

Syntax

```
#include <regex.h>
int regcomp ( Preg, Pattern, CFlags)
const char *Preg;
const char *Pattern;
int CFlags;
```

Description

The **regcomp** subroutine compiles the basic or extended regular expression specified by the *Pattern* parameter and places the output in the structure pointed to by the *Preg* parameter.

Parameters

Preg Specifies the structure to receive the compiled output of the **regcomp** subroutine.

Pattern Contains the basic or extended regular expression to be compiled by the **regcomp** subroutine.

The default regular expression type for the *Pattern* parameter is a basic regular expression. An application can specify extended regular expressions with the **REG_EXTENDED** flag. The maximum number of subexpressions in an extended regular expression is 23.

CFlags

Contains the bitwise inclusive OR of 0 or more flags for the **regcomp** subroutine. These flags are defined in the **regex.h** file:

REG_EXTENDED

Uses extended regular expressions. The maximum number of subexpressions in an extended regular expression is 23.

REG ICASE

Ignores case in match.

REG_NOSUB

Reports only success or failure in the **regexec** subroutine. If this flag is not set, the **regcomp** subroutine sets the **re_nsub** structure to the number of parenthetic expressions found in the *Pattern* parameter.

REG_NEWLINE

Prohibits . (period) and nonmatching bracket expression from matching a new-line character. The ^ (circumflex) and \$ (dollar sign) will match the zero-length string immediately following or preceding a new-line character.

Return Values

If successful, the **regcomp** subroutine returns a value of 0. Otherwise, it returns another value indicating the type of failure, and the content of the *Preg* parameter is undefined.

Error Codes

The following macro names for error codes may be written to the **errno** global variable under error conditions:

REG_BADPAT Indicates a basic or extended regular expression that is not valid. **REG ECOLLATE** Indicates a collating element referenced that is not valid.

REG_ECTYPE Indicates a character class-type reference that is not valid.

REG_EESCAPE Indicates a trailing \ in pattern.

REG_ESUBREG Indicates a number in \digit is not valid or in error.

REG_EBRACK Indicates a [] imbalance.

REG_EPAREN Indicates a \(\) or () imbalance.

REG_EBRACE Indicates a \{\} imbalance.

REG_BADBR Indicates the content of \{\} is unusable: not a number, number too large, more than two

numbers, or first number larger than second.

REG_ERANGE Indicates an unusable end point in range expression.

REG_ESPACE Indicates out of memory.

REG_BADRPT Indicates a ? (question mark), * (asterisk), or + (plus sign) not preceded by valid basic or

extended regular expression.

If the **regcomp** subroutine detects an illegal basic or extended regular expression, it can return either the **REG_BADPAT** error code or another that more precisely describes the error.

Examples

The following example illustrates how to match a string (specified in the *string* parameter) against an extended regular expression (specified in the *Pattern* parameter):

```
#include <sys/types.h>
#include <regex.h>
int
```

In the preceding example, errors are treated as no match. When there is no match or error, the calling process can get details by calling the **regerror** subroutine.

Related Information

The **regerror** ("regerror Subroutine") subroutine, **regexec** ("regexec Subroutine" on page 51) subroutine, **regfree** ("regfree Subroutine" on page 53) subroutine.

Subroutines Overview and Understanding Internationalized Regular Expression Subroutinesi in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

regerror Subroutine

Purpose

Returns a string that describes the ErrCode parameter.

Library

Standard C Library (libc. a)

Syntax

```
#include <regex.h>
size_t regerror (ErrCode, Preg, ErrBuf, ErrBuf_Size)
int ErrCode;
const regex_t * Preg;
char * ErrBuf;
size_t ErrBuf_Size;
```

Description

The **regerror** subroutine provides a mapping from error codes returned by the **regcomp** and **regexec** subroutines to printable strings. It generates a string corresponding to the value of the *ErrCode* parameter, which is the last nonzero value returned by the **regcomp** or **regexec** subroutine with the given value of the *Preg* parameter. If the *ErrCode* parameter is not such a value, the content of the generated string is unspecified. The string generated is obtained from the **regex.cat** message catalog.

If the *ErrBuf_Size* parameter is not 0, the **regerror** subroutine places the generated string into the buffer specifier by the *ErrBuf* parameter, whose size in bytes is specified by the *ErrBuf_Size* parameter. If the string (including the terminating null character) cannot fit in the buffer, the **regerror** subroutine truncates the string and null terminates the result.

Parameters

ErrCode Specifies the error for which a description string is to be returned.

Preg Specifies the structure that holds the previously compiled output of the regcomp subroutine.

ErrBuf Specifies the buffer to receive the string generated by the **regerror** subroutine.

ErrBuf Size Specifies the size of the *ErrBuf* parameter.

Return Values

The **regerror** subroutine returns the size of the buffer needed to hold the entire generated string, including the null termination. If the return value is greater than the value of the ErrBuf Size variable, the string returned in the *ErrBuf* buffer is truncated.

Error Codes

If the ErrBuf Size value is 0, the regerror subroutine ignores the ErrBuf parameter, but returns the one of the following error codes. These error codes defined in the regex.h file.

REG_NOMATCH Indicates the basic or extended regular expression was unable to find a match.

REG_BADPAT Indicates a basic or extended regular expression that is not valid.

REG ECOLLATE Indicates a collating element referenced that is not valid. **REG ECTYPE** Indicates a character class-type reference that is not valid.

REG EESCAPE Indicates a trailing \ in pattern.

REG_ESUBREG Indicates a number in \digit is not valid or in error.

REG_EBRACK Indicates a [] imbalance.

REG_EPAREN Indicates a \(\) or () imbalance. **REG EBRACE** Indicates a \{\} imbalance.

REG BADBR Indicates the content of \{\} is unusable: not a number, number too large, more than two

numbers, or first number larger than second.

REG_ERANGE Indicates an unusable end point in range expression.

REG ESPACE Indicates out of memory.

REG_BADRPT Indicates a ? (question mark), * (asterisk), or + (plus sign) not preceded by valid basic or

extended regular expression.

REG_ENEWLINE Indicates a new-line character was found before the end of the regular or extended regular

expression, and REG NEWLINE was not set.

If the Preg parameter passed to the regexec subroutine is not a compiled basic or extended regular expression returned by the **regcomp** subroutine, the result is undefined.

Examples

An application can use the **regerror** subroutine (with the parameters (Code, Preg, null, (size t) 0) passed to it) to determine the size of buffer needed for the generated string, call the malloc subroutine to allocate a buffer to hold the string, and then call the **regerror** subroutine again to get the string. Alternately, this subroutine can allocate a fixed, static buffer that is large enough to hold most strings (perhaps 128 bytes), and then call the malloc subroutine to allocate a larger buffer if necessary.

Related Information

The **regcomp** ("regcomp Subroutine" on page 47) subroutine, **regexec** ("regexec Subroutine" on page 51) subroutine, regfree ("regfree Subroutine" on page 53) subroutine.

Subroutines Overview and Understanding Internationalized Regular Expression Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

regexec Subroutine

Purpose

Compares the null-terminated string specified by the value of the *String* parameter against the compiled basic or extended regular expression *Preg*, which must have previously been compiled by a call to the **regcomp** subroutine.

Library

Standard C Library (libc. a)

Syntax

```
#include <regex.h>
int regexec (Preg, String, NMatch, PMatch, EFlags)
const regex_t * Preg;
const char * String;
size_t NMatch;
regmatch_t * PMatch;
int EFlags;
```

Description

The **regexec** subroutine compares the null-terminated string in the *String* parameter with the compiled basic or extended regular expression in the *Preg* parameter initialized by a previous call to the **regcomp** subroutine. If a match is found, the **regexec** subroutine returns a value of 0. The **regexec** subroutine returns a nonzero value if it finds no match or it finds an error.

If the *NMatch* parameter has a value of 0, or if the **REG_NOSUB** flag was set on the call to the **regcomp** subroutine, the **regexec** subroutine ignores the *PMatch* parameter. Otherwise, the *PMatch* parameter points to an array of at least the number of elements specified by the *NMatch* parameter. The **regexec** subroutine fills in the elements of the array pointed to by the *PMatch* parameter with offsets of the substrings of the *String* parameter. The offsets correspond to the parenthetic subexpressions of the original *pattern* parameter that was specified to the **regcomp** subroutine.

The **pmatch.rm_so** structure is the byte offset of the beginning of the substring, and the **pmatch.rm_eo** structure is one greater than the byte offset of the end of the substring. Subexpression *i* begins at the *i* th matched open parenthesis, counting from 1. The 0 element of the array corresponds to the entire pattern. Unused elements of the *PMatch* parameter, up to the value *PMatch*[*NMatch-*1], are filled with -1. If more than the number of subexpressions specified by the *NMatch* parameter (the *pattern* parameter itself counts as a subexpression), only the first *NMatch-*1 subexpressions are recorded.

When a basic or extended regular expression is being matched, any given parenthetic subexpression of the *pattern* parameter might match several different substrings of the *String* parameter. Otherwise, it might not match any substring even though the pattern as a whole did match.

The following rules are used to determine which substrings to report in the *PMatch* parameter when regular expressions are matched:

- If a subexpression in a regular expression participated in the match several times, the offset of the last matching substring is reported in the *PMatch* parameter.
- If a subexpression did not participate in a match, the byte offset in the *PMatch* parameter is a value of -1. A subexpression does not participate in a match if any of the following are true:
 - An * (asterisk) or \{\} (backslash, left brace, backslash, right brace) appears immediately after the subexpression in a basic regular expression.

- An * (asterisk), ? (question mark), or { } (left and right braces) appears immediately after the subexpression in an extended regular expression and the subexpression did not match (matched 0 times).
- A | (pipe) is used in an extended regular expression to select either the subexpression that didn't match or another subexpression, and the other subexpression matched.
- If a subexpression is contained in a subexpression, the data in the PMatch parameter refers to the last such subexpression.
- If a subexpression is contained in a subexpression and the byte offsets in the PMatch parameter have a value of -1, the pointers in the *PMatch* parameter also have a value of -1.
- If a subexpression matched a zero-length string, the offsets in the *PMatch* parameter refer to the byte immediately following the matching string.

If the REG_NOSUB flag was set in the cflags parameter in the call to the regcomp subroutine, and the NMatch parameter is not equal to 0 in the call to the **regexec** subroutine, the content of the PMatch array is unspecified.

If the **REG NEWLINE** flag was not set in the *cflags* parameter when the **regcomp** subroutine was called, then a new-line character in the pattern or String parameter is treated as an ordinary character. If the REG_NEWLINE flag was set when the regcomp subroutine was called, the new-line character is treated as an ordinary character except as follows:

- A new-line character in the String parameter is not matched by a period outside of a bracket expression or by any form of a nonmatching list. A nonmatching list expression begins with a \(^\) (circumflex) and specifies a list that matches any character or collating element and the expression in the list after the leading caret. For example, the regular expression [^abc] matches any character except a, b, or c. The circumflex has this special meaning only when it is the first character in the list, immediately following the left bracket.
- A \(\text{ (circumflex) in the pattern parameter, when used to specify expression anchoring, matches the zero-length string immediately after a new-line character in the String parameter, regardless of the setting of the REG_NOTBOL flag.
- · A \$ (dollar sign) in the pattern parameter, when used to specify expression anchoring, matches the zero-length string immediately before a new-line character in the String parameter, regardless of the setting of the REG_NOTEOL flag.

Parameters

Preg Contains the compiled basic or extended regular expression to compare against the String parameter.

String Contains the data to be matched.

NMatch Contains the number of subexpressions to match.

PMatch Contains the array of offsets into the String parameter that match the corresponding subexpression in the Preg parameter.

Contains the bitwise inclusive OR of 0 or more of the flags controlling the behavior of the regexec **EFlags** subroutine capable of customizing.

> The EFlags parameter modifies the interpretation of the contents of the String parameter. It is the bitwise inclusive OR of 0 or more of the following flags, which are defined in the regex.h file:

REG_NOTBOL

The first character of the string pointed to by the String parameter is not the beginning of the line. Therefore, the ^ (circumflex), when used as a special character, does not match the beginning of the String parameter.

REG_NOTEOL

The last character of the string pointed to by the String parameter is not the end of the line. Therefore, the \$ (dollar sign), when used as a special character, does not match the end of the String parameter.

Return Values

On successful completion, the **regexec** subroutine returns a value of 0 to indicate that the contents of the *String* parameter matched the contents of the *pattern* parameter, or to indicate that no match occurred. The **REG_NOMATCH** error is defined in the **regex.h** file.

Error Codes

If the **regexec** subroutine is unsuccessful, it returns a nonzero value indicating the type of problem. The following macros for possible error codes that can be returned are defined in the **regex.h** file:

REG NOMATCH Indicates the basic or extended regular expression was unable to find a match. REG_BADPAT Indicates a basic or extended regular expression that is not valid. REG_ECOLLATE Indicates a collating element referenced that is not valid. **REG ECTYPE** Indicates a character class-type reference that is not valid. REG EESCAPE Indicates a trailing \ (backslash) in the pattern. REG ESUBREG Indicates a number in \digit is not valid or is in error. REG_EBRACK Indicates a [] (left and right brackets) imbalance. REG_EPAREN Indicates a \ (\) (backslash, left parenthesis, backslash, right parenthesis) or () (left and right parentheses) imbalance. REG_EBRACE Indicates a \ { \ } (backslash, left brace, backslash, right brace) imbalance. **REG BADBR** Indicates the content of \ \ \ \ (backslash, left brace, backslash, right brace) is unusable (not a number, number too large, more than two numbers, or first number larger than second). **REG ERANGE** Indicates an unusable end point in range expression. REG_ESPACE Indicates out of memory. **REG BADRPT** Indicates a ? (question mark), * (asterisk), or + (plus sign) not preceded by valid basic or extended regular expression.

If the value of the *Preg* parameter to the **regexec** subroutine is not a compiled basic or extended regular expression returned by the **regcomp** subroutine, the result is undefined.

Examples

The following example demonstrates how the **REG_NOTBOL** flag can be used with the **regexec** subroutine to find all substrings in a line that match a pattern supplied by a user. (For simplicity, very little error-checking is done in this example.)

```
(void) regcomp (&re, pattern, 0);
/* this call to regexec finds the first match on the line */
error = regexec (&re, &buffer[0], 1, &pm, 0);
while (error = = 0) {    /* while matches found */
<subString found between pm.r._sp and pm.rm_ep>
/* This call to regexec finds the next match */
error = regexec (&re, pm.rm_ep, 1, &pm, REG_NOTBOL);
```

Subroutines Overview and Understanding Internationalized Regular Expression Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

regfree Subroutine

Purpose

Frees any memory allocated by the **regcomp** subroutine associated with the *Preg* parameter.

Library

Standard C Library (libc. a)

Syntax

```
#include <regex.h>
void regfree ( Preg)
regex_t *Preg;
```

Description

The **regfree** subroutine frees any memory allocated by the **regcomp** subroutine associated with the *Preg* parameter. An expression defined by the *Preg* parameter is no longer treated as a compiled basic or extended regular expression after it is given to the **regfree** subroutine.

Parameters

Prea

Structure containing the compiled output of the **regcomp** subroutine. Memory associated with this structure is freed by the **regfree** subroutine.

Related Information

The **regcomp** ("regcomp Subroutine" on page 47) subroutine, **regerror** ("regerror Subroutine" on page 49) subroutine, **regexec** ("regexec Subroutine" on page 51) subroutine.

Subroutines Overview and Understanding Internationalized Regular Expression Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

reltimerid Subroutine

Purpose

Releases a previously allocated interval timer.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/time.h>
#include <sys/events.h>
int reltimerid ( TimerID)
timer_t TimerID;
```

Description

The **reltimerid** subroutine is used to release a previously allocated interval timer, which is returned by the **gettimerid** subroutine. Any pending timer event generated by this interval timer is cancelled when the call returns.

Parameters

TimerID Specifies the ID of the interval timer being released.

Return Values

The **reltimerid** subroutine returns a 0 if it is successful. If an error occurs, the value -1 is returned and **errno** is set.

Error Codes

If the reltimerid subroutine fails, a -1 is returned and errno is set with the following error code:

EINVAL The timer ID specified by the *Timerid* parameter is not a valid timer ID.

Related Information

The gettimerid subroutine.

List of time data manipulation services in Operating system and device management.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

remainder, remainderf, remainderl, remainderd32, remainderd64, and remainderd128 Subroutines

Purpose

Returns the floating-point remainder.

Syntax

```
#include <math.h>
double remainder (x, y)
double x;
double y;
float remainderf (x, y)
float x;
float y;
long double remainder (x, y)
long double x;
long double y;
Decimal 32 remainder d 32 (x, y)
Decimal32 x;
Decima132 y;
_Decimal64 remainderd64 (x, y)
_Decimal64 x;
Decimal64 y;
Decimal 128 remainder d128 (x, y)
Decimal 128 x;
Decimal 128 y;
```

Description

The **remainder**, **remainder**, **remainder**, **remainder**d32, **remainder**d64, and **remainder**d128 subroutines return the floating-point remainder r=x - ny when y is nonzero. The value n is the integral value nearest the exact value x/y. When $|n x/y| = \frac{1}{2}$, the value n is chosen to be even.

Parameters

Specifies the value of the numerator. X

Specifies the value of the denominator. V

Return Values

Upon successful completion, the remainder, remainderf, remainderl, remainderd32, remainderd64, and **remainderd128** subroutines return the floating-point remainder r=x - ny when y is nonzero.

If x or y is NaN, a NaN is returned.

If x is infinite or y is 0 and the other is non-NaN, a domain error occurs, and a NaN is returned.

Related Information

remove Subroutine

Purpose

Removes a file.

Library

Standard C Library (libc.a)

Syntax

#include <stdio.h>

int remove(FileName) const char *FileName;

Description

The remove subroutine makes a file named by FileName inaccessible by that name. An attempt to open that file using that name does not work unless you recreate it. If the file is open, the subroutine does not remove it.

If the file designated by the FileName parameter has multiple links, the link count of files linked to the removed file is reduced by 1.

Parameters

Specifies the name of the file being removed. **FileName**

Return Values

Upon successful completion, the remove subroutine returns a value of 0; otherwise it returns a nonzero value.

Related Information

The link subroutine, rename ("rename Subroutine" on page 59) subroutine.

The **link** or **unlink** ("unlink Subroutine" on page 495) command.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

removeea Subroutine

Purpose

Removes an extended attribute.

Syntax

```
#include <sys/ea.h>
int removeea(const char *path, const char *name);
int fremoveea(int filedes, const char *name);
int lremoveea(const char *path, const char *name);
```

Description

Extended attributes are name:value pairs associated with the file system objects (such as files, directories, and symlinks). They are extensions to the normal attributes that are associated with all objects in the file system (that is, the **stat(2)** data).

Do not define an extended attribute name with the 8-character prefix "(0xF8)SYSTEM(0xF8)". Prefix "(0xF8)SYSTEM(0xF8)" is reserved for system use only.

Note: 0xF8 represents a non-printable character.

The **removeea** subroutine removes the extended attribute identified by *name* and associated with the given *path* in the file system. The **fremoveea** subroutine is identical to **removeea**, except that it takes a file descriptor instead of a path. The **Iremoveea** subroutine is identical to **removeea**, except, in the case of a symbolic link, the link itself is interrogated rather than the file that it refers to.

Parameters

path The path name of the file.

name The name of the extended attribute. An extended attribute name is a NULL-terminated string.

filedes A file descriptor for the file.

Return Values

If the **removeea** subroutine succeeds, 0 is returned. Upon failure, -1 is returned and **errno** is set appropriately.

Error Codes

EACCES Caller lacks write permission on the base file, or lacks the appropriate ACL privileges for

named attribute delete.

EFAULT A bad address was passed for *path* or *name*.

EFORMATFile system is capable of supporting EAs, but EAs are disabled.

A path-like name should not be used (such as **zml/file**, . and ..).

The named attribute does not exist, or tthe process has no access to this attribute. Extended attributes are not supported by the file system.

Related Information

The getea Subroutine, listea Subroutine, "setea Subroutine" on page 174, and "statea Subroutine" on page 324

remquo, remquof, remquol remquod32, remquod64, and remquod128 **Subroutines**

Purpose

Returns the floating-point remainder.

Syntax

```
#include <math.h>
double remquo (x, y, quo)
double x;
double v;
int *quo;
float remquof (x, y, quo)
float x;
float y;
int *quo;
long double remquol (x, y, quo)
long double x;
long double y;
int *quo;
Decimal 32 remquod 32 (x, y, quo)
Decima132 x;
Decimal32 y;
int *quo;
_Decimal64 remquod64 (x, y, quo)
Decimal64 x;
Decimal64 y;
int *quo;
Decimal 128 remquod 128 (x, y, quo)
Decimal 128 x;
_
Decimal128 y;
int *quo;
```

Description

The remand, remand, remand, remand32, remand64, remand128 subroutines compute the same remainder as the remainder, remainderf, remainderl remainderd32, remainderd64, and remainder128 functions, respectively. In the object pointed to by quo, they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo 2^n to the magnitude of the integral quotient of x/y, where n is 3.

An application wishing to check for error situations should set the errno global variable to zero and call feclearexcept(FE ALL EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

x Specifies the value of the numerator.y Specifies the value of the denominator.

quo Points to the object where a value whose sign is the sign of x/y is stored.

Return Values

The **remquo**, **remquol**, **remquod32**, **remquod64**, and **remquod128** subroutines return *x* REM *y*.

If x or y is NaN, a NaN is returned.

If x is ±Inf or y is zero and the other argument is non-NaN, a domain error occurs, and a NaN is returned.

Related Information

"remainder, remainderf, remainderl, remainderd32, remainderd64, and remainderd128 Subroutines" on page 55

feclearexcept Subroutine, fetestexcept Subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

math.h in AIX 5L Version 5.3 Files Reference.

rename Subroutine

Purpose

Renames a directory or a file.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdio.h>
int rename ( FromPath, ToPath)
const char *FromPath, *ToPath;
```

Description

The **rename** subroutine renames a directory or a file within a file system.

To use the **rename** subroutine, the calling process must have write and search permission in the parent directories of both the *FromPath* and *ToPath* parameters. If the path defined in the *FromPath* parameter is a directory, the calling process must have write and search permission to the *FromPath* directory as well.

If the *FromPath* and *ToPath* parameters both refer to the same existing file, the **rename** subroutine returns successfully and performs no other action.

The components of both the *FromPath* and *ToPath* parameters must be of the same type (that is, both directories or both non-directories) and must reside on the same file system. If the *ToPath* file already

exists, it is first removed. Removing it guarantees that a link named ToPath will exist throughout the operation. This link refers to the file named by either the ToPath or FromPath parameter before the operation began.

If the final component of the FromPath parameter is a symbolic link, the symbolic link (not the file or directory to which it points) is renamed. If the *ToPath* is a symbolic link, the link is destroyed.

If the parent directory of the FromPath parameter has the Sticky bit attribute (described in the sys/mode.h file), the calling process must have an effective user ID equal to the owner ID of the FromPath parameter, or to the owner ID of the parent directory of the *FromPath* parameter.

A user who is not the owner of the file or directory must have root user authority to use the rename subroutine.

If the FromPath and ToPath parameters name directories, the following must be true:

- The directory specified by the FromPath parameter is not an ancestor of ToPath. For example, the FromPath path name must not contain a path prefix that names the directory specified by the ToPath parameter.
- The directory specified in the FromPath parameter must be well-formed. A well-formed directory contains both . (dot) and .. (dot dot) entries. That is, the . (dot) entry in the FromPath directory refers to the same directory as that in the FromPath parameter. The .. (dot dot) entry in the FromPath directory refers to the directory that contains an entry for FromPath.
- · The directory specified by the ToPath parameter, if it exists, must be well-formed (as defined previously).

Parameters

FromPath Identifies the file or directory to be renamed.

ToPath Identifies the new path name of the file or directory to be renamed. If ToPath is an existing file or

empty directory, it is replaced by FromPath. If ToPath specifies a directory that is not empty, the

rename subroutine exits with an error.

Return Values

Upon successful completion, the rename subroutine returns a value of 0. Otherwise, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The rename subroutine is unsuccessful and the file or directory name remains unchanged if one or more of the following are true:

EACCES Creating the requested link requires writing in a directory mode that denies the

process write permission.

EBUSY The directory named by the FromPath or ToPath parameter is currently in use by the

system, or the file named by FromPath or ToPath is a named STREAM.

EDQUOT The directory that would contain the path specified by the ToPath parameter cannot

be extended because the user's or group's quota of disk blocks on the file system

containing the directory is exhausted.

EEXIST The ToPath parameter specifies an existing directory that is not empty.

EINVAL The path specified in the FromPath or ToPath parameter is not a well-formed

directory (FromPath is an ancestor of ToPath), or an attempt has been made to

rename . (dot) or .. (dot dot).

EISDIR The ToPath parameter names a directory and the FromPath parameter names a

non-directory.

EMLINK The *FromPath* parameter names a directory that is larger than the maximum link

count of the parent directory of the ToPath parameter.

ENOENT A component of either path does not exist, the file named by the *FromPath*

parameter does not exist, or a symbolic link was named, but the file to which it

refers does not exist.

ENOSPC The directory that would contain the path specified in the *ToPath* parameter cannot

be extended because the file system is out of space.

ENOTDIR The *FromPath* parameter names a directory and the *ToPath* parameter names a

non-directory.

ENOTEMPTY The *ToPath* parameter specifies an existing directory that is not empty.

ETXTBSY

The requested operation requires writing in a directory on a read-only file system.

The ToPath parameter names a shared text file that is currently being used.

EXDEV

The link named by the ToPath parameter and the file named by the FromPath

parameter are on different file systems.

If Network File System (NFS) is installed on the system, the **rename** subroutine can be unsuccessful if the following is true:

ETIMEDOUT The connection timed out.

The **rename** subroutine can be unsuccessful for other reasons. See Appendix A, "Base Operating System Error Codes For Services That Require Path-Name Resolution" for a list of additional errors.

reset_malloc_log Subroutine

Purpose

Resets information collected by the malloc subsystem.

Syntax

#include <malloc.h>
void reset_malloc_log (addr)
void *addr;

Description

The **reset_malloc_log** subroutine resets the record of currently active malloc allocations stored by the malloc subsystem. These records are stored in **malloc_log** structures, which are located in the process heap. Only records corresponding to the heap of which *addr* is a member are reset, unless *addr* is NULL, in which case records for all heaps are reset. The *addr* parameter must be a pointer to space allocated previously by the malloc subsystem or NULL, otherwise no information is reset and the **errno** global variable is set to **EINVAL**.

Parameters

addr

Pointer to space allocated previously by the malloc subsystem

Related Information

malloc Subroutine, get_malloc_log Subroutine, and get_malloc_log_live Subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1

revoke Subroutine

Purpose

Revokes access to a file.

Library

Standard C Library (libc.a)

Syntax

int revoke (Path) char *Path;

Description

The **revoke** subroutine revokes access to a file by all processes.

All accesses to the file are revoked. Subsequent attempts to access the file using a file descriptor established before the revoke subroutine fail and cause the process to receive a return value of -1, and the errno global variable is set to EBADF.

A process can revoke access to a file only if its effective user ID is the same as the file owner ID, or if the calling process is privileged.

Note: The revoke subroutine has no affect on subsequent attempts to open the file. To assure exclusive access to the file, the caller should change the access mode of the file before issuing the revoke subroutine. Currently the revoke subroutine works only on terminal devices. The chmod subroutine changes file access modes.

Parameters

Path Path name of the file for which access is to be revoked.

Return Values

Upon successful completion, the **revoke** subroutine returns a value of 0.

If the revoke subroutine fails, a value of -1 returns and the errno global variable is set to indicate the error.

Error Codes

The **revoke** subroutine fails if any of the following are true:

ENOTDIR A component of the path prefix is not a directory.

EACCES Search permission is denied on a component of the path prefix. **ENOENT** A component of the path prefix does not exist, or the process has the

disallow truncation attribute (see the ulimit subroutine).

ENOENT The path name is null.

ENOENTA symbolic link was named, but the file to which it refers does not exist. **ESTALE**The process's root or current directory is located in a virtual file system that

has been unmounted.

EFAULTThe *Path* parameter points outside of the process's address space. **ELOOP**Too many symbolic links were encountered in translating the path name. **ENAMETOOLONG**A component of a path name exceeds 255 characters, or an entire path name

exceeds 1023 characters.

EIO An I/O error occurred during the operation.

EPERM The effective user ID of the calling process is not the same as the file's owner

ID

EINVAL Access rights revocation is not implemented for this file.

Related Information

The **chmod** subroutine, **frevoke** subroutine.

List of Security and Auditing Subroutines and Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

rintf, rintl, rint, rintd32, rintd64, or rintd128 Subroutine

Purpose

Rounds to the nearest integral value.

Syntax

```
#include <math.h>
float rintf (x)
float x;
long double rintl (x)
long double x;
double rint (x)
double x;
_Decimal32 rintd32(x)
_Decimal32 x;
_Decimal64 rintd64(x)
_Decimal64 x;
_Decimal128 rintd128(x)
_Decimal128 rintd128(x)
```

Description

The **rintf**, **rintl**, **rint rintd32**, **rintd64**, and **rintd128** subroutines return the integral value (represented as a floating-point number) nearest *x* in the direction of the current rounding mode. The current rounding mode is implementation-defined.

The rintf, rintl, rintd, rintd32, rintd64, and rintd128 subroutines differ from the nearbyint, nearbyintf, nearbyintd32, nearbyintd64, and nearbyintd128 subroutines only in that they may raise the inexact floating-point exception if the result differs in value from the argument.

An application wishing to check for error situations should set the **errno** global variable to zero and call feclearexcept(FE ALL EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

Specifies the value to be rounded. х

Return Values

Upon successful completion, the rintf, rintl, rint, rintd32, rintd64, and rintd128subroutines return the integer (represented as a floating-point number) nearest x in the direction of the current rounding mode.

If x is NaN, a NaN is returned.

If x is ± 0 or $\pm \ln x$ is returned.

If the correct value would cause overflow, a range error occurs the rintf, rintf, rintf, rintd32, rintd64, and rintd128 subroutines return the value of the macro ±HUGE_VALF, ±HUGE_VALL, ±HUGE_VAL, ±HUGE_VAL_D32, ±HUGE_VAL_D64, and ±HUGE_VAL_D128 (with the same sign as x), respectively.

math.h in AIX 5L Version 5.3 Files Reference.

rmdir Subroutine

Purpose

Removes a directory.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>

int rmdir (Path) const char *Path;

Description

The **rmdir** subroutine removes the directory specified by the *Path* parameter. If Network File System (NFS) is installed on your system, this path can cross into another node.

For the rmdir subroutine to execute successfully, the calling process must have write access to the parent directory of the Path parameter.

In addition, if the parent directory of *Path* has the Sticky bit attribute (described in the **sys/mode.h** file), the calling process must have one of the following:

- · An effective user ID equal to the directory to be removed
- An effective user ID equal to the owner ID of the parent directory of Path
- Root user authority.

Parameters

Path

Specifies the directory path name. The directory you specify must be:

Empty The directory contains no entries other than . (dot) and .. (dot dot).

Well-formed

If the . (dot) entry in the *Path* parameter exists, it must refer to the same directory as *Path*. Exactly one directory has a link to the *Path* parameter, excluding the self-referential . (dot). If the .. (dot dot) entry in *Path* exists, it must refer to the directory that contains an entry for *Path*.

Return Values

Upon successful completion, the **rmdir** subroutine returns a value of 0. Otherwise, a value of -1 is returned, the specified directory is not changed, and the **errno** global variable is set to indicate the error.

Error Codes

The **rmdir** subroutine fails and the directory is not deleted if the following errors occur:

EACCES There is no search permission on a component of the path prefix, or there is no

write permission on the parent directory of the directory to be removed.

EBUSY The directory is in use as a mount point.

EEXIST or **ENOTEMPTY** The directory named by the *Path* parameter is not empty.

ENAMETOOLONG The length of the *Path* parameter exceeds **PATH_MAX**; or a path-name

component longer than NAME_MAX and POSIX_NO_TRUNC is in effect.

ENOENT The directory named by the *Path* parameter does not exist, or the *Path*

parameter points to an empty string.

ENOTDIR A component specified by the *Path* parameter is not a directory. **EINVAL** The directory named by the *Path* parameter is not well-formed.

EROFS The directory named by the *Path* parameter resides on a read-only file system.

The **rmdir** subroutine can be unsuccessful for other reasons. See Appendix A, "Base Operating System Error Codes For Services That Require Path-Name Resolution" on page A-1 for a list of additional errors.

If NFS is installed on the system, the **rmdir** subroutine fails if the following is true:

ETIMEDOUT The connection timed out.

rmproj Subroutine

Purpose

Removes project definition from kernel project registry.

Library

The libaacct.a library.

Syntax

```
<sys/aacct.h>
```

rmproj(struct project *, int flag)

Description

The **rmproj** subroutine removes the definition of a project from kernel project registry. It takes a pointer to project structure as input argument that holds the name or number of a project that needs to be removed. The flag is set to indicate whether a name or number is supplied as input, as follows:

- PROJ_NAME Indicates that the supplied project definition only has the project name. The rmproj subroutine queries the kernel to obtain a match for the supplied project name and returns the matching entry.
- PROJ_NUM Indicates that the supplied project definition only has the project number. The rmproj subroutine queries the kernel to obtain a match for the supplied project number and returns the matching entry.

Parameters

project Pointer holding the details of the project to be removed.

flag An integer flag which indicates whether the supplied project definition structure has project name

and number that need to be removed.

Security

Only for privileged users. Privilege can be extended to nonroot users by granting the CAP_AACCT capability to a user.

Return Values

0 Success -1 Failure

Error Codes

EINVAL Pointer is null or the *flag* parameter is set to an invalid value.

rmprojdb Subroutine

Purpose

Removes the specified project definition from the specified project database.

Library

The libaacct.a library.

Syntax

<sys/aacct.h>

rmprojdb(void *handle, struct project *project, int flag)

Description

The **rmprojdb** subroutine removes the project definition stored in the struct project variable from the project named by the *handle* parameter. The project database must be initialized before calling this subroutine. The **projdballoc** and **projdbfinit** subroutines are provided for this purpose. If the supplied project definition does not exist in the named project database, the **rmprojdb** subroutine returns -1 and sets errno to **ENOENT**.

The **rmprojdb** subroutine takes a pointer to a project structure as an input argument. This pointer to the project structure holds the name or number of a project that needs to be removed. The flag parameter is set to indicate whether a name or number is supplied as input as follows:

- PROJ_NAME Indicates that the supplied project definition only has the project name.
- PROJ_NUM Indicates that the supplied project definition only has the project number.

There is an internal state (that is, the current project) associated with the project database. When the project database is initialized, the current project is the first project in the database. The **rmprojdb** subroutine removes the named project and repositions the internal current project to the first project definition.

Parameters

handle Pointer to project database handle.

project Pointer to a project structure that holds the definition of the project to be added. Integer flag to indicated whether the name or number of the project is supplied.

Security

Only for privileged users. Privilege can be extended to nonroot users by granting the CAP_AACCT capability to a user.

Return Values

0 Success -1 Failure

Error Codes

ENOENT Project definition does not exist

EPERM Permission denied. The user is not a privileged user.

round, roundf, roundd32, roundd64, or roundd128 Subroutine

Purpose

Rounds to the nearest integer value in a floating-point format.

Syntax

```
#include <math.h>
double round (x)
double x;
float roundf (x)
float x;
long double roundl (x)
long double x;
Decimal32 roundd32(x)
Decimal32 x;
Decimal64 roundd64(x)
Decimal64 x;
_Decimal128 roundd128(x)
_Decimal128 x;
```

Description

The round, roundf, roundd, roundd32, roundd64, and roundd128 subroutines round the x parameter to the nearest integer value in floating-point format, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set the errno global variable to zero and call feclearexcept(FE ALL EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

Specifies the value to be rounded. X

Return Values

Upon successful completion, the round, roundf, roundd, roundd32, roundd64, and roundd128 subroutines return the rounded integer value.

If x is NaN, a NaN is returned.

If x is ± 0 or $\pm \ln x$ is returned.

If the correct value would cause overflow, a range error occurs and the round, roundf, roundl, roundd32, roundd64, and roundd128 subroutines return the value of the macro ±HUGE VAL, ±HUGE VALF, ±HUGE_VALL, ±HUGE_VAL_D32, ±HUGE_VAL_D64 and ±HUGE_VAL_D128 (with the same sign as x), respectively.

rpmatch Subroutine

Purpose

Determines whether the response to a question is affirmative or negative.

Library

Standard C Library (libc. a)

Syntax

#include <stdlib.h>

int rpmatch (Response) const char *Response;

Description

The **rpmatch** subroutine determines whether the expression in the *Response* parameter matches the affirmative or negative response specified by the LC MESSAGES category in the current locale. Both expressions can be extended regular expressions.

Parameters

Response

Specifies input entered in response to a question that requires an affirmative or negative reply.

Return Values

This subroutine returns a value of 1 if the expression in the Response parameter matches the locale's affirmative expression. It returns a value of 0 if the expression in the Response parameter matches the locale's negative expression. If neither expression matches the expression in the Response parameter, a -1 is returned.

Examples

The following example shows an affirmative expression in the En_US locale. This example matches any expression in the Response parameter that begins with a y or Y followed by zero or more alphabetic characters, or it matches the letter o followed by the letter k.

^[yY][:alpha:]* | ok

RSiAddSetHot Subroutine

Purpose

Add a single set of peer statistics to an already defined **SpmiHotSet**.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
struct SpmiHotVals *RSiAddSetHot(rhandle, HotSet, StatName,
GrandParent,
                                 maxresp, threshold, frequency, feed_type,
                                 except type, severity, trap no)
RSiHandle rhandle;
struct SpmiHotSet *HotSet;
char *StatName;
cx handle GrandParent;
int maxresp;
int threshold;
int frequency;
int feed type;
int excp type;
int severity;
int trap no;
```

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

HotSetSpecifies a pointer to a valid structure of type SpmiHotSet as created by the RSiCreateHotSet ("RSiCreateHotSet Subroutine" on page 75) subroutine call.

StatNameSpecifies the name of the statistic within the subcontexts (peer contexts) of the context identified by the *GrandParent* parameter.

GrandParentSpecifies a valid cx_handle handle as obtained by another subroutine call. The handle must identify a context with at least one subcontext, which contains the statistic identified by the StatName parameter. If the context specified is one of the RTime contexts, no subcontext need to be created at the time the **SpmiAddSetHot** subroutine call is issued; the presence of the metric identified by the *StatName* parameter is checked against the context class description.

If the context specified has or may have multiple levels of instantiable context below it (such as the FS and RTime/ARM contexts), the metric is only searched for at the lowest context level. The SpmiHotSet created is a pseudo hotvals structure used to link together a peer group of SpmiHotVals structures, which are created under the covers, one for each subcontext of the GrandParent context. In the case of RTime/ARM, if additional contexts are later added under the GrandParent contexts, additional hotsets are added to the peer group. This is transparent to the application program, except that the **RSiGetHotItem**

("RSiGetHotItem Subroutine" on page 82) subroutine call will return the peer group SpmiHotVals pointer rather than the pointer to the pseudo structure.

Note that specifying a specific volume group context (such as FS/rootvg) or a specific application context (such as RTime/ARN/armpeek) is still valid and won't involve creation of pseudo SpmiHotVals structures.

maxrespMust be non-zero if excp_type specifies that exceptions or SNMP traps must be generated. If specified as zero, indicates that all **SpmiHotItems** that meet the criteria specified by threshold must be returned, up-to a maximum of maxresp items. If both exceptions/traps and feeds are requested, the maxresp value is used to cap the number of exceptions/alerts as well as the number of items returned. If feed_type is specified as SiHotAlways, the maxresp parameter is still used to return at most maxresp

Where the GrandParent argument specifies a context that has multiple levels of instantiable contexts below it, the maxresp is applied to each of the lowest level contexts above the the actual peer contexts at a time. For example, if the GrandParent context is FS (file systems) and the system has three volume groups, then a maxresp value of 2 could cause up to a maximum of 2 x 3 = 6 responses to be generated.

thresholdMust be non-zero if excp type specifies that exceptions or SNMP traps must be generated. If specified as zero, indicates that all values read qualify to be returned in feeds. The value specified is compared to the data value read for each peer statistic. If the data value exceeds the threshold, it qualifies to be returned as an SpmiHotItems element in the SpmiHotVals structure. If the threshold is specified as a negative value, the value qualifies if it is lower than the numeric value of threshold. If feed type is specified as SiHotAlways, the threshold value is ignored for feeds. For peer statistics of type SiCounter, the threshold must be specified as a rate per second; for SiQuantity statistics the threshold is specified as a level.

frequencyMust be non-zero if excp type specifies that exceptions or SNMP traps must be generated. Ignored for feeds. Specifies the minimum number of minutes that must expire between any two exceptions/traps generated from this SpmiHotVals structure. This value must be specified as no less than 5 minutes.

feed typeSpecifies if feeds of SpmiHotItems should be returned for this SpmiHotVals structure. The following values are valid:

- SiHotNoFeedNo feeds should be generated
- SiHotThresholdFeeds are controlled by threshold.
- SiHotAlwaysAll values, up-to a maximum of maxresp must be returned as feeds.

excp typeControls the generation of exception data packets and/or the generation of SNMP Traps from xmservd. Note that these types of packets and traps can only actually be sent if xmservd is running. Because of this, exception packets and SNMP traps are only generated as long as xmservd is active. Traps can only be generated on AIX. The conditions for generating exceptions and traps are controlled by the threshold and frequency parameters. The following values are valid for excp_type:

- SiNoHotExceptionGenerate neither exceptions not traps.
- SiHotExceptionGenerate exceptions but not traps.
- SiHotTrapGenerate SNMP traps but not exceptions.
- SiHotBothGenerate both exceptions and SNMP traps.

severityRequired to be positive and greater than zero if exceptions are generated, otherwise specify as zero. Used to assign a severity code to the exception for display by exmon.

trap noRequired to be positive and greater than zero if SNMP traps are generated, otherwise specify as zero. Used to assign the trap number in the generated SNMP trap.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Return Values

If successful, the subroutine returns a pointer to a structure of type struct SpmiHotVals. If an error occurs, NULL is returned and an error text may be placed in the external character array RSiEMsg. If you attempt to add more values to a statset than the current local buffer size allows, RSiErrno is set to RSiTooMany. If you attempt to add more values than the buffer size of the remote host's xmservd daemon allows, RSiErrno is set to RSiBadStat and the status field in the returned packet is set to too_many_values.

The external integer RSiMaxValues holds the maximum number of values acceptable with the data-consumer's buffer size.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- · extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsq character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

Files

RSiChangeFeed Subroutine

Purpose

Changes the frequency at which the xmservd on the host identified by the first argument daemon is sending data_feed packets for a statset.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h int RSiChangeFeed(rhandle, statset, msecs) RSiHandle rhandle; struct SpmiStatSet *statset; int msecs;

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

statsetMust be a pointer to a structure of type struct SpmiStatSet, which was previously returned by a successful RSiCreateStatSet subroutine call. Data feeding must have been started for this SpmiStatSet via a previous RSiStartFeed ("RSiStartFeed Subroutine" on page 99) subroutine call.

msecsThe number of milliseconds between the sending of data_feed packets. This number is rounded to a multiple of min remote int milliseconds by the xmservd daemon on the remote host. This minimum interval can be modified through the -i command line interval to xmservd.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Return Values

If successful, the subroutine returns zero, otherwise -1. A NULL error text is placed in the external character array RSiEMsg regardless of the subroutine's success or failure.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsq[]:
- · extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

Files

/usr/include/sys/Rsi.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the RSI.

RSiChangeHotFeed Subroutine

Purpose

Changes the frequency at which the **xmservd** on the host identified by the first argument daemon is sending hot feed packets for a statset or checking if exceptions or SNMP traps should be generated.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h int RSiChangeFeed(rhandle, hotset, msecs) RSiHandle rhandle; struct SpmiHotSet *hotset; int msecs;

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

hotsetMust be a pointer to a structure of type struct SpmiHotSet, which was previously returned by a successful RsiCreateHotSet ("RSiCreateHotSet Subroutine" on page 75) subroutine call. Data feeding must have been started for this SpmiHotSet via a previous RSiStartHotFeed ("RSiStartHotFeed Subroutine" on page 100) subroutine call.

msecsThe number of milliseconds between the sending of Hot_feed packets. This number is rounded to a multiple of min remote int milliseconds by the xmservd daemon on the remote host. This minimum interval can be modified through the -i command line interval to xmservd.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Return Values

If successful, the subroutine returns zero, otherwise -1. A NULL error text is placed in the external character array **RSiEMsg** regardless of the subroutine's success or failure.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsq[]:
- · extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiClose Subroutine

Purpose

Terminates the RSI interface for a remote host connection.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h void RSiClose(rhandle) RSiHandle rhandle;

Description

The **RSiClose** subroutine is responsible for:

- 1. Removing the data-consumer program as a known data consumer on a particular host. This is done by sending a **going_down** packet to the host.
- 2. Marking the RSI handle as not active.
- 3. Releasing all memory allocated in connection with the RSI handle.
- 4. Terminating the RSI interface for a remote host.

A successful RSiOpen ("RSiOpen Subroutine" on page 95) subroutine creates tables on the remote host it was issued against. Therefore, a data consumer program that has issued successful RSiOpen subroutine calls should issue an RSiClose ("RSiClose Subroutine" on page 74) subroutine call for each RSiOpen call before the program exits so that the tables in the remote **xmservd** daemon can be released.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen subroutine.

The macro RSilsOpen can be used to test whether an RSI handle is open. It takes an RSiHandle as argument and returns true (1) if the handle is open, otherwise false (0).

Files

/usr/include/sys/Rsi.hDeclares the subroutines, data structures, handles, and macros that an application program can use to access the RSI.

Related Information

For related information, see:

- "RSiInit Subroutine" on page 87

RSiCreateHotSet Subroutine

Purpose

Creates an empty hotset on the remote host identified by the argument.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h struct SpmiHotSet *RSiCreateHotSet(rhandle) RSiHandle rhandle;

Description

The RSiCreateHotSet subroutine allocates an SpmiHotSet structure. The structure is initialized as an empty SpmiHotSet and a pointer to the SpmiHotSet structure is returned.

The SpmiHotSet structure provides the anchor point to a set of peer statistics and must exist before the RSiAddSetHot ("RSiAddSetHot Subroutine" on page 70) subroutine can be successfully called.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

Return Values

The RSiCreateHotSet subroutine returns a pointer to a structure of type SpmiHotSet if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- · extern char RSiEMsg[];
- · extern int RSiErrno:

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsq character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

Files

RSiCreateStatSet Subroutine

Purpose

Creates an empty statset on the remote host identified by the argument.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h struct SpmiStatSet *RSiCreateStatSet(rhandle) RSiHandle rhandle;

Description

The RSiCreateStatSet subroutine allocates an SpmiStatSet structure. The structure is initialized as an empty SpmiStatSet and a pointer to the SpmiStatSet structure is returned.

The SpmiStatSet structure provides the anchor point to a set of statistics and must exist before the RSiPathAddSetStat ("RSiPathAddSetStat Subroutine" on page 97) subroutine can be successfully called.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

Return Values

The RSiCreateStatSet subroutine returns a pointer to a structure of type SpmiStatSet if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

RSiDelSetHot Subroutine

Purpose

Deletes a single set of peer statistics identified by an SpmiHotVals structure from an SpmiHotSet.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h

int RSiDelSetHot(rhandle, hsp, hvp) RSiHandle rhandle; struct SpmiHotSet *hsp; struct SpmiHotVals*hvp;

Description

The RSiDelSetHot subroutine performs the following actions:

- 1. Validates that the **SpmiHotSet** identified by the second argument exists and contains the **SpmiHotVals** statistic identified by the third argument.
- 2. Deletes the SpmiHotVals value from the SpmiHotSet so that future data feed packets do not include the deleted statistic.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

hspMust be a pointer to a structure type struct SpmiHotSet, which was previously returned by a successful RSiCreateHotSet subroutine call.

hvpMust be a handle of type struct SpmiHotVals as returned by a successful RSiAddSetHot ("RSiAddSetHot Subroutine" on page 70) subroutine call. You cannot specify an SpmiHotVals that was internally generated by the Spmi library code as described under the GrandParent parameter to RSiAddSetHot ("RSiAddSetHot Subroutine" on page 70).

Return Values

If successful, the subroutine returns a zero value; otherwise it returns a non-zero value and an error text may be placed in the external character array RSiEMsg.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsq character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

Files

RSiDelSetStat Subroutine

Purpose

Deletes a single statistic identified by an SpmiStatVals pointer from an SpmiStatSet.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
int RSiDelSetStat(rhandle, ssp, svp)
RSiHandle rhandle; struct SpmiStatSet *ssp; struct SpmiStatVals*svp;
```

Description

The **RSiDelSetStat** subroutine performs the following actions:

- 1. Validates the SpmiStatSet identified by the second argument exists and contains the SpmiStatVals statistic identified by the third argument.
- 2. Deletes the SpmiStatVals value from the SpmiStatSet so that future data_feed packets do not include the deleted statistic.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

sspMust be a pointer to a structure type struct SpmiStatSet, which was previously returned by a successful RSiCreateStatSet ("RSiCreateStatSet Subroutine" on page 76) subroutine call.

svpMust be a handle of type struct SpmiStatVals as returned by a successful RSiPathAddSetStat ("RSiPathAddSetStat Subroutine" on page 97) subroutine call.

Return Values

If successful, the subroutine returns a zero value; otherwise it returns a non-zero value and an error text may be placed in the external character array RSiEMsg.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno:

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

Files

/usr/include/sys/Rsi.h

RSiFirstCx Subroutine

Purpose

Returns the first subcontext of an SpmiCx context.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
struct SpmiCxLink *RSiFirstCx(rhandle, context, name,
descr)
RSiHandle rhandle;
cx_handle *context;
char **name;
char **descr;
```

Description

The **RSiFirstCx** subroutine performs the following actions:

- 1. Validates that the context identified by the second argument exists.
- 2. Returns a handle to the first element of the list of subcontexts defined for the context.
- 3. Returns the short name and description of the subcontext.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

contextMust be a handle of type cx_handle, which was previously returned by a successful RSiPathGetCx ("RSiPathGetCx Subroutine" on page 98) subroutine call.

nameMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the short name of the subcontext is returned in the character array pointer.

descrMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the description of the subcontext is returned in the character array pointer.

Return Values

If successful, the subroutine returns a pointer to a structure of type **struct SpmiCxLink**. If an error occurs or if the context doesn't contain subcontexts, NULL is returned and an error text may be placed in the external character array **RSiEMsg**.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

Files

/usr/include/sys/Rsi.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the RSI.

RSiFirstStat Subroutine

Purpose

Returns the first statistic of an **SpmiCx** context.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
struct SpmiStatLink *RSiFirstStat(rhandle, context, name,
descr)
RSiHandle rhandle;
cx_handle *context;
char **name;
char **descr;
```

Description

The **RSiFirstStat** subroutine performs the following actions:

- 1. Validates that the context identified by the second argument exists.
- 2. Returns a handle to the first element of the list of statistics defined for the context.
- 3. Returns the short name and description of the statistic.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

contextMust be a handle of type cx_handle, which was previously returned by a successful RSiPathGetCx ("RSiPathGetCx Subroutine" on page 98) subroutine call.

nameMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the short name of the statistics value is returned in the character array pointer.

descrMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the description of the statistics value is returned in the character array pointer.

Return Values

If successful, the subroutine returns a pointer to a structure of type **struct SpmiStatLink**. If an error occurs, NULL is returned and an error text may be placed in the external character array **RSiEMsg**.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno:

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiGetHotItem Subroutine

Purpose

Locates and decodes the next **SpmiHotItems** element at the current position in an incoming data packet of type **hot_feed**.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
struct SpmiHotVals *RSiGetHotItem(rhandle, HotSet, index, value,
absvalue, name)
RSiHandle rhandle;
struct SpmiHotSet **HotSet;
```

int *index;
float *value;
flost absvalue;
char **name;

Description

The **RSiGetHotItem** subroutine locates the **SpmiHotItems** structure in the **hot_feed** data packet indexed by the value of the *index* parameter. The subroutine returns a NULL value if no further **SpmiHotItems** structures are found. The **RSiGetHotItem** subroutine should only be executed after a successful call to the **RSiGetHotSet** subroutine.

The **RSiGetHotItem** subroutine is designed to be used for walking all **SpmiHotItems** elements returned in a **hot_feed** data packet. Because the data packet may contain elements belonging to more than one **SpmiHotSet**, the *index* is purely abstract and is only used to keep position. By feeding the updated integer pointed to by *index* back to the next call, the walking of the **hot_feed** packet can be done in a tight loop. Successful calls to **RSiGetHotItem** will decode each **SpmiHotItems** element and return the data value in *value* and the name of the peer context that owns the corresponding statistic in *name*.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

value

name

rhandle Must be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine"

on page 95) subroutine.

HotSet Used to return a pointer to a valid SpmiHotSet structure as obtained by a previous

RSiCreateHotSet ("RSiCreateHotSet Subroutine" on page 75) subroutine call. The calling program can use this value to locate the SpmiHotSet if its address was stored by the program after it was created. The time stamps in the SpmiHotSet are updated with the time stamps of the decoded

SpmiHotItems element.

index A pointer to an integer that contains the desired relative element number in the **SpmiHotItems** array across all **SpmiStatVals** contained in the data packet. A value of zero points to the first element.

When the **RSiGetHotItem** subroutine returns, the integer contain the index of the mext

SpmiHotItems element in the data packet. By passing the returned *index* parameter to the next call to **RSiGetHotItem**, the calling program can iterate through all **SpmiHotItems** elements in the

hot_feed data packet.

A pointer to a float variable. A successful call will return the decoded data value of the peer statistic. Before the value is returned, the **RSiGetHotItem** function:

- Determines the format of the data field as being either **SiFloat** or **SiLong** and extracts the data value for further processing.
- Determines the data value as being either type SiQuantity or type SiCounter and performs one of the actions listed here:
 - If the data value is of type SiQuantity, the subroutine returns the val field of the SpmiHotItems structure.
 - If the data value is of type SiCounter, the subroutine returns the value of the val_change field
 of the SpmiHotItems structure divided by the elapsed number of seconds since the previous
 time a data value was requested for this set of statistics.

absvalue A pointer to a float variable. A successful call will return the decoded value of the val field of the

SpmiHotItems structure of the peer statistic. In case of a statistic of type **SiQuantity**, this value will be the same as the one returned in the argument *value*. In case of a peer statistic of type **SiCounter**,

the value returned is the absolute value of the counter.

A pointer to a character pointer. A successful call will return a pointer to the name of the peer context

for which the data value was read.

Return Values

The **RSiGetHotItem** subroutine returns a pointer to the current **SpmiHotVals** structure within the hotset. If no more **SpmiHotItems** elements are available, the subroutine returns a NULL value. The structure

returned contains the data, such as threshold, which may be relevant for presentation of the results of an SpmiGetHotSet subroutine call to end-users. In the returned SpmiHotVals structure, all fields contain the correct values as declared, except for the following:

stat Declared as SpmiStatHdl, actually points to a valid SpmiStat structure. By casting the handle to a

pointer to SpmiStat, data in the structure can be accessed.

Contains the cx_handle for the parent context of the peer contexts. grandpa

When using the Spmi interface this is an array of SpmiHotItems structures. When using the items

RSiGetHotItem subroutine, the array is empty and attempts to access it will likely result in

segmentation faults or access of not valid data.

Will contain the path to the parent of the peer contexts. Even when the peer contexts are multiple path

levels below the parent context, the path points to the top context because the peer context identifiers in the SpmiHotItems elements will contain the path name from there and on. For example,

if the hotvals peer set defines all volume groups, the path specified in the returned SpmiHotVals structure would be "FS" and the path name in one SpmiHotItems element may be "rootvg/Iv01". When combined with the metric name from the stat field, the full path name can be constructed as,

for example, "FS/rootvg/lv01/%totfree".

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsq[];
- extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

RSiGetRawValue Subroutine

Purpose

Returns a pointer to a valid SpmiStatVals structure for a given SpmiStatVals pointer by extraction from a data feed packet. This subroutine call should only be issued from a callback function after it has been verified that a data_feed packet was received from the host identified by the first argument.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h

```
struct SpmiStatVals RSiGetRawValue(rhandle, svp, index)
RSiHandle rhandle;
struct SpmiStatVals *svp;
int *index;
```

Description

The RSiGetRawValue subroutine performs the following:

- 1. Finds an **SpmiStatVals** structure in the received data packet based upon the second argument to the subroutine call. This involves a lookup operation in tables maintained internally by the RSi interface.
- 2. Updates the **struct SpmiStat** pointer in the **SpmiStatVals** structure to point at a valid **SpmiStat** structure.
- 3. Returns a pointer to the **SpmiStatVals** structure. The returned pointer points to a static area and is only valid until the next execution of **RSiGetRawValue**.
- 4. Updates an integer variable with the index into the **ValsSet** array of the **data_feed** packet, which corresponds to the second argument to the call.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

svpA handle of type struct SpmiStatVals, which was previously returned by a successful RSiPathAddSetStat ("RSiPathAddSetStat Subroutine" on page 97) subroutine call.

indexA pointer to an integer variable. When the subroutine call succeeds, the index into the **ValsSet** array of the data feed packet is returned. The index corresponds to the element that matches the **svp** argument to the subroutine.

Return Values

If successful, the subroutine returns a pointer; otherwise NULL is returned and an error text may be placed in the external character array **RSiEMsg**.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno:

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiGetValue Subroutine

Purpose

Returns a data value for a given SpmiStatVals pointer by extraction from the data feed packet. This subroutine call should only be issued from a callback function after it has been verified that a data feed packet was received from the host identified by the first argument.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h float RSiGetValue(rhandle, svp) RSiHandle rhandle; struct SpmiStatVals *svp;

Description

The **RSiGetValue** subroutine provides the following:

- 1. Finds an SpmiStatVals structure in the received data packet based upon the second argument to the subroutine call. This involves a lookup operation in tables maintained internally by the RSi interface.
- 2. Determines the format of the data field as being either SiFloat or SiLong and extracts the data value for further processing based upon its data format.
- 3. Determines the value as either of type SiQuantity or SiCounter. If the former is the case, the data value returned is the val field in the SpmiStatVals structure. If the latter type is found, the value returned by the subroutine is the val change field divided by the elapsed number of seconds since the previous data packet's time stamp.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

svpA handle of type struct SpmiStatVals, which was previously returned by a successful RSiPathAddSetStat ("RSiPathAddSetStat Subroutine" on page 97) subroutine call.

Return Values

If successful, the subroutine returns a non-negative value; otherwise it returns a negative value less than or equal to -1.0. A NULL error text is placed in the external character array RSiEMsg regardless of the subroutine's success or failure.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno:

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

RSilnit Subroutine

Purpose

Allocates or changes the table of RSi handles.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h RSiHandle RSiInit(count) int count;

Description

Before any other RSi call is executed, a data-consumer program must issue the RSiInit call. Its purpose is to either:

- Allocate an array of RSiHandleStruct structures and return the address of the array to the data-consumer program.
- · Increase the size of a previously allocated array of RSiHandleStruct structures and initialize the new array with the contents of the previous one.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

countMust specify the number of elements in the array of RSi handles. If the call is used to expand a previously allocated array, this argument must be larger than the current number of array elements, it must always be larger than zero. Specify the size of the array to be at least as large as the number of hosts your data-consumer program can talk to at any point in time.

Return Values

If successful, the subroutine returns the address of the allocated array. If an error occurs, an error text is placed in the external character array RSiEMsg and the subroutine returns NULL. When used to increase the size of a previously allocated array, the subroutine first allocates the new array, then moves the entire old array to the new area. Application programs should, therefore, refer to elements in the RSi handle

array by index rather than by address if they anticipate the need for expanding the array. The array only needs to be expanded if the number of remote hosts a data-consumer program talks to might increase over the life of the program.

An application that calls RSilnit repeatedly needs to preserve the previous address of the RSiHandle array while the **RSiInit** call is re-executed. After the call has completed successfully, the calling program should free the previous array using the free subroutine.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsq[];
- · extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsq character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

/usr/include/sys/Rsi.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the RSI.

Related Information

For related information, see the "RSiClose Subroutine" on page 74.

RSiInstantiate Subroutine

Purpose

Creates (instantiates) all subcontexts of an **SpmiCx** context object.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h int RSiInstantiate(rhandle, context) RSiHandle *rhandle*; cx handle *context;

Description

The **RSiInstantiate** subroutine performs the following actions:

- 1. Validates that the context identified by the second argument exists.
- 2. Instantiates the context so that all subcontexts of that context are created in the context hierarchy. Note that this subroutine call currently only makes sense if the context's SilnstFreq is set to SiContInst or SiCfgInst because all other contexts would have been instantiated whenever the xmservd daemon was started.

The **RSi**Instantiate subroutine explicitly instantiates the subcontexts of an instantiable context. If the context is not instantiable, do not call the RSiInstantiate subroutine.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust point to a structure of type **RSiHandle**, which was previously initialized by the **RSiOpen** ("**RSiOpen Subroutine**" on page 95) subroutine.

contextMust be a handle of type cx_handle, which was previously returned by a successful RSiPathGetCx ("RSiPathGetCx Subroutine" on page 98) subroutine call.

Return Values

If successful, the subroutine returns a zero value; otherwise it returns an error code as defined in **SiError** and an error text may be placed in the external character array **RSiEMsg**.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- · extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

Files

/usr/include/sys/Rsi.h

RSilnvite Subroutine

Purpose

Invites data suppliers on the network to identify themselves and returns a table of data-supplier host names.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
char **RSiInvite(resy_callb, excp_callb)
int (*resy_callb)();
int (*excp_callb)();
```

Description

The RSilnvite subroutine call broadcasts are you there messages on the network to provoke xmservd daemons on remote hosts to respond and returns a table of all responding hosts.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

The arguments to the subroutine are:

resy_callbMust be either NULL or a pointer to a function that processes i_am_back packets as they are received from the xmservd daemons on remote hosts for the duration of the RSilnvite subroutine call. When the callback function is invoked, it is passed three arguments as described in the following information.

If this argument is specified as NULL, a callback function internal to the RSilnvite subroutine receives any i am back packets and uses them to build the table of host names the function returns.

excp callbMust be NULL or a pointer to a function that processes **except** rec packets as they are received from the xmservd daemons on remote hosts. If a NULL pointer is passed, your application does not receive except rec messages. When this callback function is invoked, it is passed three arguments as described in the following information.

This argument always overrides the corresponding argument of any previous **RSilnvite** or **RSiOpen** call, and it can be overridden by subsequent executions of either. In this way, your application can turn exception monitoring on and off. For an RSiOpen to override the exception processing specified by a previous open call, the connection must first be closed with the RSiClose call. That's because an **RSiOpen** against an already active handle is treated as a no-operation.

The **resy callb** and **excp callb** functions in your application are called with the following three arguments:

- · An RSiHandle. The RSi handle pointed to is almost certain not to represent the host that sent the packet. Ignore this argument, and use only the second one: the pointer to the input buffer.
- A pointer of type pack * to the input buffer containing the received packet. Always use this pointer rather than the pointer in the **RSiHandle** structure.
- A pointer of type struct sockaddr in * to the IP address of the originating host.

Return Values

If successful, the subroutine returns an array of character pointers, each of which contains a host name of a host that responded to the invitation. The returned host names are actually constructed as two "words" with the first one being the host name returned by the host in response to an are you there request; the second one being the character form of the host's IP address. The two "words" are separated by one or more blanks. This format is suitable as an argument to the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine call. In addition, the external integer variable RSilnvTabActive contains the number of host names found. The returned pointer to an array of host names must not be freed by the subroutine call. The calling program should not assume that the pointer returned by this subroutine call remains valid after subsequent calls to RSilnvite. If the call is not successful, an error text is placed in the external character array RSiEMsq, an error number is placed in RSiErrno, and the subroutine returns NULL.

The list of host names returned by **RSilnvite** does not include the hosts your program has already established a connection with through an RSiOpen call. Your program is responsible for keeping track of such hosts. If you need a list of both sets of hosts, either let the RSilnvite call be the first one issued from your program or merge the list of host names returned by the call with the list of hosts to which you have connections.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsq[];
- extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

Files

/usr/include/sys/Rsi.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the RSI.

Related Information

For related information, see "RSiOpen Subroutine" on page 95.

RSiMainLoop Subroutine

Purpose

Allows an application to suspend execution and wait to get awakened when data feeds arrive.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h void RSiMainLoop(msecs) int *msecs*;

Description

The **RSiMainLoop** subroutine:

- 1. Allows the data-consumer program to suspend processing while waiting for data_feed packets to arrive from one or more xmservd daemons.
- 2. Tells the subroutine that waits for data feeds to return control to the data-consumer program so that the latter can check for and react to other events.
- 3. Invokes the subroutine to process data_feed packets for each such packet received.

To work properly, the RSiMainLoop subroutine requires that at least one RSiOpen ("RSiOpen Subroutine" on page 95) call has been successfully completed and that the connection has not been closed.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

msecsThe minimum elapsed time in milliseconds that the subroutine should continue to attempt receives before returning to the caller. Notice that your program releases control for as many milliseconds you specify but that the callback functions defined on the RSiOpen call may be called repetitively during that time.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

Files

/usr/include/sys/Rsi.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the RSI.

Related Information

For related information, see "RSiOpen Subroutine" on page 95.

RSiNextCx Subroutine

Purpose

Returns the next subcontext of an SpmiCx context.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
struct SpmiCxLink *RSiNextCx(rhandle, context, link, name,
descr)
RSiHandle rhandle:
cx handle *context;
struct SpmiCxLink *link;
char **name;
char **descr;
```

Description

The RSiNextCx subroutine:

- 1. Validates that the context identified by the second argument exists.
- 2. Returns a handle to the next element of the list of subcontexts defined for the context.
- 3. Returns the short name and description of the subcontext.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust point to a structure of type RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

contextMust be a handle of type cx_handle, which was previously returned by a successful RSiPathGetCx ("RSiPathGetCx Subroutine" on page 98) subroutine call.

linkMust be a pointer to a structure of type **struct SpmiCxLink**, which was previously returned by a successful **RSiFirstCx** ("**RSiFirstCx Subroutine**" on page 80) or **RSiNextCx** subroutine call.

nameMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the short name of the subcontext is returned in the character array pointer.

descrMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the description of the subcontext is returned in the character array pointer.

Return Values

If successful, the subroutine returns a pointer to a structure of type **struct SpmiCxLink**. If an error occurs, or if no more subcontexts exist for the context, NULL is returned and an error text may be placed in the external character array **RSiEMsq**.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno:

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiNextStat Subroutine

Purpose

Returns the next statistic of an SpmiCx context.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h
struct SpmiStatLink *RSiNextStat(rhandle, context, link, name,
descr)
RSiHandle rhandle;

cx handle *context: struct SpmiStatLink *link; char **name; char **descr;

Description

The RSiNextStat subroutine:

- 1. Validates that a context identified by the second argument exists.
- 2. Returns a handle to the next element of the list of statistics defined for the context.
- 3. Returns the short name and description of the statistic.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

contextMust be a handle of type cx handle, which was previously returned by a successful RSiPathGetCx ("RSiPathGetCx Subroutine" on page 98) subroutine call.

linkMust be a pointer to a structure of type struct SpmiStatLink, which was previously returned by a successful RSiFirstStat ("RSiFirstStat Subroutine" on page 81) or RSiNextStat subroutine call.

nameMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the short name of the statistics value is returned in the character array pointer.

descrMust be a pointer to a pointer to a character array. The pointer must be initialized to point at a character array pointer. When the subroutine call is successful, the description of the statistics value is returned in the character array pointer.

Return Values

If successful, the subroutine returns a pointer to a structure of type struct SpmiStatLink. If an error occurs, or if no more statistics exists for the context, NULL is returned and an error text may be placed in the external character array RSiEMsg.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno:

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiOpen Subroutine

Purpose

Initializes the RSi interface for a remote host.

Library

RSI Library (libSpmi.a)

Syntax

Description

The **RSiOpen** subroutine performs the following actions:

- 1. Establishes the issuing data-consumer program as a data consumer known to the **xmservd** daemon on a particular host. The subroutine does this by sending an **are_you_there** packet to the host.
- 2. Initializes an RSi handle for subsequent use by the data-consumer program.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

The arguments to the subroutine are:

rhandleMust point to an element of the **RSiHandleStruct** array, which is returned by a previous **RSiInit** ("**RSiInit Subroutine**" on page 87) call. If the subroutine is successful the structure is initialized and ready to use as a handle for subsequent RSi interface subroutine calls.

waitMust specify the timeout in milliseconds that the RSi interface shall wait for a response when using the request-response functions. On LANs, a reasonable value for this argument is 100 milliseconds. If the response is not received after the specified wait time, the library subroutines retry the receive operation until five times the wait time has elapsed before returning a timeout indication. The wait time must be zero or more milliseconds.

bufsizeSpecifies the maximum buffer size to be used for constructing network packets. This size must be at least 4,096 bytes. The buffer size determines the maximum packet length that can be received by your program and sets the limit for the number of data values that can be received in one **data_feed** packet. There's no point in setting the buffer size larger than that of the **xmservd** daemon because both must be

able to handle the packets. If you need large sets of values, you can use the command line argument -b of **xmservd** to increase its buffer size up to 16,384 bytes.

The fixed part of a data_feed packet is 104 bytes and each value takes 32 bytes. A buffer size of 4,096 bytes allows up to 124 values per packet.

hostIDMust be a character array containing the identification of the remote host whose xmservd daemon is the one with which you want to talk. The first characters of the host identification (up to the first white space) is used as the host name. The full host identification is stored in the RSiHandle field longname and may contain any description that helps the end user identify the host used. The host name may be either in long format (including domain name) or in short format.

feed_callbMust be a pointer to a function that processes data_feed packets as they are received from the xmservd daemon. When this callback function is invoked, it is passed three arguments as described in the following information.

resy callbMust be a pointer to a function that processes i am back packets as they are received from the **xmservd** daemon. When this callback function is invoked it is passed three arguments as described in the following information.

excp callbMust be NULL or a pointer to a function that processes **except** rec packets as they are received from the xmservd daemon. If a NULL pointer is passed, your application does not receive except rec messages. When this callback function is invoked, it is passed three arguments as described in the following information. This argument always overrides the corresponding argument of any previous RSilnvite ("RSilnvite Subroutine" on page 89) or RSiOpen ("RSiOpen Subroutine" on page 95) subroutine call and can itself be overridden by subsequent executions of either. In this way, your application can turn exception monitoring on and off. For an RSiOpen call to override the exception processing specified by a previous open call, the connection must first be closed with the RSiClose ("RSiClose Subroutine" on page 74) subroutine call.

The **feed_callb**, **resy_callb**, and **excp_callb** functions are called with the arguments:

RSiHandle. When a data_feed packet is received, the structure pointed to is guaranteed to represent the host sending the packet. In all other situations the RSiHandle structure may represent any of the hosts to which your application is talking.

Pointer of type pack * to the input buffer containing the received packet. In callback functions, always use this pointer rather than the pointer in the **RSiHandle** structure.

Pointer of type struct sockaddr_in * to the IP address of the originating host.

Return Values

If successful, the subroutine returns zero and initializes the array element of type RSiHandle pointed to by rhandle. If an error occurs, error text is placed in the external character array RSiEMsq and the subroutine returns a negative value.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno:

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiPathAddSetStat Subroutine

Purpose

Add a single statistics value to an already defined SpmiStatSet.

Library

RSI Library (libSpmi.a)

Syntax

```
#include sys/Rsi.h
struct SpmiStatVals *RSiPathAddSetStat(rhandle, statset,
RSiHandle rhandle;
struct SpmiStatSet *statset;
char *path;
```

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

statsetMust be a pointer to a structure of type struct SpmiStatSet, which was previously returned by a successful RSiCreateStatSet ("RSiCreateStatSet Subroutine" on page 76) subroutine call.

pathMust be the full value path name of the statistics value to add to the SpmiStatSet. The value path name must not include a terminating slash. Note that value path names never start with a slash.

Return Values

If successful, the subroutine returns a pointer to a structure of type **struct SpmiStatVals**. If an error occurs, NULL is returned and an error text may be placed in the external character array RSiEMsg. If you attempt to add more values to a statset than the current local buffer size allows, RSiErrno is set to RSiTooMany. If you attempt to add more values than the buffer size of the remote host's xmservd daemon allows, RSiErrno is set to RSiBadStat and the status field in the returned packet is set to too_many_values.

The external integer RSiMaxValues holds the maximum number of values acceptable with the data-consumer's buffer size.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- · extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiPathGetCx Subroutine

Purpose

Searches the context hierarchy for an **SpmiCx** context that matches a context path name.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h
cx_handle *RSiPathGetCx(rhandle, path)
RSiHandle rhandle;
char *path;

Description

The **RSiPathGetCx** subroutine performs the following actions:

- 1. Searches the context hierarchy for a given path name of a context.
- 2. Returns a handle to be used when subsequently referencing the context.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

pathA path name of a context for which a handle is to be returned. The context path name must be the full path name and must not include a terminating slash. Note that context path names never start with a slash.

Return Values

If successful, the subroutine returns a handle defined as a pointer to a structure of type **cx_handle**. If an error occurs, NULL is returned and an error text may be placed in the external character array **RSiEMsg**.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSiErrno** variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

RSiStartFeed Subroutine

Purpose

Tells xmservd to start sending data feeds for a statset.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h
int RSiStartFeed(rhandle, statset, msecs)
RSiHandle rhandle;
struct SpmiStatSet *statset;
int msecs;

Description

The **RSiStartFeed** subroutine performs the following function:

- 1. Informs xmservd of the frequency with which it is required to send data_feed packets.
- 2. Tells the **xmservd** to start sending **data_feed** packets.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

statsetMust be a pointer to a structure of type struct SpmiStatSet, which was previously returned by a successful RSiCreateStatSet ("RSiCreateStatSet Subroutine" on page 76) subroutine call.

msecsThe number of milliseconds between the sending of data_feed packets. This number is rounded to a multiple of min_remote_int milliseconds by the xmservd daemon on the remote host. This minimum interval can be modified through the -i command line interval to xmservd.

Return Values

If successful, the subroutine returns zero; otherwise it returns -1 and an error text may be placed in the external character array RSiEMsg.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno:

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

RSiStartHotFeed Subroutine

Purpose

Tells **xmservd** to start sending hot feeds for a hotset or to start checking for if exceptions or SNMP traps should be generated.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h

int RSiStartFeed(rhandle, hotset, msecs) RSiHandle rhandle; struct SpmiHotSet *hotset; int *msecs*;

Description

The **RSiStartHotFeed** subroutine performs the following function:

- 1. Informs **xmservd** of the frequency with which it is required to send **hot feed** packets, if the hotset is defined to generate hot feed packets.
- 2. Informs **xmservd** of the frequency with which it is required to check if exceptions or SNMP traps should be generated. This is only done if it is specified for the hotset that exceptions and/or SNMP traps should be generated.
- 3. Tells the **xmservd** to start sending **data feed** packets and/or start checking for exceptions or traps.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

hotsetMust be a pointer to a structure of type struc SpmiHotSet, which was previously returned by a successful RSiCreateHot ("RSiCreateHotSet Subroutine" on page 75) subroutine call.

msecsThe number of milliseconds between the sending of hot_feed packets and/or the number of milliseconds between checks for if exceptions or SNMP traps should be generated. This number is rounded to a multiple of min remote int milliseconds by the xmservd daemon on the remote host. This minimum interval can be modified through the -i command line interval to xmservd.

Return Values

If successful, the subroutine returns zero; otherwise it returns -1 and an error text may be placed in the external character array RSiEMsq.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

RSiStatGetPath Subroutine

Purpose

Finds the full path name of a statistic identified by a **SpmiStatVals** pointer.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h char *RSiStatGetPath(rhandle, svp) RSiHandle *rhandle*; struct SpmiStatVals *svp;

Description

The **RSiStatGetPath** subroutine performs the following:

- 1. Validates that the SpmiStatVals statistic identified by the second argument does exist.
- 2. Returns a pointer to a character array containing the full value path name of the statistic.

The memory area pointed to by the returned pointer is freed when the RSiStatGetPath subroutine call is repeated. For each invocation of the subroutine, a new memory area is allocated and its address returned.

If the calling program needs the returned character string after issuing the RSiStatGetPath subroutine call, the program must copy the returned string to locally allocated memory before reissuing the subroutine call.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust be an RSiHandle, previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

svpMust be a handle of type struct SpmiStatVals as returned by a successful RSiPathAddSetStat ("RSiPathAddSetStat Subroutine" on page 97) subroutine call.

Return Values

If successful, the RSiStatGetPath subroutine returns a pointer to a character array containing the full path name of the statistic. If unsuccessful, the subroutine returns a NULL value and an error text may be placed in the external character array RSiEMsg.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

RSiStopFeed Subroutine

Purpose

Tells **xmservd** to stop sending data feeds for a statset.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h int RSiStopFeed(rhandle, statset, erase) RSiHandle rhandle; struct SpmiStatSet *statset; boolean erase;

Description

The **RSiStopFeed** subroutine instructs the **xmservd** of a remote system to:

- 1. Stop sending data_feed packets for a given SpmiStatSet. If the daemon is not told to erase the SpmiStatSet, feeding of data can be resumed by issuing the RSiStartFeed ("RSiStartFeed Subroutine" on page 99) subroutine call for the SpmiStatSet.
- 2. Optionally tells the daemon and the API library subroutines to erase all their information about the SpmiStatSet. Subsequent references to the erased SpmiStatSet are not valid.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust point to a structure of type RSiHandle, which was previously initialized by the RSiOpen ("RSiOpen Subroutine" on page 95) subroutine.

statsetMust be a pointer to a structure of type struct SpmiStatSet, which was previously returned by a successful RSiCreateStatSet ("RSiCreateStatSet Subroutine" on page 76) subroutine call. Data feeding must have been started for this SpmiStatSet via a previous RSiStartFeed ("RSiStartFeed Subroutine" on page 99) subroutine call.

eraself this argument is set to true, the xmservd daemon on the remote host discards all information about the named SpmiStatSet. Otherwise the daemon maintains its definition of the set of statistics.

Return Values

If successful, the subroutine returns zero, otherwise -1. A NULL error text is placed in the external character array RSiEMsg regardless of the subroutine's success or failure.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- · extern int RSiErrno;

If the subroutine returns without an error, the **RSiErrno** variable is set to **RSiOkay** and the **RSiEMsg** character array is empty. If an error is detected, the **RSi**Errno variable returns an error code, as defined in the enum **RSiErrorType**. RSi error codes are described in *List of RSi Error Codes*.

Files

RSiStopHotFeed Subroutine

Purpose

Tells **xmservd** to stop sending hot feeds for a hotset and to stop checking for exception and SNMP trap generation.

Library

RSI Library (libSpmi.a)

Syntax

#include sys/Rsi.h
int RSiStopFeed(rhandle, hotset, erase)
RSiHandle rhandle;
struct SpmiHotSet *hotset;
boolean erase;

Description

The **RSiStopHotFeed** subroutine instructs the **xmservd** of a remote system to:

- Stop sending hot_feed packets or check if exceptions or SNMP traps should be generated for a given SpmiHotSet. If the daemon is not told to erase the SpmiHotSet, feeding of data can be resumed by issuing the RSiStartHotFeed ("RSiStartHotFeed Subroutine" on page 100) subroutine call for the SpmiHotSet.
- 2. Optionally tells the daemon and the API library subroutines to erase all their information about the **SpmiHotSet**. Subsequent references to the erased **SpmiHotSet** are not valid.

This subroutine is part of the Performance Toolbox for AIX licensed product.

Parameters

rhandleMust point to a structure of type **RSiHandle**, which was previously initialized by the **RSiOpen** ("**RSiOpen Subroutine**" on page 95) subroutine.

hotsetMust be a pointer to a structure of type struct SpmiHotSet, which was previously returned by a successful RSiCreateHotSet ("RSiCreateHotSet Subroutine" on page 75) subroutine call. Data feeding must have been started for this SpmiStatSet via a previous RSiStartHotFeed ("RSiStartHotFeed Subroutine" on page 100) subroutine call.

eraself this argument is set to true, the xmservd daemon on the remote host discards all information about the named SpmiHotSet. Otherwise the daemon maintains its definition of the set of statistics.

Return Values

If successful, the subroutine returns zero, otherwise -1. A NULL error text is placed in the external character array **RSiEMsq** regardless of the subroutine's success or failure.

Error Codes

All RSI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char RSiEMsg[];
- extern int RSiErrno;

If the subroutine returns without an error, the RSiErrno variable is set to RSiOkay and the RSiEMsg character array is empty. If an error is detected, the RSiErrno variable returns an error code, as defined in the enum RSiErrorType. RSi error codes are described in List of RSi Error Codes.

rs alloc Subroutine

Purpose

Allocates a resource set and returns its handle.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> rsethandle t rs alloc (flags) unsigned int flags;

Description

The **rs_alloc** subroutine allocates a resource set and initializes it according to the information specified by the flags parameter. The value of the flags parameter determines how the new resource set is initialized.

The handle for the new resource set is returned by the subroutine.

Parameters

flags

Specifies how the new resource set is initialized. It takes one of the following values, defined in rset.h:

- RS_EMPTY (or 0 value): The resource set is initialized to contain no resources.
- RS SYSTEM: The resource set is initialized to contain available system resources.
- RS_ALL: The resource set is initialized to contain all resources.
- RS_PARTITION: The resource set is initialized to contain the resources in the caller's process partition resource set.

Return Values

On successful completion, a resource set handle for the new resource set is returned. Otherwise, a value of 0 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The rs_alloc subroutine is unsuccessful if one or more of the following are true:

The *flags* parameter contains an invalid value.

ENOMEM There is not enough space to create the data structures related to the resource set.

Related Information

"rs_free Subroutine" on page 107, "rs_getinfo Subroutine" on page 109, and "rs_init Subroutine" on page 115.

rs discardname Subroutine

Purpose

Discards a resource set definition from the system resource set registry.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> int rs_discardname(namespace, rsname) char *namespace, *rsname;

Description

The rs_discardname subroutine discards from the system global repository the definition of the resource set. The resource set is identified by the namespace and rsname parameters. The specified resource set is removed from the registry, and can no longer be shared with other applications.

In order to be able to discard a name from the global repository, the calling process must have root authority or CAP_NUMA_ATTACH capability, and an effective user ID equal to that of the rsname parameter's creator. CAP_NUMA_ATTACH allows non-root users to create or remove an exclusive rset.

The **rs_discardname** subroutine is used to remove an exclusive *rset*. When an exclusive *rset* is removed, the state of CPUs in that rset is modified so that those CPUs can run any work on the system. Root

authority is required to remove an exclusive rset. See Exclusive use processor resource sets in Operating system and device management and the rmrset command for more information.

Parameters

Points to a null terminated string corresponding to the name space within which rsname should be namespace

rsname Points to a null terminated string corresponding to the name of a registered resource set to be

discarded.

Return Values

If successful, a value of 0 is returned. Otherwise, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The **rs** discardname subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following is true:

- The rsname parameter contains a null value.
- The namespace parameter contains a null value.
- The *rsname* or *namespace* parameters point to an invalid name.
- · The name length is null or greater than the RSET_NAME_SIZE constant (defined in rset.h), or the name contains invalid characters.

EPERM One of the following is true:

- · The calling process has neither root authority nor CAP_NUMA_ATTACH capability.
- · The calling process has neither the same user ID as the creator of the rsname definition nor root authority.
- The namespace parameter starts with sys. This name space is reserved for system use.

EFAULT

Invalid address, and/or exceptions outside errno range.

Related Information

"rs_getnameattr Subroutine" on page 110, "rs_registername Subroutine" on page 119, and "rs getnamedrset Subroutine" on page 112.

The rmrset command.

rs free Subroutine

Purpose

Frees a resource set.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> void rs_free(rset) rsethandle t rset;

Description

The rs_free subroutine frees a resource set identified by the rset parameter. The resource set must have been allocated by the rs_alloc subroutine

Parameters

Specifies the resource set whose memory will be freed.

Related Information

The "rs alloc Subroutine" on page 105.

rs_getassociativity Subroutine

Purpose

Gets the hardware associativity values for a resource.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs_getassociativity (type, id, assoc_array, array_size)
unsigned int type;
unsigned int id;
unsigned int *assoc array;
unsigned int array_size;
```

Description

The rs_getassociativity subroutine returns the array of hardware associativity values for a specified resource.

This is a special purpose subroutine intended for specialized root applications needing the hardware associativity value information. The rs_getinfo, rs_getrad, and rs_numrads subroutines are provided for non-root applications to discover system hardware topology.

The calling process must have root authority to get hardware associativity values.

Parameters

type Specifies the resource type whose associativity values are requested. The only value supported to

retrieve values for a processor is R_PROCS.

Specifies the logical resource id whose associativity values are requested.

Specifies the address of an array of unsigned integers to receive the associativity values. assoc_array

Specifies the number of unsigned integers in assoc_array. array_size

Return Values

If successful, a value of 0 is returned. The assoc_array parameter array contains the resource's associativity values. The first entry in the array indicates the number of associativity values returned. If the hardware system does not provide system topology data, a value of 0 is returned in the first array entry. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The rs_getassociativity subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following occurred:

• The array_size parameter was specified as 0.

· An invalid type parameter was specified.

ENODEV EFAULT

The resource specified by the *id* parameter does not exist. Invalid address.

EPERM The calling process does not have root authority.

Related Information

"rs getinfo Subroutine," "rs getrad Subroutine" on page 114, and "rs numrads Subroutine" on page 116.

rs_getinfo Subroutine

Purpose

Gets information about a resource set.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs_getinfo(rset, info_type, flags)
rsethandle_t rset;
rsinfo t info type;
unsigned int flags;
```

Description

The **rs_getinfo** subroutine retrieves information about the resource set identified by the *rset* parameter. Depending on the value of the *info type* parameter, the **rs getinfo** subroutine returns information about the number of available processors, the number of available memory pools, or the amount of available memory contained in the resource rset. The subroutine can also return global system information such as the maximum system detail level, the symmetric multiprocessor (SMP) and multiple chip module (MCM) system detail levels, and the maximum number of processor or memory pool resources in a resource set.

Parameters

rset

Specifies a resource set handle of a resource set the information should be retrieved from. This parameter is not meaningful if the info_type parameter is R_MAXSDL, R_MAXPROCS, R_MAXMEMPS, R_SMPSDL, or R_MCMSDL.

info_type

Specifies the type of information being requested. One of the following values (defined in rset.h) can be used:

- · R_LGPGDEF: The number of defined large pages in the resource set is returned in units of megabytes.
- R_LGPGFREE: The number of free large pages in the resource set is returned in units of megabytes.
- R_NUMPROCS: The number of available processors in the resource set is returned.
- · R_NUMMEMPS: The number of available memory pools in the resource set is returned.
- R_MEMSIZE: The amount of available memory (in MB) contained in the resource set is returned.
- R_MAXSDL: The maximum system detail level of the system is returned.
- · R_MAXPROCS: The maximum number of processors that may be contained in a resource set is
- R_MAXMEMPS: The maximum number of memory pools that may be contained in a resource set is returned.
- R_SMPSDL: The system detail level that corresponds to the traditional notion of an SMP is returned. A system detail level of 0 is returned if the hardware system does not provide system topology data.
- R_MCMSDL: The system detail level that corresponds to resources packaged in an MCM is returned. A system detail level of 0 is returned if the hardware system does not have MCMs or does not provide system topology data.

flags

Reserved for future use. Specify as 0.

Return Values

If successful, the requested information is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **rs_getinfo** subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following is true:

- The *info_type* parameter specifies an invalid resource type value.
- The flags parameter was not specified as 0.

EFAULT

Invalid address.

Related Information

The "rs numrads Subroutine" on page 116.

rs_getnameattr Subroutine

Purpose

Retrieves the access control information of a resource set definition in the system resource set registry.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> int rs_getnameattr(namespace, rsname, attr) char *namespace, *rsname; rs_attributes_t *attr;

Description

The rs getnameattr subroutine retrieves from the system resource set registry the access control information of the resource set definition specified by the *namespace* and *rsname* parameters.

The owner ID, group ID, and access control information of the specified resource set are stored in the structure pointed to by the attr parameter.

Note: No special authority or access permission is required to query this information.

Parameters

namespace

Points to a null terminated string corresponding to the name space within which the rsname parameter should be found.

rsname attr

Points to a null terminated string corresponding to the name the information should be retrieved for. Points to an rs_attributes_t structure containing the owner, group, and mode fields, which will be filled by the subroutine. The mode field in the rs_attributes_t structure is used to store the access permissions, and is constructed by logically ORing one or more of the following values, defined in rset.h:

- RS_IRUSR: Gives read rights to the name's owner.
- RS_IWUSR: Gives write rights to the name's owner.
- · RS_IRGRP: Gives read rights to users of the same group as the name's owner.
- · RS_IWGRP: Gives write rights to users of the same group as the name's owner.
- · RS_IROTH: Gives read rights to others.
- · RS_IWOTH: Gives write rights to others.

Read privilege for a user means that the user can retrieve a resource set definition by issuing a call to the rs_getnamedrset subroutine. Write privilege for a user means that the user can redefine a name by issuing another call to the rs_getnamedrset subroutine.

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **rs getnameattr** subroutine is unsuccessful if one or more of the following are true:

EINVAL

If one of the following is true:

- · The rsname parameter is a null pointer.
- The namespace parameter is a null pointer.
- The rsname or namespace parameters point to an invalid name. The name length is 0 or greater than the RSET_NAME_SIZE constant (defined in rset.h), or the rsname parameter contains invalid characters.

ENOENT

The rsname parameter could not be found in the name space identified by the namespace

parameter.

EFAULT

Invalid address.

rs_getnamedrset Subroutine

Purpose

Retrieves the contents of a named resource set from the system resource set registry.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs getnamedrset (namespace, rsname, rset)
char *namespace, *rsname;
```

Description

The rs_getnamedrset subroutine retrieves a resource set definition from the system registry. The namespace and rsname parameters identify the resource set to be retrieved. The rset parameter identifies where the retrieved resource set should be returned. The namespace and rsname parameters identify a previously registered resource set definition.

The calling process must have root authority or read access rights to the resource set definition in order to retrieve it.

The rset parameter must be allocated (using the rs_alloc subroutine) prior to calling the rs_getnamedrset subroutine.

Parameters

namespace rsname rset

Points to a null-terminated string corresponding to the name space within which rsname is found. Points to a null-terminated string corresponding to the previously registered name of a resource set. Specifies the resource set handle for the resource set that the registered resource set is copied into. The registered resource set is specified by the *rsname* parameter.

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **rs getnamedrset** subroutine is unsuccessful if one or more of the following are true:

EINVAL

One of the following is true:

- The *rsname* parameter is a null pointer.
- The namespace parameter is a null pointer.
- The rsname or namespace parameters point to an invalid name. The name length is 0 or greater than the RSET_NAME_SIZE constant (defined in rset.h), or the rsname parameter contains invalid characters.

ENOENT

The rsname parameter could not be found in the name space identified by the namespace parameter.

EPERM

The calling process has neither read permission on rsname nor root authority.

EFAULT

Invalid address.

Related Information

"rs_alloc Subroutine" on page 105, "rs_registername Subroutine" on page 119, "rs_getnameattr Subroutine" on page 110, and "rs_discardname Subroutine" on page 106.

rs_getpartition Subroutine

Purpose

Gets the partition resource set to which a process is attached.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> int rs getpartition (pid, rset) pid t pid; rsethandle t rset;

Description

The rs_getpartition subroutine returns the partition resource set attached to the specified process. A process ID value of RS MYSELF indicates the partition resource set attached to the current process is requested.

The return value from the rs_getpartition subroutine indicates the type of resource set returned.

A value of RS_PARTITION_RSET indicates the process has a partition resource set that is set explicitly. This may be set with the rs_setpartition subroutine or through the use of WLM work classes with resource sets.

A value of RS DEFAULT RSET indicates the process did not have an explicitly set partition resource set. The system default resource set is returned.

Parameters

pid Specifies the process ID whose partition rset is requested.

rset Specifies the resource set to receive the process' partition resource set.

Return Values

If successful, a value of RS_PARTITION_RSET, or RS_DEFAULT_RSET is returned. If unsuccessful, a value of -1 is returned and the global errno variable is set to indicate the error.

Error Codes

The rs_getpartition subroutine is unsuccessful if one or more of the following are true:

EFAULT Invalid address.

ESRCH The process identified by the pid parameter does not exist.

Related Information

The "ra_getrset Subroutine" on page 22.

rs_getrad Subroutine

Purpose

Returns a system resource allocation domain (RAD) contained in an input resource set.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs getrad (rset, rad, sdl, index, flags)
rsethandle_t rset, rad;
unsigned int sdl;
unsigned int index;
unsigned int flags;
```

Description

The rs_getrad subroutine returns a system RAD at a specified system detail level and index that is contained in an input resource set. If only some of the resources in the specified system RAD are contained in the input resource set, only the resources in both the system RAD and the input resource set are returned.

The input resource set is specified by the *rset* parameter. The output system RAD is identified by the *rad* parameter.

The system RAD is specified by system detail level sdl and index number index. If only a portion of the specified RAD is contained in *rset*, only that portion is returned in *rad*.

The rset and rad parameters must be allocated (using the rs alloc subroutine) prior to calling the rs getrad subroutine.

Parameters

rset Specifies a resource set handle for the input resource set.

rad Specifies a resource set handle to receive the desired system RAD (contained in the rset parameter).

sdl Specifies the system detail level of the desired system RAD. index

Specifies the index of the system RAD that should be returned from among those at the specified sdl. This parameter must belong to the [0, rs_numrads(rset, sdl, flags)-1] interval.

The following flags (defined in rset.h) can be used to modify the default behavior of the rs_getrad subroutine. By default, the rs_getrad subroutine empties the resource set specified by rad before the specified RAD is retrieved.

- RS_UNION: Instead of emptying rad before the specified RAD is retrieved, the RAD retrieved is added to the contents of rad. On completion, rad contains the union of its original contents and the specified
- RS EXCLUSION: Instead of emptying rad before the specified RAD is retrieved, the resources in the specified RAD that are also in rad are removed from rad. On return, rad contains all the resources it originally contained except those in the specified RAD.

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

flags

Error Codes

The **rs_getrad** subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following is true:

- · The flags parameter contains an invalid value.
- The sdl parameter is greater than the maximum system detail level.
- · The RAD specified by the index parameter does not exist at the system detail level specified by the sdl parameter.

EFAULT Invalid address.

Related Information

"rs_numrads Subroutine" on page 116, "rs_getinfo Subroutine" on page 109, and "rs_alloc Subroutine" on page 105.

rs init Subroutine

Purpose

Initializes a previously allocated resource set.

Library

Standard C library (libc.a)

Syntax

#include <sys/rset.h> int rs_init (rset, flags) rsethandle t rset; unsigned int flags;

Description

The rs_init subroutine initializes a previously allocated resource set. The resource set is initialized according to information specified by the flags parameter.

Parameters

rset

Specifies the handle of the resource set to initialize.

flags

Specifies how the resource set is initialized. It takes one of the following values, defined in rset.h:

- RS_EMPTY: The resource set is initialized to contain no resources.
- RS_SYSTEM: The resource set is initialized to contain available system resources.
- RS ALL: The resource set is initialized to contain all resources.
- · RS_PARTITION: The resource set is initialized to contain the resources in the caller's process partition resource set.

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The **rs_init** subroutine is unsuccessful if one or more of the following are true:

EINVAL

The *flags* parameter contains an invalid value.

Related Information

The "rs_alloc Subroutine" on page 105.

rs_numrads Subroutine

Purpose

Returns the number of system resource allocation domains (RADs) that have available resources.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs_numrads(rset, sdl, flags)
rsethandle t rset;
unsigned int sdl;
unsigned int flags;
```

Description

The rs_numrads subroutine returns the number of system RADs at system detail level sdl, that have available resources contained in the resource set identified by the rset parameter.

The number of atomic RADs contained in the rset parameter is returned if the sdl parameter is equal to the maximum system detail level.

Parameters

rset Specifies the resource set handle for the resource set being queried. sdl Specifies the system detail level in which the caller is interested.

Reserved for future use. Specify as 0. flags

Return Values

If successful, the number of available RADs at system detail level sdl, that have resources contained in the specified resource set is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The rs_numrads subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following is true:

- The *flags* parameter contains an invalid value.
- The sdl parameter is greater than the maximum system detail level.

EFAULT Invalid address.

Related Information

"rs_getrad Subroutine" on page 114, and "rs_getinfo Subroutine" on page 109.

rs_op Subroutine

Purpose

Performs a set of operations on one or two resource sets.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs op (command, rset1, rset2, flags, id)
unsigned int command;
rsethandle_t rset1, rset2;
unsigned int flags;
unsigned int id;
```

Description

The **rs_op** subroutine performs the operation specified by the *command* parameter on resource set *rset1* or both resource sets rset1 and rset2.

Parameters

command

Specifies the operation to apply to the resource sets identified by rset1 and rset2. One of the following values, defined in rset.h, can be used:

- RS UNION: The resources contained in either rset1 or rset2 are stored in rset2.
- RS_INTERSECTION: The resources that are contained in both rset1 and rset2 are stored in rset2.
- RS_EXCLUSION: The resources in rset1 that are also in rset2 are removed from rset2. On completion, rset2 contains all the resources that were contained in rset2 but were not contained in
- RS_COPY: All resources in rset1 whose type is flags are stored in rset2. If rset1 contains no resources of this type, rset2 will be empty. The previous content of rset2 is lost, while the content of rset1 is unchanged.
- RS_FIRST: The first resource whose type is flags is retrieved from rset1 and stored in rset2. If rset1 contains no resources of this type, rset2 will be empty.
- RS_NEXT: The resource from rset1 whose type is flags and that follows the resource contained in rset2 is retrieved and stored in rset2. If no resource of the appropriate type follows the resource specified in rset2, rset2 will be empty.
- RS_NEXT_WRAP: The resource from rset1 whose type is flags and that follows the resource contained in rset2 is retrieved and stored in rset2. If no resource of the appropriate type follows the resource specified in rset2, rset2 will contain the first resource of this type in rset1.
- RS ISEMPTY: Test if resource set rset1 is empty.
- RS_ISEQUAL: Test if resource sets rset1 and rset2 are equal.
- RS ISCONTAINED: Test if all resources in resource set rset1 are also contained in resource set rset2.
- RS_TESTRESOURCE: Test if the resource whose type is flags and index is id is contained in resource set rset1.
- RS_ADDRESOURCE: Add the resource whose type is *flags* and index is *id* to resource set *rset1*.
- RS_DELRESOURCE: Delete the resource whose type is flags and index is id from resource set rset1.
- · RS_STSET: Constructs an ST resource set by including only one hardware thread per physical processor included in rset1 and stores it in rset2. Only available processors are considered when constructing the ST resource set.

rset1

Specifies the resource set handle for the first of the resource sets involved in the command operation.

rset2

Specifies the resource set handle for the second of the resource sets involved in the command operation. This resource set is also used, on return, to store the result of the operation, and its previous content is lost. The rset2 parameter is ignored on the RS_ISEMPTY, RS_TESTRESOURCE, RS_ADDRESOURCE, and RS_DELRESOURCE commands.

flags

When combined with the RS COPY command, the flags parameter specifies the type of the resources that will be copied from rset1 to rset2. When combined with an RS_FIRST or an RS_NEXT command, the flags parameter specifies the type of the resource that will be retrieved from rset1. This parameter is constructed by logically ORing one or more of the following values, defined in rset.h:

- R_PROCS: processors
- R_MEMPS: memory pools
- R_ALL_RESOURCES: processors and memory pools

id

If none of the above are specified for *flags*, R_ALL_RESOURCES is assumed. On the RS_TESTRESOURCE, RS_ADDRESOURCE, and RS_DELRESOURCE commands, the id parameter specifies the index of the resource to be tested, added, or deleted. This parameter is ignored on the other commands.

Return Values

If successful, the commands RS_ISEMPTY, RS_ISEQUAL, RS_ISCONTAINED, and RS_TESTRESOURCE return 0 if the tested condition is not met and 1 if the tested condition is met. All other commands return 0 if successful. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **rs_op** subroutine is unsuccessful if one or more of the following are true:

EINVAL

If one of the following is true:

- · rset1 identifies an invalid resource set.
- · rset2 identifies an invalid resource set.
- command identifies an invalid operation.
- · command is RS_NEXT or RS_NEXT_WRAP*, and rset2 does not contain a single resource.
- · command is RS_NEXT or RS_NEXT_WRAP*, and the single resource contained in rset2 is not also contained in rset1.
- · flags identifies an invalid resource type.
- · id specifies a resource index that is too large.

EFAULT

Invalid address.

Related Information

The "rs_alloc Subroutine" on page 105.

rs registername Subroutine

Purpose

Registers a resource set definition in the system resource set registry.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs registername(rset, namespace, rsname, mode, command)
rsethandle t rset;
char *namespace, *rsname;
unsigned int mode, command;
```

Description

The rs_registername subroutine registers in the system resource registry (within the name space identified by namespace) the definition of the resource set identified by the rset handle. The rs_registername subroutine does this by associating with it the name specified by the null terminated string structure pointed to by rsname.

If rsname does not exist, the owner and group IDs of rsname are set to the caller's owner and group IDs, and the access control information for rsname is set according to the mode parameter.

If rsname already exists, its owner and group IDs and its access control information are left unchanged, and the mode parameter is ignored. This name can be shared with any applications to identify a dedicated resource set.

Using the command parameter, you can ask to overwrite or not to overwrite the rsname parameter's registration if it already exists in the global repository within the name space identified by namespace. If rsname already exists within the specified name space and the command parameter is set to not overwrite, an error is reported to the calling process.

The namespace **sysxrset** is reserved for exclusive *rsets*. When an exclusive *rset* is created, the state of CPUs in the rset is modified so that those CPUs only run work that is directed to them. See Exclusive use processor resource sets in Operating system and device management and the mkrset command for more information. Root privilege or CAP_NUMA_ATTACH capability is required to create or remove an exclusive rset. An exclusive rset cannot be overwritten.

Notes:

- 1. Registering a resource set definition can only be done by a process that has root authority or CAP_NUMA_ATTACH capability. CAP_NUMA_ATTACH allows non-root users to create or remove an exclusive *rset*.
- 2. Overwriting an existing name's registration can be done only by a process that has root authority or write access to this name.

An application registered resource set definition is non-persistent. It does not persist over a system boot.

Both the *namespace* and *rsname* parameters may contain up to 255 characters. They must begin with an ASCII alphanumeric character. Only the period (.), minus (-), and underscore () characters can be mixed with ASCII alphanumeric characters within these strings. Moreover, the names are case-sensitive, which means there is a difference between uppercase and lowercase letters in resource set names and name spaces.

Parameters

rset

Specifies a resource set handle of a resource set a name should be registered for.

namespace

Points to a null terminated string corresponding to the name space within which rsname will be registered.

rsname

Points to a null terminated string corresponding to the name registered with the setting of the resource set specified by rset.

mode

Specifies the bit pattern that determines the created name access permissions. It is constructed by logically ORing one or more of the following values, defined in rset.h:

- RS_IRUSR: Gives read rights to the name's owner
- RS_IWUSR: Gives write rights to the name's owner
- RS_IRGRP: Gives read rights to users of the same group as the name's owner
- RS_IWGRP: Gives write rights to users of the same group as the name's owner
- · RS_IROTH: Gives read rights to others
- · RS IWOTH: Gives write rights to others

Read privilege for a user means that the user can retrieve a resource set definition (by issuing a call to the rs_getnamedrset subroutine). Write privilege for a user means that the user can redefine a name (by issuing another call to the rs_getnamedrset subroutine).

command

Specifies whether the rsname parameter's registration should be overwritten if it already exists in the global repository. This parameter takes one of the following values, defined in rset.h:

- RS_REDEFINE: The rsname parameter should be redefined if it already exists in the name space identified by namespace. In such a case, the calling process must have write access to rsname.
- RS_DEFINE: The rsname parameter should not be redefined if it already exists in the name space identified by *namespace*. If this happens, an error is reported to the calling process

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The rs_registername subroutine is unsuccessful if one or more of the following are true:

EINVAL

If one of the following is true:

- · rsname is a null pointer.
- · namespace is a null pointer.
- · rsname or namespace points to an invalid name. The name length is 0 or greater than the RSET_NAME_SIZE constant (defined in rset.h), or the name contains invalid characters.
- · mode identifies an invalid access rights value.
- · command identifies an invalid command value.

EEXIST

The command parameter is set to RS_DEFINE and rsname already exists in the global repository within the name space identified by *namespace*.

ENOMEM **EPERM**

There is not enough space to create the data structures related to the registry of this resource set. If one of the following is true:

- The command parameter is set to RS_REDEFINE and the calling process has neither write access to rsname nor root authority.
- The calling process has neither the attachment privilege nor root authority.
- The namespace parameter starts with sys. This name space is reserved for system use.

EFAULT

Invalid address, and/or exceptions outside errno range.

Related Information

"rs_getnameattr Subroutine" on page 110, "rs_discardname Subroutine" on page 106, and "rs getnamedrset Subroutine" on page 112.

The mkrset command.

rs setnameattr Subroutine

Purpose

Sets the access control information of a resource set definition in the system resource set registry.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs_setnameattr (namespace, rsname, command, attr)
char *namespace, *rsname;
unsigned int command;
rs_attributes_t * attr;
```

Description

The rs_setnameattr subroutine sets (depending on the command value) one or more of the owner, group, or access control information of the system registry resource set definition specified by the namespace and rsname parameters.

The owner ID and/or group ID and/or access control information of the rsname parameter must be supplied in the structure pointed to by the attr parameter.

Notes:

- 1. In order to be able to set the attributes of a name, the calling process must have root authority or the attachment privilege and an effective user ID equal to that of the rsname parameter's owner.
- 2. Root authority is required to change the resource set definition owner ID, or to set its group ID outside of the caller's list of groups.

Parameters

command

attr

namespace Points to a null terminated string corresponding to the name space within which rsname should be

rsname Points to a null terminated string corresponding to the name the information should be retrieved

Specifies which attributes should be changed. This parameter is constructed by logically ORing one or more of the following values, defined in rset.h:

• RS_OWNER: Set owner as specified in the *owner* field of *attr*.

• RS_GROUP: Set group as specified in the group field of attr.

RS_PERM: Set access control information as specified in the mode field of attr.

Points to an rs_attributes_t structure containing the owner, group and mode fields, which will possibly be used by the subroutine for setting attributes. The mode field is used to store the access permissions, and is constructed by logically ORing one or more of the following values,

defined in rset.h:

• RS_IRUSR: Gives read rights to the name's owner

· RS_IWUSR: Gives write rights to the name's owner

RS_IRGRP: Gives read rights to users of the same group as the name's owner

• RS_IWGRP: Gives write rights to users of the same group as the name's owner

• RS IROTH: Gives read rights to the others

· RS_IWOTH: Gives write rights to the others

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **rs setnameattr** subroutine is unsuccessful if one or more of the following are true:

EINVAL One of the following is true:

- · rsname is a null pointer.
- · namespace is a null pointer.
- rsname or namespace point to an invalid name. Name length is 0 or greater than the RSET_NAME_SIZE constant (defined in **rset.h**), or name contains invalid characters.
- · command identifies an invalid command value.
- command includes RS_PERM and the mode field of attr identifies an invalid access rights value.
- attr is a null pointer.

EPERM One of the following is true:

- The calling process has neither CAP_NUMA_ATTACH attachment privilege nor root authority.
- · command includes RS_OWNER and the owner field of attr is different from the caller's user ID and the caller does not have root authority.
- · command includes RS_GROUP, the group field of attr is outside of the caller's list of groups, and caller does not have root authority.
- The namespace parameter starts with sys. This name space is reserved for system use.

ENOENT rsname could not be found in the name space identified by namespace. **ENOSPC** Out of file-space blocks.

Invalid address; exceptions outside errno range. **EFAULT**

ENOSYS The **rs_setnameattr** subroutine is not supported by the system.

Related Information

The "rs_getnameattr Subroutine" on page 110.

rs_setpartition Subroutine

Purpose

Sets the partition resource set of a process.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/rset.h>
int rs_setpartition(pid, rset, flags)
pid t \overline{p}id;
rsethandle t rset;
unsigned int flags;
```

Description

The rs_setpartition subroutine sets a process' partition resource set. The subroutine can also be used to remove a process' partition resource set.

The partition resource set limits the threads in a process to running only on the processors contained in the partition resource set.

The work component is an existing process identified by the process ID. A process ID value of RS_MYSELF indicates the attachment applies to the current process.

The following conditions must be met to set a process' partition resource set:

- The calling process must have root authority.
- The resource set must contain processors that are available in the system.
- The new partition resource set must be equal to, or a superset of the target process' effective resource set.
- The target process must not contain any threads that have bindprocessor bindings to a processor.
- The resource set must be a superset of all the threads' rset in the target process.

The *flags* parameter can be set to indicate the policy for using the resources contained in the resource set specified in the rset parameter. The only supported scheduling policy is R_ATTACH_STRSET, which is useful only when the processors of the system are running in simultaneous multi-threading mode.

Processors like the POWER5 support simultaneous multi-threading, where each physical processor has two execution engines, called hardware threads. Each hardware thread is essentially equivalent to a single processor, and each is identified as a separate processor in a resource set. The R_ATTACH_STRSET flag indicates that the process is to be scheduled with a single-threaded policy; namely, that it should be scheduled on only one hardware thread per physical processor. If the R_ATTACH_STRSET flag is specified, then all of the available processors indicated in the resource set must be of exclusive use (the processor must belong to some exclusive use processor resource set). A new resource set, called an ST resource set, is constructed from the specified resource set and attached to the process according to the following rules:

- · All offline processors are ignored.
- If all the hardware threads (processors) of a physical processor (when running in simultaneous multi-threading mode, there will be more than one active hardware thread per physical processor) are not included in the specified resource set, the other processors of the processor are ignored when constructing the ST resource set.
- Only one processor (hardware thread) resource per physical processor is included in the ST resource set.

Parameters

pid Specifies the process ID of the process whose partition resource set is to be set. A value of RS MYSELF indicates the current process' partition resource set should be set.

Specifies the partition resource set to be set. A value of RS_DEFAULT indicates the process' partition rset resource set should be removed.

flags Specifies the policy to use for the process. A value of R_ATTACH_STRSET indicates that the process is to be scheduled with a single-threaded policy (only on one hardware thread per physical processor).

Return Values

If successful, a value of 0 is returned. If unsuccessful, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The **rs** setpartition subroutine is unsuccessful if one or more of the following are true:

EINVAL The R_ATTACH_STRSET flags parameter is specified and one or more processors in the rset

parameter are not assigned for exclusive use.

ENODEV The resource set specified by the rset parameter does not contain any available processors, or the

R_ATTACH_STRSET flags parameter is specified and the constructed ST resource set does not

have any available processors.

ESRCH The process identified by the pid parameter does not exist.

EFAULT Invalid address. **ENOMEM** Memory not available. **EPERM** One of the following is true:

- The calling process does not have root authority.
- · The process identified by the pid parameter has one or more threads with a bindprocessor processor binding.
- The process identified by the pid parameter has an effective resource set and the new partition resource set identified by the *rset* parameter does not contain all of the effective resource set's resources.
- · One of the threads in the process identified by the pid parameter has a thread level resource set, and the new partition resource set identified by the rset parameter does not contain all of the thread level resource set's resources.

Related Information

The "rs_getpartition Subroutine" on page 113 and "ra_attachrset Subroutine" on page 11.

For more information about exclusive processors, see Exclusive use processor resource sets in *Operating* system and device management.

rsqrt Subroutine

Purpose

Computes the reciprocal of the square root of a number.

Libraries

IEEE Math Library (libm.a)

System V Math Library (libmsaa.a)

Syntax

#include <math.h>

double rsqrt(double x)

Description

The **rsqrt** command computes the reciprocal of the square root of a number x; that is, 1.0 divided by the square root of x (1.0/sqrt(x)). On some platforms, using the **rsqrt** subroutine is faster than computing 1.0 / sqrt(x). The **rsqrt** subroutine uses the same rounding mode used by the calling program.

When using the **libm.a** library, the **rsqrt** subroutine responds to special values of x in the following ways:

- If x is NaN, then the **rsqrt** subroutine returns NaN. If x is a signaling Nan (NaNS), then the **rsqrt** subroutine returns a quiet NaN and sets the VX and VXSNAN (signaling NaN invalid operation exception) flags in the FPSCR (Floating-Point Status and Control register) to 1.
- If x is +/- 0.0, then the **rsqrt** subroutine returns +/- INF and sets the **ZX** (zero divide exception) flag in the FPSCR to 1.
- If x is negative, then the **rsqrt** subroutine returns NaN, sets the **errno** global variable to **EDOM**, and sets the VX and VXSQRT (square root of negative number invalid operation exception) flags in the FPSCR to 1.

When using the **libmsaa.a** library, the **rsqrt** subroutine responds to special values of x in the following

- If x is +/- 0.0, then the **rsqrt** subroutine returns +/-HUGE VAL and sets the **errno** global variable to **EDOM**. The subroutine invokes the **matherr** subroutine, which prints a message indicating a singularity error to standard error output.
- If x is negative, then the **rsqrt** subroutine returns 0.0 and sets the **errno** global variable to **EDOM**. The subroutine invokes the matherr subroutine, which prints a message indicating a domain error to standard error output.

When compiled with libmsaa.a, a program can use the matherr subroutine to change these error-handling procedures.

Parameter

Specifies a double-precision floating-point value.

Return Values

Upon successful completion, the **rsqrt** subroutine returns the reciprocal of the square root of x.

1.0 If *x* is 1.0. +0.0 If x is +INF.

Error Codes

When using either the libm.a or libmsaa.a library, the rsqrt subroutine may return the following error code:

EDOM The value of x is negative.

Related Information

The matherr subroutine, sqrt or cbrt ("sqrt, sqrtf, sqrtl, sqrtd32, sqrtd64, and sqrtd128 Subroutines" on page 288) subroutine.

rstat Subroutines

Purpose

Gets performance data from remote kernels.

Library

(librpcsvc.a)

Syntax

#include <rpcsvc/rstat.h> rstat (host, statp) char *host; struct statstime *statp;

Description

The rstat subroutine gathers statistics from remote kernels. These statistics are available on items such as paging, swapping and CPU utilization.

Parameters

Specifies the name of the machine going to be contacted to obtain statistics found in the statp parameter. host Contains statistics from host. statp

Return Values

If successful, the rstat subroutine fills in the statstime for host and returns a value of 0.

Files

/usr/include/rpcsvc/rstat.x

Related Information

The **rup** command.

The rstatd daemon

sameguantumd32, sameguantumd64, or sameguantumd128 Subroutine

Purpose

Determines if the representation exponents of both the parameters are same.

Syntax

```
#include <math.h>
Bool samequantumd32 (x, y)
Decimal32 x;
_Decimal32 y;
Bool samequantumd64 (x, y)
Decimal64 x;
Decimal64 y;
Bool samequantumd128 (x, y)
Decimal 128 x;
_Decimal128 y;
```

Description

The samequantumd32, samequantumd64, and samequantumd128 subroutines determine if the representation exponents of the x and y parameters are the same. If the values of both x and y parameters are NaN, or infinities, they have the same representation exponents; if exactly one operand is infinity, or exactly one operand is NaN, they do not have the same representation exponents. These subroutines raise no exception.

Parameters

```
Specifies the value to be computed.
Specifies the value to be computed.
```

Return Values

The samequantumd32, samequantumd64, and samequantumd128 subroutines return true when x and y parameters have the same representation exponents, false otherwise.

scalbin, scalbin, scalbin, scalbin, scalbin, or scalb Subroutine

Purpose

Computes the exponent using FLT RADIX=2.

Syntax

```
#include <math.h>
double scalbln (x, n)
double x;
long n;
```

```
float scalblnf (x, n)
float x;
long n;
long double scalbln1 (x, n)
long double x;
long n;
double scalbn (x, n)
double x;
int n;
float scalbnf (x, n)
float x;
int n;
long double scalbnl (x, n)
long double x;
int n;
double scalb(x, y)
double x, y;
```

Description

The **scalbin**, **scalbin**, **scalbin**, **scalbin**, **scalbin**, and **scalbin** subroutines compute $x * FLT_RADIX^n$ efficiently, not normally by computing FLT_RADIX^n explicitly. For AIX, $FLT_RADIX^n = 2$.

The **scalb** subroutine returns the value of the *x* parameter times 2 to the power of the y parameter.

An application wishing to check for error situations should set the **errno** global variable to zero and call **feclearexcept**(**FE_ALL_EXCEPT**) before calling these subroutines. Upon return, if **errno** is nonzero or **fetestexcept**(**FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW**) is nonzero, an error has occurred.

Parameters

x Specifies the value to be computed.n Specifies the value to be computed.

Return Values

Upon successful completion, the **scalbin**, **scalbin**, **scalbin**, **scalbin**, **scalbin**, and **scalbin** subroutines return $x * FLT_RADIX^n$.

If the result would cause overflow, a range error occurs and the **scalbin**, **scalbin**, **scalbin**, **scalbin**, **scalbin**, and **scalbin** subroutines return \pm **HUGE_VAL**, \pm **HUGE_VALF**, and \pm **HUGE_VALL** (according to the sign of x) as appropriate for the return type of the function.

If the correct value would cause underflow, and is not representable, a range error may occur, and 0.0 is returned.

If x is NaN, a NaN is returned.

If x is ± 0 or $\pm \ln \ln x$ is returned.

If n is 0, x is returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value is returned.

Error Codes

If the correct value would overflow, the scalb subroutine returns +/-INF (depending on a negative or positive value of the x parameter) and sets errno to ERANGE.

If the correct value would underflow, the scalb subroutine returns a value of 0 and sets errno to ERANGE.

scalbind32, scalbind64, scalbind128, scalbind32, scalbind64, or scalbnd128 Subroutine

Purpose

Computes the exponent using FLT_RADIX=10.

Syntax

```
#include <math.h>
_Decimal32 scalblnd32 (x, n)
Decimal32 x;
long n;
Decimal64 scalblnd64 (x, n)
Decimal64 x;
long n;
Decimal 128 scalb lnd128 (x, n)
Decimal 128 x;
\overline{long} n;
Decimal 32 scalbind 32 (x, n)
Decimal32 x;
int n;
_Decimal64 scalbnd64 (x, n)
Decimal64 x;
int n;
Decimal 128 scalbnd 128 (x, n)
Decimal 128 x;
int n;
```

Description

The scalbind32, scalbind64, scalbind128, scalbind32, scalbind64, and scalbind128 subroutines compute x * FLT RADIXⁿ efficiently, not normally by computing FLT RADIXⁿ explicitly. For AIX, FLT RADIX =10.

An application checking for error situations should set the value of the errno global variable to zero and call the feclearexcept(FE ALL EXCEPT) subroutine before calling these subroutines. Upon return, if the value of the errno global variable is nonzero or the fetestexcept(FE INVALID | FE DIVBYZERO | FE OVERFLOW | FE UNDERFLOW) subroutine is nonzero, an error has occurred.

Parameters

- Specifies the value to be computed. х
- Specifies the exponent of 10.

Return Values

Upon successful completion, the scalbind32, scalbind64, scalbind128, scalbind32, scalbind64, and **scalbnd128** subroutines return $x * FLT RADIX^n$.

If the result causes overflow, a range error occurs and the scalbind32, scalbind64, scalbind128, scalbnd32, scalbnd64, and scalbnd128 subroutines return ±HUGE_VAL_D32, ±HUGE_VAL_D64, and **±HUGE VAL D128** (according to the sign of x) as appropriate for the return type of the function.

If the correct value causes underflow, and is not representable, a range error occurs, and 0.0 is returned.

If x is NaN, a NaN is returned.

If x is ± 0 or $\pm \ln \ln x$ is returned.

If n is 0, x is returned.

If the correct value causes underflow, and is representable, a range error occurs and the correct value is returned.

Related Information

feclearexcept subroutine, fetestexcept subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

scandir, scandir64, alphasort or alphasort64 Subroutine

Purpose

Scans or sorts directory contents.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/types.h>
#include <sys/dir.h>
int scandir(DirectoryName,NameList,Select,Compare)
char * DirectoryName;
struct dirent * (* NameList []);
int (* Select) (struct dirent *);
int (* Compare)(void *, void *);
int alphasort ( Directory1, Directory2)
void *Directory1, *Directory2;
```

```
int scandir64(DirectoryName,NameList,Select,Compare)
char * DirectoryName;
struct dirent64 * (* NameList [ ]);
int (* Select) (struct dirent64 *);
int (* Compare)(void *, void *);
int alphasort64 ( Directory1, Directory2)
void *Directory1, *Directory2;
```

Description

The **scandir** subroutine reads the directory pointed to by the *DirectoryName* parameter, and then uses the malloc subroutine to create an array of pointers to directory entries. The scandir subroutine returns the number of entries in the array and, through the NameList parameter, a pointer to the array.

The Select parameter points to a user-supplied subroutine that is called by the **scandir** subroutine to select which entries to include in the array. The selection routine is passed a pointer to a directory entry and should return a nonzero value for a directory entry that is included in the array. If the Select parameter is a null value, all directory entries are included.

The Compare parameter points to a user-supplied subroutine. This routine is passed to the qsort subroutine to sort the completed array. If the Compare parameter is a null value, the array is not sorted. The **alphasort** subroutine provides comparison functions for sorting alphabetically.

The memory allocated to the array can be deallocated by freeing each pointer in the array, and the array itself, with the free subroutine.

The alphasort subroutine treats *Directory1* and *Directory2* as pointers to **dirent** pointers and alphabetically compares them. This subroutine can be passed as the Compare parameter to either the scandir subroutine or the **qsort** subroutine, or a user-supplied subroutine can be used.

The scandir64 subroutine is similar to the scandir subroutine except that it returns a pointer to a list of pointers to struct dirent64 rather than of struct dirent.

The alphasort64 subroutine treats *Directory1* and *Directory2* as pointers to dirent64 pointers and alphabetically compares them. This subroutine can be passed as the Compare parameter to the scandir64 subroutine, or a user-supplied subroutine can be used.

Parameters

DirectoryName Points to the directory name.

NameList Points to the array of pointers to directory entries.

Select Points to a user-supplied subroutine that is called by the scandir

subroutine to select which entries to include in the array.

Compare Points to a user-supplied subroutine that sorts the completed array.

Point to dirent structures for alphasort, or to dirent64 structures for

alphasort64.

Return Values

Directory1, Directory2

The **scandir** subroutine returns the value -1 if the directory cannot be opened for reading or if the **malloc** subroutine cannot allocate enough memory to hold all the data structures. If successful, the scandir subroutine returns the number of entries found.

The **alphasort** subroutine returns the following values:

Less than 0 The **dirent** structure pointed to by the *Directory1* parameter is lexically less than the

dirent structure pointed to by the Directory2 parameter.

0 The dirent structures pointed to by the Directory1 parameter and the Directory2

parameter are equal.

Greater than 0 The dirent structure pointed to by the Directory1 parameter is lexically greater than the

dirent structure pointed to by the Directory2 parameter.

The scandir64 and alphasort64 subroutines return the similar values as scandir and alphasort subroutines, except that returned pointers associated with a dirent structure are now associated with a dirent64 structure.

Related Information

The malloc, free, realloc, calloc, mallopt, mallinfo, or alloca subroutine, opendir, readdir, telldir, seekdir, rewinddir, closedir, opendir64, readdir64, telldir64, seekdir64, rewinddir64, or closedir64 subroutine, **qsort** ("qsort Subroutine" on page 1) subroutine.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scanf, fscanf, sscanf, or wsscanf Subroutine

Purpose

Converts formatted input.

Library

```
Standard C Library (libc.a)
```

Syntax

or (libc128.a)

```
#include <stdio.h>
int scanf (Format [, Pointer, ... ])
const char *Format;
int fscanf (Stream, Format [, Pointer, ... ])
FILE * Stream;
const char *Format;
int sscanf (String, Format [, Pointer, ... ])
const char * String, *Format;
```

```
int wsscanf (wcs, Format [, Pointer, ... ])
const wchar t * wcs
const char *Format;
```

Description

The scanf, fscanf, sscanf, and wsscanf subroutines read character data, interpret it according to a format, and store the converted results into specified memory locations. If the subroutine receives insufficient arguments for the format, the results are unreliable. If the format is exhausted while arguments remain, the subroutine evaluates the excess arguments but otherwise ignores them.

These subroutines read their input from the following sources:

scanf Reads from standard input (stdin). fscanf Reads from the Stream parameter.

Reads from the character string specified by the *String* parameter. sscanf wsscanf Reads from the wide character string specified by the wcs parameter.

The scanf, fscanf, sscanf, and wsscanf subroutines can detect a language-dependent radix character, defined in the program's locale (LC_NUMERIC), in the input string. In the C locale, or in a locale that does not define the radix character, the default radix character is a full stop. (period).

Parameters

wcs Specifies the wide-character string to be read.

Specifies the input stream. Stream Specifies input to be read. String

Pointer Specifies where to store the interpreted data.

Format Contains conversion specifications used to interpret the input. If there are insufficient arguments for the Format parameter, the results are unreliable. If the Format parameter is exhausted while arguments remain, the excess arguments are evaluated as always but are otherwise ignored.

The *Format* parameter can contain the following:

- · Space characters (blank, tab, new-line, vertical-tab, or form-feed characters) that, except in the following two cases, read the input up to the next nonwhite space character. Unless a match in the control string exists, trailing white space (including a new-line character) is not read.
- Any character except a % (percent sign), which must match the next character of the input stream.
- · A conversion specification that directs the conversion of the next input field. The conversion specification consists of the following:
 - The % (percent sign) or the character sequence %*n*\$.

The %n\$ character sequence is an X/Open numbered argument specifier. Guidelines for use of the %n% specifier are:

- The value of n in n must be a decimal number without leading 0's and must be in the range from 1 to the NL_ARGMAX value, inclusive. See the limits.h file for more information about the **NL_ARGMAX** value. Using leading 0's (octal numbers) or a larger n value can have unpredictable results.
- Mixing numbered and unnumbered argument specifications in a format string can have unpredictable results. The only exceptions are %% (two percent signs) and %* (percent sign, asterisk), which can be mixed with the %n\$ form.
- Referencing numbered arguments in the argument list from the format string more than once can have unpredictable results.
- The optional assignment-suppression character * (asterisk).
- An optional decimal integer that specifies the maximum field width.
- An optional character that sets the size of the receiving variable for some flags. Use the following optional characters:
 - ı Long integer rather than an integer when preceding the d, i, or n conversion codes; unsigned long integer rather than unsigned integer when preceding the o, u, or x conversion codes; double rather than float when preceding the e, f, or g conversion codes.
 - Ш Long long integer rather than an integer when preceding the d, i, or n conversion codes; unsigned long long integer rather than unsigned integer when preceding the o, u, or x conversion codes.
 - L A long double rather than a float, when preceding the e.f. or a conversion codes; long integer rather than an integer when preceding the d, i, or n conversion codes; unsigned long integer rather than unsigned integer when preceding the o, u, or x conversion codes.
 - A short integer rather than an integer when preceding the **d**, **i**, and **n** conversion codes; an h unsigned short integer (half integer) rather than an unsigned integer when preceding the o, u, or x conversion codes.
 - Н _Decimal32 rather than a float, when preceding the e, E, f, F, g, or G conversion codes.
 - D Decimal64 rather than a float, when preceding the e, E, f, F, q, or G conversion codes.
 - DD _Decimal128 rather than a float, when preceding the e, E, f, F, g, or G conversion codes.

(cont.)

- An optional character that sets the size of the receiving variable for vector data types. Use the following optional characters:
 - vector float (four 4-byte float components) when preceding the e, E, f, g, G, a, or A conversion codes; vector signed char (sixteen 1-byte char components) when preceding the c, d, or i conversion codes; vector unsigned char when preceding the o, u, x, or X conversion codes.
 - vI or Iv vector signed integer (four 4-byte integer components) when preceding the d or i conversion codes; vector unsigned integer when preceding the o, u, x, or X conversion codes.

vh or hv

vector signed short (eight 2-byte integer components) when preceding the d or i conversion codes; vector unsigned short when preceding the o, u, x, or X conversion codes.

For any of the preceding specifiers, an optional separator character can be specified immediately preceding the vector size specifier. If no separator is specified, the default separator is a space unless the conversion is c, in which case the default separator is null. The set of supported optional separators are, (comma), ; (semicolon), : (colon), and (underscore).

A conversion code that specifies the type of conversion to be applied.

The conversion specification takes the form:

%[*][width][size]convcode

The results from the conversion are placed in the memory location designated by the *Pointer* parameter unless you specify assignment suppression with an * (asterisk). Assignment suppression provides a way to describe an input field to be skipped. The input field is a string of nonwhite space characters. It extends to the next inappropriate character or until the field width, if specified, is exhausted.

The conversion code indicates how to interpret the input field. The corresponding *Pointer* parameter must be a restricted type. Do not specify the Pointer parameter for a suppressed field. You can use the following conversion codes:

- % Accepts a single % (percent sign) input at this point; no assignment or conversion is done. The complete conversion specification should be %% (two percent signs).
- d Accepts an optionally signed decimal integer with the same format as that expected for the subject sequence of the strtol subroutine with a value of 10 for the base parameter. If no size modifier is specified, the *Pointer* parameter should be a pointer to an integer.
- i Accepts an optionally signed integer with the same format as that expected for the subject sequence of the strtol subroutine with a value of 0 for the base parameter. If no size modifier is specified, the *Pointer* parameter should be a pointer to an integer.
- u Accepts an optionally signed decimal integer with the same format as that expected for the subject sequence of the strtoul subroutine with a value of 10 for the base parameter. If no size modifier is specified, the *Pointer* parameter should be a pointer to an unsigned integer.
- Accepts an optionally signed octal integer with the same format as that expected for the subject 0 sequence of the strtoul subroutine with a value of 8 for the base parameter. If no size modifier is specified, the *Pointer* parameter should be a pointer to an unsigned integer.
- Accepts an optionally signed hexadecimal integer with the same format as that expected for the Х subject sequence of the strtoul subroutine with a value of 16 for the base parameter. If no size modifier is specified, the *Pointer* parameter should be a pointer to an integer.

e, f, or g

Accepts an optionally signed floating-point number with the same format as that expected for the subject sequence of the strtod subroutine. The next field is converted accordingly and stored

through the corresponding parameter; if no size modifier is specified, this parameter should be a pointer to a float. The input format for floating-point numbers is a string of digits, with some optional characteristics:

- It can be a signed value.
- · It can be an exponential value, containing a decimal rational number followed by an exponent field, which consists of an **E** or an **e** followed by an (optionally signed) integer.
- · It can be one of the special values INF, NaNQ, or NaNS. This value is translated into the IEEE-754 value for infinity, quiet NaN, or signaling NaN, respectively.
- р Matches an unsigned hexadecimal integer, the same as the %p conversion of the printf subroutine. The corresponding parameter is a pointer to a void pointer. If the input item is a value converted earlier during the same program execution, the resulting pointer compares equal to that value; otherwise, the results of the %p conversion are unpredictable.
- Consumes no input. The corresponding parameter is a pointer to an integer into which the scanf, n fscanf, sscanf, or wsscanf subroutine writes the number of characters (including wide characters) read from the input stream. The assignment count returned at the completion of this function is not incremented.
- S Accepts a sequence of nonwhite space characters (scanf, fscanf, and sscanf subroutines). The wsscanf subroutine accepts a sequence of nonwhite-space wide-character codes; this sequence is converted to a sequence of characters in the same manner as the wcstombs subroutine. The Pointer parameter should be a pointer to the initial byte of a char, signed char, or unsigned char array large enough to hold the sequence and a terminating null-character code, which is automatically added.
- S Accepts a sequence of nonwhite space characters (scanf, fscanf, and sscanf subroutines). This sequence is converted to a sequence of wide-character codes in the same manner as the mbstowcs subroutine. The wsscanf subroutine accepts a sequence of nonwhite-space wide character codes. The *Pointer* parameter should be a pointer to the initial wide character code of an array large enough to accept the sequence and a terminating null wide character code, which is automatically added. If the field width is specified, it denotes the maximum number of characters to accept.
- С Accepts a sequence of bytes of the number specified by the field width (scanf, fscanf and sscanf subroutines); if no field width is specified, 1 is the default. The wsscanf subroutine accepts a sequence of wide-character codes of the number specified by the field width; if no field width is specified, 1 is the default. The sequence is converted to a sequence of characters in the same manner as the wcstombs subroutine. The Pointer parameter should be a pointer to the initial bytes of an array large enough to hold the sequence; no null byte is added. The normal skip over white space does not occur.
- C Accepts a sequence of characters of the number specified by the field width (scanf, fscanf, and sscanf subroutines); if no field width is specified, 1 is the default. The sequence is converted to a sequence of wide character codes in the same manner as the mbstowcs subroutine. The wsscanf subroutine accepts a sequence of wide-character codes of the number specified by the field width; if no field width is specified, 1 is the default. The Pointer parameter should be a pointer to the initial wide character code of an array large enough to hold the sequence; no null wide-character code is added.

[scanset]

Accepts a nonempty sequence of bytes from a set of expected bytes specified by the scanset variable (scanf, fscanf, and sscanf subroutines). The wsscanf subroutine accepts a nonempty sequence of wide-character codes from a set of expected wide-character codes specified by the scanset variable. The sequence is converted to a sequence of characters in the same manner as the wcstombs subroutine. The *Pointer* parameter should be a pointer to the initial character of a char, signed char, or unsigned char array large enough to hold the sequence and a terminating null byte, which is automatically added. In the scanf, fscanf, and sscanf subroutines, the conversion specification includes all subsequent bytes in the string specified by the Format

parameter, up to and including the] (right bracket). The bytes between the brackets comprise the scanset variable, unless the byte after the [(left bracket) is a ^ (circumflex). In this case, the scanset variable contains all bytes that do not appear in the scanlist between the ^ (circumflex) and the] (right bracket). In the wsscanf subroutine, the characters between the brackets are first converted to wide character codes in the same manner as the mbtowc subroutine. These wide character codes are then used as described above in place of the bytes in the scanlist. If the conversion specification begins with [] or [^], the right bracket is included in the scanlist and the next right bracket is the matching right bracket that ends the conversion specification. You can also:

- Represent a range of characters by the construct First-Last. Thus, you can express [0123456789] as [0-9]. The First parameter must be lexically less than or equal to the Last parameter or else the - (dash) stands for itself. The - also stands for itself whenever it is the first or the last character in the scanset variable.
- Include the 1 (right bracket) as an element of the scanset variable if it is the first character of the scanset. In this case it is not interpreted as the bracket that closes the scanset variable. If the scanset variable is an exclusive scanset variable, the 1 is preceded by the ^ (circumflex) to make the 1 an element of the scanset. The corresponding Pointer parameter should point to a character array large enough to hold the data field and that ends with a null character (\0). The \0 is added automatically.

A scanf conversion ends at the end-of-file (EOF character), the end of the control string, or when an input character conflicts with the control string. If it ends with an input character conflict, the conflicting character is not read from the input stream.

Unless a match in the control string exists, trailing white space (including a new-line character) is not read.

The success of literal matches and suppressed assignments is not directly determinable.

The National Language Support (NLS) extensions to the scanf subroutines can handle a format string that enables the system to process elements of the argument list in variable order. The normal conversion character % is replaced by %n\$, where n is a decimal number. Conversions are then applied to the specified argument (that is, the nth argument), rather than to the next unused argument.

The first successful run of the fgetc, fgets, fread, getc, getchar, gets, scanf, or fscanf subroutine using a stream that returns data not supplied by a prior call to the unget ("unget or ungetwo Subroutine" on page 494) subroutine marks the st atime field for update.

Return Values

These subroutines return the number of successfully matched and assigned input items. This number can be 0 if an early conflict existed between an input character and the control string. If the input ends before the first conflict or conversion, only EOF is returned. If a read error occurs, the error indicator for the stream is set, EOF is returned, and the errno global variable is set to indicate the error.

Error Codes

The scanf, fscanf, sscanf, and wsscanf subroutines are unsuccessful if either the file specified by the Stream, String, or wcs parameter is unbuffered or data needs to be read into the file's buffer and one or more of the following conditions is true:

EAGAIN The O_NONBLOCK flag is set for the file descriptor underlying the file specified by the Stream, String, or wcs parameter, and the process would be delayed in the scanf, fscanf, or wsscanf operation.

EBADF The file descriptor underlying the file specified by the Stream, String, or wcs parameter is not a valid file

descriptor open for reading.

EINTR The read operation was terminated due to receipt of a signal, and either no data was transferred or a partial transfer was not reported.

Note: Depending upon which library routine the application binds to, this subroutine may return **EINTR**. Refer to the **signal** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine regarding SA_RESTART.

EIO The process is a member of a background process group attempting to perform a read from its

controlling terminal, and either the process is ignoring or blocking the SIGTTIN signal or the process

group has no parent process.

EINVAL The subroutine received insufficient arguments for the *Format* parameter.

A character sequence that is not valid was detected, or a wide-character code does not correspond to a **EILSEQ**

valid character.

ENOMEM Insufficient storage space is available.

National Language Support Overview for Programming in AIX 5L Version 5.3 National Language Support Guide and Reference.

sched_get_priority_max and sched_get_priority_min Subroutine

Purpose

Retrieves priority limits.

Library

Standard C Library (libc.a)

Syntax

```
#include <sched.h>
int sched_get_priority_max (policy)
int policy;
int sched get priority min (policy)
int policy;
```

Description

The sched_get_priority_max and sched_get_priority_min subroutines return the appropriate maximum or minimum, respectively, for the scheduling policy specified by the policy parameter.

The value of the *policy* parameter is one of the scheduling policy values defined in the **sched.h** header file.

Parameters

policy Specifies the scheduling policy.

Return Values

If successful, the sched_get_priority_max and sched_get_priority_min subroutines return the appropriate maximum or minimum values, respectively. If unsuccessful, they return -1 and set errno to indicate the error.

Error Codes

The sched_get_priority_max and sched_get_priority_min subroutines fail if:

The value of the policy parameter does not represent a defined scheduling policy. **EINVAL**

ENOTSUP This interface does not support processes capable of checkpoint.

Related Information

"sched_getparam Subroutine," "sched_getscheduler Subroutine" on page 140, "sched_rr_get_interval Subroutine" on page 141, and "sched_setscheduler Subroutine" on page 143.

sched_getparam Subroutine

Purpose

Gets scheduling parameters.

Library

Standard C Library (libc.a)

Syntax

#include <sched.h>

int sched getparam (pid, param) pit t pid; struct sched param *param;

Description

The sched_getparam subroutine returns the scheduling parameters of a process specified by the pid parameter in the **sched** param structure.

If a process specified by the pid parameter exists, and if the calling process has permission, the scheduling parameters for the process whose process ID is equal to the value of the pid parameter are returned.

If the pid parameter is zero, the scheduling parameters for the calling process are returned.

Parameters

pid Specifies the process for which the scheduling parameters are retrieved.

Points to the **sched_param** structure. param

Return Values

Upon successful completion, the sched getparam subroutine returns zero. If the sched getparam subroutine is unsuccessful, -1 is returned and errno is set to indicate the error.

Error Codes

The **sched_rr_get_interval** subroutine fails if:

EINVAL The param parameter is null or a bad address.

ENOTSUP This interface does not support processes capable of checkpoint.

EPERM The requesting process does not have permission to obtain the scheduling parameters of the

specified process.

ESRCH The pid parameter is negative, or no process can be found that corresponds to the one specified by

the pid parameter.

sched_getscheduler Subroutine

Purpose

Gets the scheduling policy.

Library

Standard C Library (libc.a)

Syntax

#include <sched.h>

int sched_getscheduler (pid) pid_t pid;

Description

The sched getscheduler subroutine returns the scheduling policy of the process specified by the pid parameter.

The values that can be returned by the sched_getscheduler subroutine are defined in the sched.h header file.

Parameters

Specifies the process for which the scheduling policy is retrieved. pid

Return Values

Upon successful completion, the sched_getscheduler subroutine returns the scheduling policy of the specified process. If unsuccessful it returns -1 and sets errno to indicate the error.

Error Codes

The **sched getscheduler** subroutine fails if:

EPERM The requesting process does not have permission to determine the scheduling policy of the

specified process.

ESRCH The pid parameter is negative, or no process can be found that corresponds to the one specified

by the *pid* parameter.

ENOTSUP This interface does not support processes capable of checkpoint.

"sched_getparam Subroutine" on page 139 and "sched_setscheduler Subroutine" on page 143.

sched rr get interval Subroutine

Purpose

Gets the execution time limits.

Library

Standard C Library (libc.a)

Syntax

#include <sched.h> int sched rr get interval (pid, interval) pid t pid; struct timespec *interval;

Description

The sched_rr_get_interval subroutine updates the timespec structure referenced by the interval parameter to contain the current execution time limit for the process specified by the pid parameter.

The current execution time limit applies to process made of system-scope pthreads only, and it is the value of the timeslice tunable for the process specified.

If value of the pid parameter is zero, the current execution time limit for the calling process is returned.

Parameters

pid Specifies the process for which the current execution time limit is retrieved.

interval Points to the **timespec** structure to be updated.

Return Values

If successful, the sched_rr_get_interval subroutine returns zero. Otherwise, it returns -1 and sets errno to indicate the error.

Error Codes

The **sched_rr_get_interval** subroutine fails if:

EINVAL The param parameter is null or a bad address.

ENOTSUP This interface does not support processes capable of checkpoint.

ESRCH The pid parameter is negative, or no process can be found that corresponds to the one specified by

the pid parameter.

Related Information

"sched_getparam Subroutine" on page 139, "sched_get_priority_max and sched_get_priority_min Subroutine" on page 138, "sched_getscheduler Subroutine" on page 140, "sched_setparam Subroutine" on page 142, and "sched_setscheduler Subroutine" on page 143.

sched_setparam Subroutine

Purpose

Sets scheduling parameters.

Library

Standard C Library (libc.a)

Syntax

#include <sched.h>

int sched setparam (pid, param) pid t pid; const struct sched param *param;

Description

The **sched** setparam subroutine sets the scheduling parameters of the process specified by the pid parameter to the values specified by the **sched_param** structure pointed to by the *param* parameter. The value of the sched priority member in the sched param structure is any integer within the inclusive priority range for the current scheduling policy. Higher numerical values for the priority represent higher priorities.

If a process specified by the pid parameter exists, and if the calling process has permission, the scheduling parameters are set for the process whose process ID is equal to the value of the pid parameter.

If the pid parameter is zero, the scheduling parameters are set for the calling process.

If the caller is favoring a process, it must have SET_PROC_RAC authority. The caller should have the same effective or real user id or BYPASS_DAC_WRITE authority to modify the priority of the process.

Implementations may require the requesting process to have the appropriate authority to set its own scheduling parameters or those of another process.

The target process, whether it is running or not running, is moved to the end of the thread list for its priority.

If the priority of the process specified by the pid parameter is set higher than that of the lowest priority running process and if the specified process is ready to run, the process specified by the pid parameter preempts the lowest priority running process. Similarly, if the process calling the sched_setparam subroutine sets its own priority lower than that of one or more other non-empty process lists, the process that is the head of the highest priority list also preempts the calling process. Thus, the originating process might not receive notification of the completion of the requested priority change until the higher priority process has executed.

Other scheduling policies (such as, SCHED_FIFO2, SCHED_FIFO3, SCHED_FIFO4) behave like fixed priority scheduling policies (such as, SCHED_FIFO and SCHED_RR).

The effect of the **sched setparam** subroutine on individual threads is dependent on the scheduling contention scope of the threads:

• The sched setparam subroutine has no effect on the scheduling of threads with system scheduling contention scope.

 For threads with process scheduling contention scope, the threads' scheduling parameters are not affected. However, the scheduling of these threads with respect to threads in other processes may be dependent on the scheduling parameters of their process, which are governed using the sched_setparam subroutine.

If an implementation supports a two-level scheduling model in which library threads are multiplexed on top of several kernel-scheduled entities, the underlying kernel-scheduled entities for the system contention scope threads are not affected by the **sched_setparam** subroutine.

The underlying kernel-scheduled entities for the process contention scope threads will have their scheduling parameters changed to the value specified in the param parameter. Kernel-scheduled entities for use by process contention scope threads created after this call completes inherit their scheduling policy and associated scheduling parameters from the process.

The **sched_setparam** subroutine is not atomic with respect to other threads in the process. Threads might continue to execute while this subroutine call is in the process of changing the scheduling policy for the underlying kernel-scheduled entities.

Parameters

pid Specifies the process for which the scheduling parameter is set.

param Points to the **sched_param** structure.

Return Values

If successful, the **sched_setparam** subroutine returns zero.

If the sched_setparam subroutine is unsuccessful, the priority remains unchanged, and the subroutine returns a value of -1 and sets errno to indicate the error.

Error Codes

The **sched_setparam** subroutine fails if:

EINVAL One or more of the requested scheduling parameters is outside the range defined for the

scheduling policy of the specified process ID.

EINVAL The param parameter is null or a bad address

ENOTSUP This interface does not support processes capable of checkpoint.

The requesting process does not have permission to set the scheduling parameters for the **EPERM**

specified process, or does not have the appropriate authority to invoke the sched_setparam

subroutine.

ESRCH The pid parameter is negative, or no process can be found that corresponds to the one specified

by the pid parameter.

"sched_getparam Subroutine" on page 139, "sched_getscheduler Subroutine" on page 140, and "sched setscheduler Subroutine."

sched setscheduler Subroutine

Purpose

Sets the scheduling policy and parameters.

Library

Standard C Library (libc.a)

Syntax

```
#include <sched.h>
int sched setscheduler (pid, policy, param)
pid_t pid;
int policy;
const struct sched_param *param;
```

Description

The sched setscheduler subroutine sets the scheduling policy and scheduling parameters of the process specified by the pid parameter to the policy parameter and the parameters specified in the sched param structure pointed to by param, respectively. The value of the sched priority member in the sched param structure is any integer within the inclusive priority range for the scheduling policy.

The possible values for the *policy* parameter are defined in the **sched.h** header file.

If a process specified by the pid parameter exists, and if the calling process has permission, the scheduling policy and scheduling parameters are set for the process.

If the pid parameter is zero, the scheduling policy and scheduling parameters are set for the calling process.

In order to change a scheduling policy to a fixed priority scheduling policy, the caller must have SET_PROC_RAC authority. When changing the scheduling policy to the SCHED_OTHER scheduling policy, if the former policy was not SCHED_OTHER, the caller must have SET_PROC_RAC authority.

SET_PROC_RAC authority is not needed if the caller wants to defavor a process under the following conditions:

- The former_policy process was SCHED_OTHER.
- The new policy is still SCHED_OTHER.
- The new priority is lower than the old priority (the caller wants to defavor the process).
- All the impacted user process-scope threads have a SCHED OTHER policy.
- The caller should have the same effective or real user id or BYPASS_DAC_WRITE authority.

The sched setscheduler subroutine is successful if it succeeds in setting the scheduling policy and scheduling parameters of the process specified by pid to the values specified by the policy parameter and the structure pointed to by the param parameter, respectively.

The effect of this subroutine on individual threads is dependent on the scheduling contention scope of the following threads:

- The sched_setscheduler subroutine has no effect on threads with system scheduling contention
- · For threads with process scheduling contention scope, the threads' scheduling policy and associated parameters are not affected. However, the scheduling of these threads with respect to threads in other processes might be dependent on the scheduling parameters of their process, which are governed using the **sched setscheduler** subroutine.

If an implementation supports a two-level scheduling model in which library threads are multiplexed on top of several kernel-scheduled entities, the underlying kernel-scheduled entities for the system contention scope threads are not affected by these subroutines.

The underlying kernel-scheduled entities for the process contention scope threads have their scheduling policy and associated scheduling parameters changed to the values specified in the policy and param parameters, respectively. Kernel-scheduled entities for use by process contention scope threads that are created after this call completes inherit their scheduling policy and associated scheduling parameters from the process.

This subroutine is not atomic with respect to other threads in the process. Threads may continue to execute while this subroutine is in the process of changing the scheduling policy and associated scheduling parameters for the underlying kernel-scheduled entities used by the process contention scope threads.

Parameters

pid Specifies the process for which the scheduling policy and parameters are set.

Contains the scheduling policy and scheduling parameters settings. policy

Points to the **sched_param** structure. param

Return Values

Upon successful completion, the sched_setscheduler subroutine returns the former scheduling policy of the specified process. If the sched_setscheduler subroutine fails to complete successfully, the policy and scheduling parameters will remain unchanged, and the subroutine returns -1 and sets errno to indicate the error.

Error Codes

The sched_setscheduler subroutine fails if:

EINVAL The param parameter is null or a bad address.

ENOTSUP This interface does not support processes capable of checkpoint.

The requesting process does not have permission to set either or both of the scheduling **EPERM**

parameters or the scheduling policy of the specified process.

ESRCH The pid parameter is negative, or no process can be found that corresponds to the one specified

by the pid parameter.

sched_yield Subroutine

Purpose

Yields the processor.

Library

Standard C Library (libc.a)

Syntax

#include <sched.h>

int sched yield (void);

Description

The sched_yield subroutine forces the running thread to relinquish the processor until it again becomes the head of its thread list. It takes no parameters.

Return Values

The sched_yield subroutine returns 0 if it completes successfully. Otherwise, it returns -1 and sets errno to indicate the error.

Error Codes

The **sched_yield** subroutine fails if:

ENOTSUP

This interface does not support processes capable of checkpoint.

select Subroutine

Purpose

Checks the I/O status of multiple file descriptors and message queues.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/time.h>
#include <sys/select.h>
#include <sys/types.h>
int select (Nfdsmsgs, ReadList, WriteList, ExceptList, TimeOut)
int Nfdsmsqs;
struct sellist * ReadList, *WriteList, *ExceptList;
struct timeval * TimeOut;
```

Description

The **select** subroutine checks the specified file descriptors and message queues to see if they are ready for reading (receiving) or writing (sending), or if they have an exceptional condition pending.

When selecting on an unconnected stream socket, select returns when the connection is made. If selecting on a connected stream socket, then the ready message indicates that data can be sent or received. Files descriptors of regular files always select true for read, write, and exception conditions. For more information on sockets, refer to "Understanding Socket Connections" and the related "Checking for Pending Connections Example Program" dealing with pending connections in AIX 5L Version 5.3 Communications Programming Concepts.

The **select** subroutine is also supported for compatibility with previous releases of this operating system and with BSD systems.

On shared memory descriptors, the **select** subroutine returns true.

Note: If selecting on a non-blocking socket for both read and write events and if the destination host is unreachable, **select** could show a different behavior due to timing constraints. Refer to the Examples section of this document for further information..

Parameters

Nfdsmsgs

Specifies the number of file descriptors and the number of message queues to check. The low-order 16 bits give the length of a bit mask that specifies which file descriptors to check; the high-order 16 bits give the size of an array that contains message queue identifiers. If either half of the Nfdsmsgs parameter is equal to a value of 0, the corresponding bit mask or array is assumed not to be present.

TimeOut

Specifies either a null pointer or a pointer to a timeval structure that specifies the maximum length of time to wait for at least one of the selection criteria to be met. The timeval structure is defined in the /usr/include/sys/time.h file and it contains the following members:

```
struct timeval {
                     /* seconds
  int tv sec;
  int tv usec;
                     /* microseconds */
   };
```

The number of microseconds specified in TimeOut.tv usec, a value from 0 to 999999, is set to one millisecond if the process does not have root user authority and the value is less than one millisecond.

If the *TimeOut* parameter is a null pointer, the **select** subroutine waits indefinitely, until at least one of the selection criteria is met. If the *TimeOut* parameter points to a **timeval** structure that contains zeros, the file and message queue status is polled, and the select subroutine returns immediately.

ReadList, WriteList, ExceptList

Specify what to check for reading, writing, and exceptions, respectively. Together, they specify the selection criteria. Each of these parameters points to a sellist structure, which can specify both file descriptors and message queues. Your program must define the sellist structure in the following form:

```
struct sellist
ulong fdsmask[F];
                           /* file descriptor bit mask */
                     /* Tile descripto. 2.1.
/* message queue identifiers */
int msgids[M];
};
```

The fdsmask array is treated as a bit string in which each bit corresponds to a file descriptor. File descriptor n is represented by the bit(1 << $(n \mod bits)$) in the array element fdsmask[n / BITS(int)]. (The BITS macro is defined in the values.h file.) Each bit that is set to 1 indicates that the status of the corresponding file descriptor is to be checked. Note: The low-order 16 bits of the Nfdsmsgs parameter specify the number of bits (not elements) in the fdsmask array that make up the file descriptor mask. If only part of the last int is included in the mask, the appropriate number of low-order bits are used, and the remaining high-order bits are ignored. If you set the low-order 16 bits of the Nfdsmsgs parameter to 0, you must not define an fdsmask array in the sellist structure.

Each int of the msgids array specifies a message queue identifier whose status is to be checked. Elements with a value of -1 are ignored. The high-order 16 bits of the Nfdsmsgs parameter specify the number of elements in the msgids array. If you set the high-order 16 bits of the Nfdsmsgs parameter to 0, you must not define a msgids array in the sellist structure.

Note: The arrays specified by the ReadList, WriteList, and ExceptList parameters are the same size because each of these parameters points to the same **sellist** structure type. However, you need not specify the same number of file descriptors or message queues in each. Set the file descriptor bits that are not of interest to 0, and set the extra elements of the msgids array to -1.

You can use the SELLIST macro defined in the sys/select.h file to define the sellist structure. The format of this macro is:

```
SELLIST(f, m) declarator . . . ;
```

where f specifies the size of the fdsmask array, m specifies the size of the msgids array, and each declarator is the name of a variable to be declared as having this type.

Return Values

Upon successful completion, the select subroutine returns a value that indicates the total number of file descriptors and message queues that satisfy the selection criteria. The fdsmask bit masks are modified so that bits set to 1 indicate file descriptors that meet the criteria. The msqids arrays are altered so that message queue identifiers that do not meet the criteria are replaced with a value of -1.

The return value is similar to the Nfdsmsgs parameter in that the low-order 16 bits give the number of file descriptors, and the high-order 16 bits give the number of message queue identifiers. These values indicate the sum total that meet each of the read, write, and exception criteria. Therefore, the same file descriptor or message queue can be counted up to three times. You can use the NFDS and NMSGS macros found in the sys/select.h file to separate out these two values from the return value. For example, if rc contains the value returned from the **select** subroutine, **NFDS**(rc) is the number of files selected, and **NMSGS**(*rc*) is the number of message gueues selected.

If the time limit specified by the *TimeOut* parameter expires, the **select** subroutine returns a value of 0.

If a connection-based socket is specified in the Readlist parameter and the connection disconnects, the select subroutine returns successfully, but the recv subroutine on the socket will return a value of 0 to indicate the socket connection has been closed.

For nonbloking connection-based sockets, both successful and unsuccessful connections will cause the **select** subroutine to return successfully without any error.

When the connection completes successfully the socket becomes writable, and if the connection encounters an error the socket becomes both readable and writable.

When using the select subroutine, you can not check any pending errors on the socket. You need to call the getsockopt subroutine with SOL SOCKET and SOL ERROR to check for a pending error.

If the **select** subroutine is unsuccessful, it returns a value of -1 and sets the global variable **errno** to indicate the error. In this case, the contents of the structures pointed to by the ReadList, WriteList, and ExceptList parameters are unpredictable.

Error Codes

The **select** subroutine is unsuccessful if one of the following are true:

EBADF An invalid file descriptor or message queue identifier was specified.

EAGAIN Allocation of internal data structures was unsuccessful.

EINTR A signal was caught during the select subroutine and the signal handler was installed with an

indication that subroutines are not to be restarted.

EINVAL An invalid value was specified for the *TimeOut* parameter or the *Nfdsmsgs* parameter. **EINVAL** The STREAM or multiplexer referenced by one of the file descriptors is linked (directly or

indirectly) downstream from a multiplexer.

EFAULT The ReadList, WriteList, ExceptList, or TimeOut parameter points to a location outside of the

address space of the process.

Examples

The following is an example of the behavior of the select subroutine called on a non-blocking socket, when trying to connect to a host that is unreachable:

```
#include <sys/types.h>
#include <sys/socket.h>
#include <netinet/in.h>
#include <netinet/tcp.h>
#include <fcntl.h>
#include <sys/time.h>
```

```
#include <errno.h>
#include <stdio.h>
int main()
    int sockfd, cnt, i = 1;
    struct sockaddr in serv addr;
    bzero((char *)&serv_addr, sizeof (serv_addr));
    serv_addr.sin_family = AF_INET;
    serv addr.sin addr.s addr = inet addr("172.16.55.25");
    serv addr.sin port = htons(102);
    if ((sockfd = socket(AF_INET, SOCK_STREAM, 0)) < 0)</pre>
        exit(1);
    if (fcntl(sockfd, F SETFL, FNONBLOCK) < 0)
        exit(1);
    if (connect(sockfd, (struct sockaddr *)&serv addr, sizeof
            (serv addr)) < 0 && errno != EINPROGRESS)</pre>
        exit(1);
    for (cnt=0; cnt<2; cnt++) {
        fd set readfds, writefds;
        FD ZERO(&readfds);
        FD SET(sockfd, &readfds);
        FD ZERO(&writefds);
        FD_SET(sockfd, &writefds);
        if (select(sockfd + 1, &readfds, &writefds, NULL,
                NULL) < 0)
            exit(1);
        printf("Iteration %d =======\n". i);
        printf("FD ISSET(sockfd, &readfds) == %d\n",
            FD ISSET(sockfd, &readfds));
        printf("FD_ISSET(sockfd, &writefds) == %d\n",
            FD_ISSET(sockfd, &writefds));
    return 0;
Here is the output of the above program:
Iteration 1 ========
FD ISSET(sockfd, &readfds) == 0
FD ISSET(sockfd, &writefds) == 1
Iteration 2 =======
FD ISSET(sockfd, &readfds) == 1
FD_ISSET(sockfd, &writefds) == 1
```

In the first iteration, **select** notifies the write event only. In the second iteration, **select** notifies both the read and write events.

Notes

FD_SETSIZE is the #define variable that defines how many file descriptors the various FD macros will use. The default value for **FD_SETSIZE** will vary, depending on the version of AIX. As the number of open files supported has increased, the default value of **FD_SETSIZE** has increased.

In AIX 4.3.1, the size increased to 32767 open file descriptors (from 2000 in prior releases). In AIX 5.2, the size increased to 65534 open file descriptors. This value can not be set greater than **OPEN_MAX**, which also varies from one AIX Version to another.

For more information, refer to the /usr/include/sys/time.h file.

The user may override **FD SETSIZE** to select a smaller value before including the system header files. This is desirable for performance reasons, because of the overhead in FD ZERO to zero 65534 bits.

Performance Issues and Recommended Coding Practices

The select subroutine can be a very compute intensive system call, depending on the number of open file descriptors used and the lengths of the bit maps used. Do not follow the examples shown in many text books. Most were written when the number of open files supported was small, and thus the bit maps were short. You should avoid the following (where select is being passed FD SETSIZE as the number of FDs to process):

```
select(FD SETSIZE, ....)
```

Performance will be poor if the program uses FD_ZERO and the default FD_SETSIZE. FD_ZERO should not be used in any loops or before each select call. However, using it one time to zero the bit string will not cause problems. If you plan to use this simple programming method, you should override FD SETSIZE to define a smaller number of FDs. For example, if your process will only open two FDs that you will be selecting on, and there will never be more than a few hundred other FDs open in the process, you should lower FD_SETSIZE to approximately 1024.

Do not pass FD_SETSIZE as the first parameter to select. This specifies the maximum number of file descriptors the system should check for. The program should keep track of the highest FD that has been assigned or use the **getdtablesize** subroutine to determine this value. This saves passing excessively long bit maps in and out of the kernel and reduces the number of FDs that **select** must check.

Use the poll system call instead of select. The poll system call has the same functionality as select, but it uses a list of FDs instead of a bit map. Thus, if you are only selecting on a single FD, you would only pass one FD to poll. With select, you have to pass a bit map that is as long as the FD number assigned for that FD. If AIX assigned FD 4000, for example, you would have to pass a bit map 4001 bits long.

Related Information

The poll subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sem close Subroutine

Purpose

Closes a named semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h> int sem_close (sem) sem_t *sem;

Description

The **sem** close subroutine indicates that the calling process is finished using the named semaphore indicated by the sem parameter. Calling sem close for an unnamed semaphore (one created by sem_init) returns an error. The sem_close subroutine deallocates (that is, makes available for reuse by a subsequent calls to the sem open subroutine) any system resources allocated by the system. If the

process attempts subsequent uses of the semaphore pointed to by sem, an error is returned. If the semaphore has not been removed with a successful call to the sem unlink subroutine, the sem close subroutine has no effect on the state of the semaphore. If the sem_unlink subroutine has been successfully invoked for the name parameter after the most recent call to sem_open with the O_CREAT flag set, when all processes that have opened the semaphore close it, the semaphore is no longer accessible.

Parameters

Indicates the semaphore to be closed. sem

Return Values

Upon successful completion, 0 is returned. Otherwise, -1 is returned and errno is set to indicate the error.

Error Codes

The sem close subroutine fails if:

EFAULT Invalid user address.

EINVAL The *sem* parameter is not a valid semaphore descriptor.

ENOMEM Insufficient memory for the required operation.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"sem init Subroutine" on page 153, "sem open Subroutine" on page 154, and "sem unlink Subroutine" on page 159.

sem_destroy Subroutine

Purpose

Destroys an unnamed semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h>

int sem destroy (sem) sem_t *sem;

Description

The **sem_destroy** subroutine destroys the unnamed semaphore indicated by the *sem* parameter. Only a semaphore that was created using the sem init subroutine can be destroyed using the sem destroy subroutine; calling sem_destroy with a named semaphore returns an error. Subsequent use of the semaphore sem returns an error until sem is reinitialized by another call to sem_init. It is safe to destroy an initialized semaphore upon which other threads are currently blocked.

Parameters

sem Indicates the semaphore to be closed.

Return Values

Upon successful completion, 0 is returned. Otherwise, -1 is returned and errno set to indicate the error.

Error Codes

The sem_destroy subroutine fails if:

EACCES Permission is denied to destroy the unnamed semaphore.

EFAULT Invalid user address.

EINVAL The *sem* parameter is not a valid semaphore.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"sem init Subroutine" on page 153, and "sem open Subroutine" on page 154.

sem getvalue Subroutine

Purpose

Gets the value of a semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h> int sem_getvalue (sem, sval) sem t *restrict sem;

Description

int *restrict sval;

The **sem getvalue** subroutine updates the location referenced by the *sval* parameter to have the value of the semaphore referenced by the sem parameter without affecting the state of the semaphore. The updated value represents an actual semaphore value that occurred at some unspecified time during the call, but it need not be the actual value of the semaphore when it is returned to the calling process.

If the sem parameter is locked, the object to which the sval parameter points is set to a negative number whose absolute value represents the number of processes waiting for the semaphore at an unspecified time during the call.

Parameters

sem Indicates the semaphore to be retrieved.

Specifies the location where the semaphore value is stored. sval

Return Values

Upon successful completion, the sem getvalue subroutine returns a 0. Otherwise, it returns a -1 and sets **errno** to indicate the error.

Error Codes

The sem_getvalue subroutine fails if:

EACCES Permission is denied to access the unnamed semaphore.

EFAULT Invalid user address.

EINVAL The *sem* parameter does not refer to a valid semaphore.

ENOMEM Insufficient memory for the required operation.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"sem open Subroutine" on page 154, "sem_post Subroutine" on page 156, and "sem_trywait and sem_wait Subroutine" on page 158.

sem_init Subroutine

Purpose

Initializes an unnamed semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h>

```
int sem init (sem, pshared, value)
sem_t *sem;
int pshared;
unsigned value;
```

Description

The **sem** init subroutine initializes the unnamed semaphore referred to by the *sem* parameter. The value of the initialized semaphore is contained in the value parameter. Following a successful call to the sem init subroutine, the semaphore might be used in subsequent calls to the sem wait, sem trywait, sem_post, and sem_destroy subroutines. This semaphore remains usable until it is destroyed.

If the pshared parameter has a nonzero value, the semaphore is shared between processes. In this case, any process that can access the sem parameter can use it for performing sem wait, sem trywait, sem post, and sem destroy operations.

Only the *sem* parameter itself may be used for performing synchronization.

If the pshared parameter is zero, the semaphore is shared between threads of the process. Any thread in this process can use the sem parameter for performing sem_wait, sem_trywait, sem_post, and sem destroy operations. The use of the semaphore by threads other than those created in the same process returns an error.

Attempting to initialize a semaphore that has been already initialized results in the loss of access to the previous semaphore.

Parameters

sem

Specifies the semaphore to be initialized.

pshared Determines whether the semaphore can be shared between processes or not.

Contains the value of the initialized semaphore. value

Return Values

Upon successful completion, the **sem init** subroutine initializes the semaphore in the *sem* parameter. Otherwise, it returns -1 and sets errno to indicate the error.

Error Codes

The sem init subroutine fails if:

EFAULT Invalid user address.

EINVAL The value parameter exceeds SEM VALUE MAX. **ENFILE** Too many semaphores are currently open in the system.

ENOMEM Insufficient memory for the required operation.

ENOSPC A resource required to initialize the semaphore has been exhausted, or the limit on semaphores,

SEM_NSEMS_MAX, has been reached.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

sem open Subroutine

Purpose

Initializes and opens a named semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h>

sem t * sem open (const char *name, int oflag, mode t mode, unsigned value)

Description

The sem_open subroutine establishes a connection between a named semaphore and a process. Following a call to the **sem_open** subroutine with semaphore name *name*, the process may reference the semaphore using the address returned from the call. This semaphore may be used in subsequent calls to the sem_wait, sem_trywait, sem_post, and sem_close subroutines. The semaphore remains usable by this process until the semaphore is closed by a successful call to sem close, exit, or one of the exec subroutines.

The name parameter points to a string naming a semaphore object. The name has no representation in the file system. The name parameter conforms to the construction rules for a pathname. It might begin with a slash character, and it must contain at least one character. Processes calling sem_open() with the same value of *name* refers to the same semaphore object, as long as that name has not been removed.

If a process makes multiple successful calls to the **sem open** subroutine with the same value of the *name* parameter, the same semaphore address is returned for each such successful call, provided that there have been no calls to the **sem_unlink** subroutine for this semaphore.

Parameters

oflag

Points to a string naming a semaphore object. name

Controls whether the semaphore is created or merely accessed by the call to the sem_open subroutine. The following flag bits may be set in the oflag parameter:

O CREAT

This flag is used to create a semaphore if it does not already exist. If the O_CREAT flag is set and the semaphore already exists, the O CREAT flag has no effect, except as noted under the description of the O EXCL flag. Otherwise, the sem open subroutine creates a named semaphore. The O_CREAT flag requires a third and a fourth parameter: mode, which is of type mode_t, and value, which is of type unsigned. The semaphore is created with an initial value of value. Valid initial values for semaphores are less than or equal to **SEM_VALUE_MAX**.

The user ID of the semaphore is set to the effective user ID of the process. The group ID of the semaphore is set to the effective group ID of the process. The permission bits of the semaphore are set to the value of the mode parameter except those set in the file mode creation mask of the process. When bits in mode other than file permission bits are set, they have no effect. When bits in mode other than file permission bits are set, they have no effect.

After the semaphore named name has been created by the sem open subroutine with the O_CREAT flag, other processes can connect to the semaphore by calling the **sem open** subroutine with the same value of *name*.

O EXCL

If the O EXCL and O CREAT flags are set, the sem open subroutine fails if the semaphore name exists. The check for the existence of the semaphore and the creation of the semaphore if it does not exist are atomic with respect to other processes executing the sem_open subroutine with the O_EXCL and O_CREAT flags set. If O EXCL is set and O CREAT is not set, O EXCL is ignored. If flags other than O CREAT and O EXCL are specified in the oflag parameter, they have no effect.

Specifies the value of the file permission bits. Used with O CREAT to create a message queue. mode Specifies the initial value. Used with **O CREAT** to create a message queue. value

Return Values

Upon successful completion, the **sem open** subroutine returns the address of the semaphore. Otherwise, it returns a value of SEM FAILED and sets errno to indicate the error. The SEM FAILED symbol is defined in the **semaphore.h** header file. No successful return from the **sem open** subroutine returns the value **SEM FAILED**.

Error Codes

If any of the following conditions occur, the sem_open subroutine returns SEM_FAILED and sets errno to the corresponding value:

EACCES The named semaphore exists and the permissions specified by oflag are denied. The O CREAT and O EXCL flags are set and the named semaphore already exists. **EEXIST**

EFAULT Invalid user address.

EINVAL The sem_open subroutine is not supported for the given name, or the O_CREAT flag was specified in the *oflag* parameter and *value* was greater than **SEM_VALUE_MAX**.

Too many semaphore descriptors are currently in use by this process.

EMFILE

The length of the *name* parameter exceeds **PATH_MAX**, or a pathname component is **ENAMETOOLONG**

longer than NAME_MAX.

ENFILE Too many semaphores are currently open in the system.

ENOENT The **O_CREAT** flag is not set and the named semaphore does not exist.

ENOMEM Insufficient memory for the required operation.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"semctl Subroutine" on page 160, "semget Subroutine" on page 163, "semop and semtimedop Subroutines" on page 165, "sem close Subroutine" on page 150, "sem getvalue Subroutine" on page 152, "sem_post Subroutine," "sem_trywait and sem_wait Subroutine" on page 158, and "sem_unlink Subroutine" on page 159.

sem_post Subroutine

Purpose

Unlocks a semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h> int sem post (sem) sem t *sem;

Description

The **sem** post subroutine unlocks the semaphore referenced by the sem parameter by performing a semaphore unlock operation on that semaphore.

If the semaphore value resulting from this operation is positive, no threads were blocked waiting for the semaphore to become unlocked, and the semaphore value is incremented.

If the value of the semaphore resulting from this operation is zero, one of the threads blocked waiting for the semaphore is allowed to return successfully from its call to the sem_wait subroutine. If the Process Scheduling option is supported, the thread to be unblocked is chosen in a manner appropriate to the scheduling policies and parameters in effect for the blocked threads. In the case of the schedulers SCHED FIFO and SCHED RR, the highest priority waiting thread shall be is unblocked, and if there is more than one highest priority thread blocked waiting for the semaphore, then the highest priority thread that has been waiting the longest is unblocked. If the Process Scheduling option is not defined, the choice of a thread to unblock is unspecified.

If the Process Sporadic Server option is supported, and the scheduling policy is SCHED_SPORADIC, the semantics are the same as SCHED_FIFO in the preceding paragraph.

The sem_post subroutine is reentrant with respect to signals and may be invoked from a signal-catching function.

Parameters

Specifies the semaphore to be unlocked. sem

Return Values

If successful, the sem post subroutine returns zero. Otherwise, it returns -1 and sets errno to indicate the error.

Error Codes

The **sem_post** subroutine fails if:

EACCES Permission is denied to access the unnamed semaphore.

EFAULT Invalid user address.

Semaphore was removed during the required operation. **EIDRM EINVAL** The *sem* parameter does not refer to a valid semaphore.

ENOMEM Insufficient memory for the required operation.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"sem_open Subroutine" on page 154 and "sem_trywait and sem_wait Subroutine" on page 158.

sem_timedwait Subroutine

Purpose

Locks a semaphore (ADVANCED REALTIME).

Syntax

```
#include <semaphore.h>
#include <time.h>
int sem timedwait(sem t *restrict sem,
       const struct timespec *restrict abs timeout);
```

Description

The sem_timedwait() function locks the semaphore referenced by sem as in the sem_wait() function. However, if the semaphore cannot be locked without waiting for another process or thread to unlock the semaphore by performing a sem_post() function, this wait terminates when the specified timeout expires.

The timeout expires when the absolute time specified by abs timeout passes—as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds abs_timeout)—or when the absolute time specified by abs timeout has already been passed at the time of the call.

If the Timers option is supported, the timeout is based on the CLOCK_REALTIME clock. If the Timers option is not supported, the timeout is based on the system clock as returned by the time() function. The resolution of the timeout matches the resolution of the clock on which it is based. The timespec data type is defined as a structure in the <time.h> header.

The function never fails with a timeout if the semaphore can be locked immediately. The validity of the abs timeout parameter does not need to be checked if the semaphore can be locked immediately.

Application Usage

The sem_timedwait() function is part of the Semaphores and Timeouts options and need not be provided on all implementations.

Return Values

The sem timedwait() function returns 0 if the calling process successfully performed the semaphore lock operation on the semaphore designated by sem. If the call was unsuccessful, the state of the semaphore remains unchanged, the function returns a value of -1, and errno is set to indicate the error.

Error Codes

The sem_timedwait() function fails if:

[EFAULT] abs_timeout references invalid memory.

[EINVAL] The sem argument does not refer to a valid semaphore.

The process or thread would have blocked, and the abs_timeout parameter specified [EINVAL]

a nanoseconds field value less than 0 or greater than or equal to 1000 million.

The semaphore could not be locked before the specified timeout expired. [ETIMEDOUT]

The sem_timedwait() function might fail if:

[EDEADLK] A deadlock condition was detected. [EINTR] A signal interrupted this function.

Related Information

"sem_post Subroutine" on page 156, "sem_trywait and sem_wait Subroutine," "semctl Subroutine" on page 160, "semget Subroutine" on page 163, "semop and semtimedop Subroutines" on page 165.

sem trywait and sem wait Subroutine

Purpose

Locks a semaphore.

Library

Standard C Library (libc.a)

Syntax

```
#include <semaphore.h>
int sem trywait (sem)
sem t *sem;
int sem wait (sem)
sem t *sem;
```

Description

The **sem_trywait** subroutine locks the semaphore referenced by the *sem* parameter only if the semaphore is currently not locked; that is, if the semaphore value is currently positive. Otherwise, it does not lock the semaphore.

The sem_wait subroutine locks the semaphore referenced by the sem parameter by performing a semaphore lock operation on that semaphore. If the semaphore value is currently zero, the calling thread does not return from the call to the sem wait subroutine until it either locks the semaphore or the call is interrupted by a signal.

Upon successful return, the state of the semaphore will be locked and will remain locked until the **sem post** subroutine is executed and returns successfully.

The **sem** wait subroutine is interruptible by the delivery of a signal.

Parameters

sem

Specifies the semaphore to be locked.

Return Values

The sem trywait and sem wait subroutines return zero if the calling process successfully performed the semaphore lock operation. If the call was unsuccessful, the state of the semaphore is unchanged, and the subroutine returns -1 and sets errno to indicate the error.

Error Codes

The sem trywait and sem wait subroutines fail if:

EACCES Permission is denied to access the unnamed semaphore.

EAGAIN The semaphore was already locked, so it cannot be immediately locked by the

sem_trywait subroutine.

EFAULT Invalid user address.

EIDRM Semaphore was removed during the required operation.

EINTR A signal interrupted the subroutine.

EINVAL The *sem* parameter does not refer to a valid semaphore.

ENOMEM Insufficient memory for the required operation.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"sem_open Subroutine" on page 154 and "sem_post Subroutine" on page 156.

sem unlink Subroutine

Purpose

Removes a named semaphore.

Library

Standard C Library (libc.a)

Syntax

#include <semaphore.h>

int sem unlink (name) const char *name;

Description

The **sem_unlink** subroutine removes the semaphore named by the string *name*.

If the semaphore named by name is currently referenced by other processes, then sem_unlink has no effect on the state of the semaphore. If one or more processes have the semaphore open when sem unlink is called, destruction of the semaphore is postponed until all references to the semaphore have been destroyed by calls to sem_close, _exit, or exec. Calls to sem_open to recreate or reconnect to the semaphore refer to a new semaphore after **sem_unlink** is called.

The **sem unlink** subroutine does not block until all references have been destroyed, and it returns immediately.

Parameters

name

Specifies the name of the semaphore to be unlinked.

Return Values

Upon successful completion, the sem_unlink subroutine returns a 0. Otherwise, the semaphore remains unchanged, -1 is returned, and errno is set to indicate the error.

Error Codes

The sem unlink subroutine fails if:

EACCES Permission is denied to unlink the named semaphore.

EFAULT Invalid user address.

ENAMETOOLONG The length of the *name* parameter exceeds PATH_MAX or a pathname component is longer

than NAME_MAX.

ENOENT The named semaphore does not exist.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

Related Information

"sem_open Subroutine" on page 154 and "sem_close Subroutine" on page 150.

semctl Subroutine

Purpose

Controls semaphore operations.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/sem.h>
int semctl (SemaphoreID, SemaphoreNumber, Command, arg)
int semctl (SemaphoreID, SemaphoreNumber, Command)
int SemaphoreID;
int SemaphoreNumber;
int Command;
union semun {
         int val;
         struct semid_ds *buf;
         unsigned short *array;
} arg;
```

If the fourth argument is required for the operation requested, it must be of type union semun and explicitly declared as shown above.

Description

The semctl subroutine performs a variety of semaphore control operations as specified by the Command parameter.

The following limits apply to semaphores:

- · Maximum number of semaphore IDs is 4096 for operating system releases before AIX 4.3.2 and 131072 for AIX 4.3.2 and following.
- Maximum number of semaphores per ID is 65,535.
- Maximum number of operations per call by the semop ("semop and semtimedop Subroutines" on page 165) subroutine is 1024.
- Maximum number of undo entries per procedure is 1024.
- Maximum semaphore value is 32,767.
- Maximum adjust-on-exit value is 16,384.

Parameters

SemaphoreID

Specifies the semaphore identifier.

SemaphoreNumber

Specifies the semaphore number.

arg.val Specifies the value for the semaphore for the **SETVAL** command.

arg.buf

Specifies the buffer for status information for the IPC STAT and IPC SET commands.

arg.array

Specifies the values for all the semaphores in a set for the GETALL and SETALL commands.

Command

Specifies semaphore control operations.

The following Command parameter values are executed with respect to the semaphore specified by the SemaphoreID and SemaphoreNumber parameters. These operations get and set the values of a sem structure, which is defined in the sys/sem.h file.

GETVAL

Returns the **semval** value, if the current process has read permission.

SETVAL

Sets the **semval** value to the value specified by the arg.val parameter, if the current process has write permission. When this Command parameter is successfully executed, the **semadi** value corresponding to the specified semaphore is cleared in all processes.

GETPID

Returns the value of the sempid field, if the current process has read permission.

GETNCNT

Returns the value of the semnont field, if the current process has read permission.

GETZCNT

Returns the value of the semzcnt field, if the current process has read permission.

The following Command parameter values return and set every semval value in the set of semaphores. These operations get and set the values of a sem structure, which is defined in the sys/sem.h file.

GETALL

Stores semvals values into the array pointed to by the arg.array parameter, if the current process has read permission.

SETALL

Sets **semvals** values according to the array pointed to by the arg.array parameter, if the current process has write permission. When this Command parameter is successfully executed, the semadi value corresponding to each specified semaphore is cleared in all processes.

The following Commands parameter values get and set the values of a semid_ds structure, defined in the sys/sem.h file. These operations get and set the values of a sem structure, which is defined in the sys/sem.h file.

IPC_STAT

Obtains status information about the semaphore identified by the SemaphoreID parameter. This information is stored in the area pointed to by the *arg.buf* parameter.

IPC SET

Sets the owning user and group IDs, and the access permissions for the set of semaphores associated with the SemaphoreID parameter. The IPC_SET operation uses as input the values found in the arg.buf parameter structure.

IPC SET sets the following fields:

sem_perm.uid User ID of the owner Group ID of the owner sem_perm.gid Permission bits only sem_perm.mode Creator's user ID sem_perm.cuid

> IPC_SET can only be executed by a process that has root user authority or an effective user ID equal to the value of the sem perm.uid or sem perm.cuid field in the data structure associated with the SemaphoreID parameter.

IPC RMID

Removes the semaphore identifier specified by the SemaphoreID parameter from the system and destroys the set of semaphores and data structures associated with it. This Command parameter can only be executed by a process that has root user authority or an effective user ID equal to the value of the sem perm.uid or sem perm.cuid field in the data structure associated with the SemaphoreID parameter.

Return Values

Upon successful completion, the value returned depends on the Command parameter as follows:

Command	Return Value
GETVAL	Returns the value of the semval field.
GETPID	Returns the value of the sempid field.
GETNCNT	Returns the value of the semncnt field.
GETZCNT	Returns the value of the semzent field.
All Others	Return a value of 0.

If the semctl subroutine is unsuccessful, a value of -1 is returned and the global variable errno is set to indicate the error.

Error Codes

The **semctl** subroutine is unsuccessful if any of the following is true:

EINVAL The SemaphoreID parameter is not a valid semaphore identifier.

EINVAL The SemaphoreNumber parameter is less than 0 or greater than or equal to the sem_nsems value.

EINVAL The *Command* parameter is not a valid command.

EACCES The calling process is denied permission for the specified operation. **ERANGE** The Command parameter is equal to the SETVAL or SETALL value and the value to which semval

value is to be set is greater than the system-imposed maximum.

The Command parameter is equal to the IPC_RMID or IPC_SET value and the calling process does not **EPERM**

have root user authority or an effective user ID equal to the value of the sem perm.uid or sem perm.cuid

field in the data structure associated with the SemaphoreID parameter.

EFAULT The arg.buf or arg.array parameter points outside of the allocated address space of the process.

The system does not have enough memory to complete the subroutine. ENOMEM

Related Information

The **semget** ("semget Subroutine") subroutine, **semop** ("semop and semtimedop Subroutines" on page 165) subroutine.

semget Subroutine

Purpose

Gets a set of semaphores.

Library

Standard C Library (libc.a)

Syntax

#include <sys/sem.h>

```
int semget (Key, NumberOfSemaphores, SemaphoreFlag)
key t Key;
int NumberOfSemaphores, SemaphoreFlag;
```

Description

The **semget** subroutine returns the semaphore identifier associated with the *Kev* parameter value.

The semget subroutine creates a data structure for the semaphore ID and an array containing the NumberOfSemaphores parameter semaphores if one of the following conditions is true:

- The Key parameter is equal to the IPC_PRIVATE operation.
- The Key parameter does not already have a semaphore identifier associated with it, and the **IPC CREAT** value is set.

Upon creation, the data structure associated with the new semaphore identifier is initialized as follows:

- The sem perm.cuid and sem perm.uid fields are set equal to the effective user ID of the calling process.
- The sem perm.cgid and sem perm.gid fields are set equal to the effective group ID of the calling process.
- · The low-order 9 bits of the sem perm.mode field are set equal to the low-order 9 bits of the SemaphoreFlag parameter.
- The sem nsems field is set equal to the value of the NumberOfSemaphores parameter.
- The sem otime field is set equal to 0 and the sem ctime field is set equal to the current time.

The data structure associated with each semaphore in the set is not initialized. The semctl ("semctl Subroutine" on page 160) subroutine (with the Command parameter values SETVAL or SETALL) can be used to initialize each semaphore.

If the Key parameter value is not IPC_PRIVATE, the IPC_EXCL value is not set, and a semaphore identifier already exists for the specified Key parameter, the value of the NumberOfSemaphores parameter specifies the number of semaphores that the current process needs.

If the NumberOfSemaphores parameter has a value of 0, any number of semaphores is acceptable. If the NumberOfSemaphores parameter is not 0, the **semget** subroutine is unsuccessful if the set contains fewer than the value of the NumberOfSemaphores parameter.

The following limits apply to semaphores:

- Maximum number of semaphore IDs is 4096 for operating system releases before AIX 4.3.2, 131072 for releases AIX 4.3.2 through AIX 5.2, and 1048576 for release AIX 5.3 and later.
- Maximum number of semaphores per ID is 65,535.
- Maximum number of operations per call by the semop subroutine is 1024.
- · Maximum number of undo entries per procedure is 1024.
- Maximum semaphore value is 32,767.
- Maximum adjust-on-exit value is 16,384.

Parameters

Kev

NumberOfSemaphores SemaphoreFlag

Specifies either the IPC_PRIVATE value or an IPC key constructed by the ftok subroutine (or a similar algorithm).

Specifies the number of semaphores in the set.

Constructed by logically ORing one or more of the following values:

IPC CREAT

Creates the data structure if it does not already exist.

IPC_EXCL

Causes the semget subroutine to fail if the IPC_CREAT value is also set and the data structure already exists.

S IRUSR

Permits the process that owns the data structure to read it.

S_IWUSR

Permits the process that owns the data structure to modify it.

S_IRGRP

Permits the group associated with the data structure to read it.

S IWGRP

Permits the group associated with the data structure to modify it.

S IROTH

Permits others to read the data structure.

S_IWOTH

Permits others to modify the data structure.

Values that begin with the S_I prefix are defined in the sys/mode.h file and are a subset of the access permissions that apply to files.

Return Values

Upon successful completion, the **semget** subroutine returns a semaphore identifier. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **semget** subroutine is unsuccessful if one or more of the following conditions is true:

EACCES A semaphore identifier exists for the Key parameter but operation permission, as specified by the

low-order 9 bits of the SemaphoreFlag parameter, is not granted.

EINVAL A semaphore identifier does not exist and the NumberOfSemaphores parameter is less than or equal to a

value of 0, or greater than the system-imposed value.

EINVAL A semaphore identifier exists for the Key parameter, but the number of semaphores in the set associated

with it is less than the value of the NumberOfSemaphores parameter and the NumberOfSemaphores

parameter is not equal to 0.

ENOENT A semaphore identifier does not exist for the Key parameter and the IPC_CREAT value is not set.

ENOSPC Creating a semaphore identifier would exceed the maximum number of identifiers allowed systemwide.

EEXIST A semaphore identifier exists for the Key parameter, but both the IPC CREAT and IPC EXCL values are

ENOMEM There is not enough memory to complete the operation.

Related Information

The ftok subroutine, semctl ("semctl Subroutine" on page 160) subroutine, semop ("semop and semtimedop Subroutines") subroutine.

The mode.h file.

semop and semtimedop Subroutines

Purpose

Performs semaphore operations.

Library

Standard C Library (libc.a)

Syntax

```
#include <svs/sem.h>
int semop (SemaphoreID, SemaphoreOperations, NumberOfSemaphoreOperations)
int SemaphoreID;
struct sembuf * SemaphoreOperations;
size t NumberOfSemaphoreOperations;
#include <sys/sem.h>
int semtimedop (SemaphoreID, SemaphoreOperations,
NumberOfSemaphoreOperations, Timeout)
int SemaphoreID:
struct sembuf * SemaphoreOperations;
size t NumberOfSemaphoreOperations;
struct timespec * timeout;
```

Description

The **semop** and **semtimedop** subroutines perform operations on the set of semaphores associated with the semaphore identifier specified by the SemaphoreID parameter.

The **semtimedop** subroutine limits the time the caller will sleep while waiting for the semaphore operation(s) to complete. The **timespec** structure is defined in the **/usr/include/sys/time.h** file and includes the following fields:

tv_sec Seconds on timer tv_nsec Nanoseconds on timer

If the caller sleeps for the time allotted by the **timespec** structure before the operation(s) can be completed, the current operation is aborted and the **semtimedop** subroutine will return an error.

The **sembuf** structure is defined in the **usr/include/sys/sem.h** file. Each **sembuf** structure specified by the *SemaphoreOperations* parameter includes the following fields:

sem_num Semaphore number sem_op Semaphore operation sem_flg Operation flags

Each semaphore operation specified by the sem_op field is performed on the semaphore specified by the *SemaphoreID* parameter and the sem_num field. The sem_op field specifies one of three semaphore operations.

- 1. If the sem_op field is a negative integer and the calling process has permission to alter, one of the following conditions occurs:
 - If the **semval** variable (see the /usr/include/sys/sem.h file) is greater than or equal to the absolute value of the sem_op field, the absolute value of the sem_op field is subtracted from the **semval** variable. In addition, if the **SEM_UNDO** flag is set in the sem_flg field, the absolute value of the sem op field is added to the **semadj** value of the calling process for the specified semaphore.
 - If the **semval** variable is less than the absolute value of the sem_op field and the **IPC_NOWAIT** value is set in the sem flg field, the **semop** or **semtimedop** subroutine returns immediately.
 - If the **semval** variable is less than the absolute value of the sem_op field and the **IPC_NOWAIT** value is not set in the sem_flg field, the **semop** and **semtimedop** subroutine increments the semnent field associated with the specified semaphore and suspends the calling process until one of the following conditions occurs:
 - The value of the **semval** variable becomes greater than or equal to the absolute value of the sem_op field. The value of the semncnt field associated with the specified semaphore is then decremented, and the absolute value of the sem_op field is subtracted from the **semval** variable. In addition, if the **SEM_UNDO** flag is set in the sem_flg field, the absolute value of the sem_op field is added to the **semadj** value of the calling process for the specified semaphore.
 - The SemaphoreID parameter for which the calling process is awaiting action is removed from the system. When this occurs, the errno global variable is set to the EIDRM flag and a value of -1 is returned.
 - The calling process received a signal that is to be caught. When this occurs, the **semop** and **semtimedop** subroutine decrements the value of the semnont field associated with the specified semaphore. When the semzont field is decremented, the calling process resumes as prescribed by the **sigaction** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine.
 - The calling process sleeps for the time allotted by the timespec structure. When this occurs, the errno global variable is set to the ETIMEDOUT flag and a value of -1 is returned.
- 2. If the sem_op field is a positive integer and the calling process has alter permission, the value of the sem_op field is added to the **semval** variable. In addition, if the **SEM_UNDO** flag is set in the sem_flg field, the value of the sem_op field is subtracted from the calling process's **semadj** value for the specified semaphore.
- 3. If the value of the sem_op field is 0 and the calling process has read permission, one of the following occurs:

- If the **semval** variable is 0, the **semop** or **semtimedop** subroutine returns immediately.
- If the semval variable is not equal to 0 and IPC NOWAIT value is set in the sem flq field, the semop or semtimedop subroutine returns immediately.
- If the semval variable is not equal to 0 and the IPC_NOWAIT value is set in the sem flg field, the semop or semtimedop subroutine increments the semzent field associated with the specified semaphore and suspends execution of the calling process until one of the following occurs:
 - The value of the **semval** variable becomes 0. When this occurs, the value of the semzent field associated with the specified semaphore is decremented.
 - The SemaphoreID parameter for which the calling process is awaiting action is removed from the system. If this occurs, the errno global variable is set to the EIDRM error code and a value of -1 is returned.
 - The calling process received a signal that is to be caught. When this occurs, the **semop** or semtimedop subroutine decrements the value of the semzont field associated with the specified semaphore. When the semzent field is decremented, the calling process resumes execution as prescribed by the **sigaction** subroutine.
 - The calling process sleeps for the time allotted by the **timespec** structure. When this occurs, the errno global variable is set to the ETIMEDOUT flag and a value of -1 is returned.

Note: Calling the semtimedop subroutine with an invalid *Timeout* parameter will prevent the calling process from being suspended if necessary. If the *Timeout* parameter specified to the **semtimedop** subroutine is not valid and the calling process needs to be suspended, then the errno global variable will be set to indicate the error and a value of -1 will be returned.

The following limits apply to semaphores:

- Maximum number of semaphore IDs is 4096 for operating system releases before AIX 4.3.2 and 131072 for AIX 4.3.2 and following.
- Maximum number of semaphores per ID is 65,535.
- Maximum number of operations per call by the **semop** subroutine is 1024.
- · Maximum number of undo entries per procedure is 1024.
- Maximum capacity of a semaphore value is 32,767 bytes.
- Maximum adjust-on-exit value is 16,384 bytes.

Parameters

SemaphoreID Specifies the semaphore identifier.

NumberOfSemaphoreOperations Specifies the number of structures in the array.

SemaphoreOperations Points to an array of structures, each of which specifies a

semaphore operation.

Timeout Points to a structure specifying an interval of time beyond which

the operation should not sleep.

Return Values

Upon successful completion, the **semop** and **semtimedop** subroutines return a value of 0. Also, the SemaphoreID parameter value for each semaphore that is operated upon is set to the process ID of the calling process.

If the **semop** or **semtimedop** subroutine is unsuccessful, a value of -1 is returned and the **errno** global variable is set to indicate the error. If the SEM ORDER flag was set in the sem flg field for the first semaphore operation in the SemaphoreOperations array, the SEM ERR value is set in the sem flq field for the unsuccessful operation.

If the SemaphoreID parameter for which the calling process is awaiting action is removed from the system, the errno global variable is set to the EIDRM error code and a value of -1 is returned.

Error Codes

The semop or semtimedop subroutine is unsuccessful if one or more of the following are true for any of the semaphore operations specified by the SemaphoreOperations parameter. If the operations were performed individually, the discussion of the SEM_ORDER flag provides more information about error situations.

EINVAL	The SemaphoreID parameter is not a valid semaphore identifier.		
EINVAL	The number of individual semaphores for which the calling process requests a SEM_UNDO flag would exceed the limit.		
EINVAL	The <i>Timeout</i> parameter specified a tv_sec or tv_nsec value less than 0, or a tv_nsec value greater than 1000 million.		
EFBIG	The sem_num value is less than 0 or it is greater than or equal to the number of semaphores in the set associated with the <i>SemaphoreID</i> parameter.		
E2BIG	The NumberOfSemaphoreOperations parameter is greater than the system-imposed maximum.		
EACCES	The calling process is denied permission for the specified operation.		
EAGAIN	The operation would result in suspension of the calling process, but the IPC_NOWAIT value is set in the sem_flg field.		
ENOSPC	The limit on the number of individual processes requesting a SEM_UNDO flag would be exceeded.		
EINVAL	The number of individual semaphores for which the calling process requests a SEM_UNDO flag would exceed the limit.		
ERANGE	An operation would cause a semval value to overflow the system-imposed limit.		
ERANGE	An operation would cause a semadj value to overflow the system-imposed limit.		
EFAULT	The SemaphoreOperations parameter points outside of the address space of the process.		
EINTR	A signal interrupted the semop subroutine.		
EIDRM	The semaphore identifier <i>SemaphoreID</i> parameter has been removed from the system.		
EFAULT	The Timeout parameter points to an invalid address.		
ETIMEDOUT	The time specified by the <i>Timeout</i> parameter expired before the requested operations could be completed.		

Related Information

The **exec** subroutine, **exit** subroutine, **fork** subroutine, **semctl** ("semctl Subroutine" on page 160) subroutine, semget ("semget Subroutine" on page 163) subroutine, sigaction ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine.

setacldb or endacldb Subroutine

Purpose

Opens and closes the SMIT ACL database.

Library

Security Library (libc.a)

Syntax

#include <usersec.h> int setacldb(Mode) int Mode; int endacldb;

Description

These functions may be used to open and close access to the user SMIT ACL database. Programs that call the getusraclattr or getgrpaclattr subroutines should call the setacldb subroutine to open the database and the **endacldb** subroutine to close the database.

The **setacldb** subroutine opens the database in the specified mode, if it is not already open. The open count is increased by 1.

The endacldb subroutine decreases the open count by 1 and closes the database when this count goes to 0. Any uncommitted changed data is lost.

Parameters

Mode

Specifies the mode of the open. This parameter may contain one or more of the following values defined in the usersec.h file:

S READ

Specifies read access.

S WRITE

Specifies update access.

Return Values

The **setacldb** and **endacldb** subroutines return a value of 0 to indicate success. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **setacldb** subroutine fails if the following is true:

EACCES Access permission is denied for the data request.

Both subroutines return errors from other subroutines.

Security

Security Files Accessed: The calling process must have access to the SMIT ACL data.

Mode File rw/etc/security/smitacl.user

Related Information

The getgrpaclattr, nextgrpacl, or putgrpaclattr subroutine, getusraclattr, nextusracl, or putusraclattr subroutine.

setauthdb or setauthdb r Subroutine

Purpose

Defines the current administrative domain.

Library

Standard C Library (libc.a)

Syntax

```
#include <usersec.h>
int setauthdb (New, Old)
authdb_t *New;
authdb_t *Old;
int setauthdb r (New, Old)
authdb t *New;
authdb_t *Old;
```

Description

The **setauthdb** and **setauthdb_r** subroutines set the value of the current administrative domain in the New parameter. The **setauthdb** subroutine sets the value of the current process-wide administrative domain. The **setauthdb** r subroutine sets the administrative domain for the current thread if one has been set. The subroutines return -1 if no administrative domain has been set. The current administrative domain is returned in the Old parameter. The Old parameter can be a null pointer if the value of the current administrative domain is not wanted.

The administrative domain determines which user and group information databases will be queried by the user and group library functions. The default behavior is to access all of the defined administrative domains. The setauthdb subroutine restricts the user and group library functions to the named administrative domains for all threads in the current process. The setauthdb r subroutine restricts the user and group library functions to the named administrative domain for the current thread. The default behavior can be restored by using a null pointer for the value of the New parameter or an empty string for the value of the New parameter.

The string referenced by the New parameter must be the string files, compat or an administrative domain defined in the /usr/lib/security/methods.cfg file. The New and Old parameters are of type authdb t. The authdb t type is a 16-character array that contains the name of a loadable authentication module.

Note: The setauthdb subroutine affects all threads in the current process and can cause unintended results.

Parameters

Pointer to the name of the new database module. The New New parameter must reference a value module name

> contained in the /usr/lib/security/methods.cfg file, or one of the predefined values (BUILTIN, compat, or files). The empty string can be used to remove the restriction on

which modules are used.

Pointer to where the name of the current module will be stored. A NULL value for the Old parameter can be used if

the current name of the database is not wanted.

Return Values

0 The module search restriction has been successfully changed.

Old

The module search restriction could not be changed. The errno variable must be examined to determine the cause of the failure.

-1

Error Codes

EINVAL The new_auth_db parameter is longer than the

permissible length of a stanza in the /usr/lib/security/

methods.cfg file (15 characters).

ENOENT The new_auth_dbdoes not reference a valid stanza in /usr/lib/security/methods.cfg or one of the predefined

Related Information

getauthdb or getauthdb r Subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

setbuf, setvbuf, setbuffer, or setlinebuf Subroutine

Purpose

Assigns buffering to a stream.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdio.h>
void setbuf ( Stream, Buffer)
FILE *Stream;
char *Buffer;
int setvbuf (Stream, Buffer, Mode, Size)
FILE *Stream;
char *Buffer;
int Mode;
size_t Size;
void setbuffer (Stream, Buffer, Size)
FILE *Stream;
char *Buffer;
size_t Size;
void setlinebuf (Stream)
FILE *Stream;
```

Description

The **setbuf** subroutine causes the character array pointed to by the *Buffer* parameter to be used instead of an automatically allocated buffer. Use the setbuf subroutine after a stream has been opened, but before it is read or written.

If the Buffer parameter is a null character pointer, input/output is completely unbuffered.

A constant, BUFSIZ, defined in the stdio.h file, tells how large an array is needed:

char buf[BUFSIZ];

For the **setvbuf** subroutine, the *Mode* parameter determines how the *Stream* parameter is buffered:

IOFBF Causes input/output to be fully buffered.

IOLBF Causes output to be line-buffered. The buffer is flushed when a new line is written, the buffer is full, or

input is requested.

IONBF Causes input/output to be completely unbuffered.

If the Buffer parameter is not a null character pointer, the array it points to is used for buffering. The Size parameter specifies the size of the array to be used as a buffer, but all of the Size parameter's bytes are not necessarily used for the buffer area. The constant **BUFSIZ** in the **stdio.h** file is one buffer size. If input/output is unbuffered, the subroutine ignores the Buffer and Size parameters. The setbuffer subroutine, an alternate form of the setbuf subroutine, is used after Stream has been opened, but before it is read or written. The character array Buffer, whose size is determined by the Size parameter, is used instead of an automatically allocated buffer. If the Buffer parameter is a null character pointer, input/output is completely unbuffered.

The setbuffer subroutine is not needed under normal circumstances because the default file I/O buffer size is optimal.

The setlinebuf subroutine is used to change the stdout or stderr file from block buffered or unbuffered to line-buffered. Unlike the setbuf and setbuffer subroutines, the setlinebuf subroutine can be used any time Stream is active.

A buffer is normally obtained from the malloc subroutine at the time of the first getc subroutine or putc subroutine on the file, except that the standard error stream, stderr, is normally not buffered.

Output streams directed to terminals are always either line-buffered or unbuffered.

Note: A common source of error is allocating buffer space as an automatic variable in a code block, and then failing to close the stream in the same block.

The **setbuffer** and **setlinebuf** subroutines are included for compatibility with Berkeley System Distribution (BSD).

Parameters

Stream Specifies the input/output stream.

Buffer Points to a character array.

Mode Determines how the *Stream* parameter is buffered.

Size Specifies the size of the buffer to be used.

Return Values

Upon successful completion, setvbuf returns a value of 0. Otherwise it returns a nonzero value if a value that is not valid is given for type, or if the request cannot be honored.

Related Information

The Input and Output Handling in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setcsmap Subroutine

Purpose

Reads a code-set map file and assigns it to the standard input device.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/termios.h>
int setcsmap (Path);
char * Path;
```

Description

The **setcsmap** subroutine reads in a code-set map file. The *path* parameter specifies the location of the code-set map file. The path is usually composed by forming a string with the csmap directory and the code set, as in the following example:

```
n=sprintf(path, "%s%s", CSMAP DIR, nl langinfo(CODESET));
```

The file is processed and according to the included informations, the **setcsmap** subroutine changes the tty configuration. Multibyte processing may be enabled, and converter modules may be pushed onto the tty stream.

Parameter

Path Names the code-set map file.

Return Values

If a code set-map file is successfully opened and compiled, a value of 0 is returned. If an error occurred, a value of 1 is returned and the errno global variable is set to identify the error.

Error Codes

EINVAL Indicates an invalid value in the code set map.

FIO An I/O error occurred while the file system was being read. ENOMEM Insufficient resources are available to satisfy the request.

EFAULT A kernel service, such as copyin, has failed.

ENOENT The named file does not exist. The named file cannot be read. **EACCES**

Related Information

The **setmaps** command.

The **setmaps** file format.

tty Subsystem Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setea Subroutine

Purpose

Sets an extended attribute value.

Syntax

```
#include <sys/ea.h>
int setea(const char *path, const char *name,
        void *value, size t size, int flags);
int fsetea(int filedes, const char *name,
        void *value, size t size, int flags);
int lsetea(const char *path, const char *name,
        void *value, size_t size, int flags);
```

Description

Extended attributes are name: value pairs associated with the file system objects (such as files, directories, and symlinks). They are extensions to the normal attributes that are associated with all objects in the file system (that is, the stat(2) data).

Do not define an extended attribute name with the 8-character prefix "(0xF8)SYSTEM(0xF8)". Prefix "(0xF8)SYSTEM(0xF8)" is reserved for system use only.

Note: 0xF8 represents a non-printable character.

The **setea** subroutine sets the value of the extended attribute identified by *name* and associated with the given path in the file system. The size of the value must be specified. The fsetea subroutine is identical to setea, except that it takes a file descriptor instead of a path. The **Isetea** subroutine is identical to setea, except, in the case of a symbolic link, the link itself is interrogated rather than the file that it refers to.

Parameters

path The path name of the file.

The name of the extended attribute. An extended attribute name is a NULL-terminated string. name value A pointer to the value of an attribute. The value of an extended attribute is an opaque byte

stream of specified length.

size The length of the value. filedes A file descriptor for the file. None are defined at this time. flags

Return Values

If the **setea** subroutine succeeds, 0 is returned. Upon failure, -1 is returned and **errno** is set appropriately.

Error Codes

EACCES Caller lacks write permission to the base file, or lacks the appropriate ACL privileges for

named attribute write.

EDQUOT Because of quota enforcement, the remaining space is insufficient to store the extended

attribute.

EFAULT A bad address was passed for path, name, or value.

EFORMAT File system is capable of supporting EAs, but EAs are disabled.

EINVAL No flags should be specified.

EINVAL A path-like name should not be used (such as **zml/file**, . and ..). **ENAMETOOLONG** The path or name value is too long.

ENOSPC The remaining space is insufficient to store the extended attribute.

ENOTSUP Extended attributes are not supported by the file system.

The errors documented for the stat(2) system call are also applicable here.

Related Information

The getea Subroutine, listea Subroutine, "removeea Subroutine" on page 57, and "statea Subroutine" on page 324

setgid, setrgid, setegid, or setgidx Subroutine

Purpose

Sets the process group IDs.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
int setgid (GID)
gid_t GID;
int setrgid (RGID)
gid_t RGID;
int setegid (EGID)
gid t EGID;
int setregid (RGID, EGID)
gid_t RGID;
gid_t EGID;
#include <unistd.h>
#include <sys/id.h>
int setgidx ( which, GID )
int which;
gid t GID;
```

Description

The setgid, setrgid, setegid, setregid, and setgidx subroutines set the process group IDs of the calling process. The following semantics are supported:

setgid

If the effective user ID of the process is the root user, the process's real, effective, and saved group IDs are set to the value of the GID parameter. Otherwise, the process effective group ID is reset if the GID parameter is equal to either the current real or saved group IDs, or one of its supplementary group IDs. Supplementary group IDs of the calling process are not changed.

setegid

The process effective group ID is reset if one of the following conditions is met:

- The EGID parameter is equal to either the current real or saved group IDs.
- The EGID parameter is equal to one of its supplementary group IDs.
- · The effective user ID of the process is the root user.

setrgid

The **EPERM** error code is always returned.

setregid

The RGID and EGID parameters can have one of the following relationships:

RGID != EGID

If the EGID parameter is equal to either the process's real or saved group IDs, the process effective group ID is set to the EGID parameter. Otherwise, the EPERM error code is

RGID == EGID

If the effective user ID of the process is the root user, the process's real and effective group IDs are set to the EGID parameter. If the EGID parameter is equal to the process's real or saved group IDs, the process effective group ID is set to EGID. Otherwise, the EPERM error code is returned.

setgidx

The which parameter can have one of the following values:

ID EFFECTIVE

GID must be either the real or saved GID or one of the values in the concurrent group set. The effective group ID for the current process will be set to *GID*.

ID EFFECTIVEIID REAL

Invoker must have appropriate privilege. The real and effective group ID for the current process will be set to GID.

ID EFFECTIVEIID REALIID SAVED

Invoker must have appropriate privilege. The real, effective and saved group ID for the current process will be set to GID.

The **setegid**, **setrgid**, **setregid**, and **setgidx** subroutines are thread-safe.

The operating system does not support **setuid** ("setuid, setruid, setreuid, setreuid or setuidx Subroutine" on page 194) or setgid shell scripts.

These subroutines are part of Base Operating System (BOS) Runtime.

Parameters

GID	Specifies the value of the group ID to set.
RGID	Specifies the value of the real group ID to set.
EGID	Specifies the value of the effective group ID to set.
which	Specifies which group ID values to set.

Return Values

- 0 Indicates that the subroutine was successful.
- -1 Indicates the subroutine failed. The errno global variable is set to indicate the error.

Error Codes

If the **setgid**, **setegid**, or **setgidx** subroutine fails, one or more of the following are returned:

EPERM Indicates the process does not have appropriate privileges and the GID or EGID parameter is not equal to either the real or saved group IDs of the process.

EINVAL Indicates the value of the GID, EGID or which parameter is invalid.

Related Information

The getgid subroutine, getgroups subroutine, setgroups ("setgroups Subroutine" on page 177) subroutine, setuid ("setuid, setruid, setreuid or setuidx Subroutine" on page 194) subroutine. The **setgroups** command.

List of Security and Auditing Subroutines, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setgroups Subroutine

Purpose

Sets the supplementary group ID of the current process.

Library

Standard C Library (libc.a)

Syntax

```
#include <grp.h>
int setgroups ( NumberGroups, GroupIDSet)
int NumberGroups;
gid t *GroupIDSet;
```

Description

The setgroups subroutine sets the supplementary group ID of the process. The setgroups subroutine cannot set more than NGROUPS MAX groups in the group set. (NGROUPS MAX is a constant defined in the limits.h file.)

Note: The routine may coredump instead of returning EFAULT when an invalid pointer is passed in case of 64-bit application calling 32-bit kernel interface.

Parameters

GroupIDSet Pointer to the array of group IDs to be established.

NumberGroups Indicates the number of entries in the *GroupIDSet* parameter.

Return Values

Upon successful completion, the setgroups subroutine returns a value of 0. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **setgroups** subroutine fails if any of the following are true:

EFAULT The NumberGroups and GroupIDSet parameters specify an array that is partially or completely outside of the process' allocated address space.

EINVAL The NumberGroups parameter is greater than the NGROUPS_MAX value.

A group ID in the GroupIDSet parameter is not presently in the supplementary group ID, and the invoker **EPERM**

does not have root user authority.

setimp or longimp Subroutine

Purpose

Saves and restores the current execution context.

Library

Standard C Library (libc.a)

Syntax

```
#include <setjmp.h>
int setjmp (Context)
jmp buf Context;
void longjmp ( Context, Value)
jmp buf Context;
int Value;
int _setjmp (Context)
jmp buf Context;
void _longjmp (Context, Value)
jmp buf Context;
int Value;
```

Description

The **setimp** subroutine and the **longimp** subroutine are useful when handling errors and interrupts encountered in low-level subroutines of a program.

The setimp subroutine saves the current stack context and signal mask in the buffer specified by the Context parameter.

The **longimp** subroutine restores the stack context and signal mask that were saved by the **setimp** subroutine in the corresponding *Context* buffer. After the **longimp** subroutine runs, program execution continues as if the corresponding call to the **setimp** subroutine had just returned the value of the Value parameter. The subroutine that called the **setimp** subroutine must not have returned before the completion of the longimp subroutine. The setimp and longimp subroutines save and restore the signal mask sigmask (2), while _setjmp and _longjmp manipulate only the stack context.

If a process is using the AT&T System V sigset interface, then the setimp and longimp subroutines do not save and restore the signal mask. In such a case, their actions are identical to those of the setimp and longimp subroutines.

Parameters

Context Specifies an address for a jmp_buf structure.

Value Indicates any integer value.

Return Values

The **setimp** subroutine returns a value of 0, unless the return is from a call to the **longimp** function, in which case **setimp** returns a nonzero value.

The longimp subroutine cannot return 0 to the previous context. The value 0 is reserved to indicate the actual return from the **setimp** subroutine when first called by the program. The **longimp** subroutine does not return from where it was called, but rather, program execution continues as if the corresponding call to **setimp** was returned with a returned value of *Value*.

If the longimp subroutine is passed a Value parameter of 0, then execution continues as if the corresponding call to the setimp subroutine had returned a value of 1. All accessible data have values as of the time the **longimp** subroutine is called.

Attention: If the longjmp subroutine is called with a Context parameter that was not previously set by the **setimp** subroutine, or if the subroutine that made the corresponding call to the **setimp** subroutine has already returned, then the results of the longimp subroutine are undefined. If the longimp subroutine detects such a condition, it calls the **longimperror** routine. If **longimperror** returns, the program is aborted. The default version of longimperror prints the message: longjmp or siglongjmp used outside of saved context to standard error and returns. Users wishing to exit in another manner can write their own version of the longimperror program.

Related Information

The **sigsetimp** or **siglongimp** ("sigsetimp or siglongimp Subroutine" on page 235) subroutine.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setiopri Subroutine

Purpose

Enables the setting of a process I/O priority.

Syntax

short setiopri (ProcessID, IOPriority); pid_t ProcessID;ushort IOPriority

Description

The setiopri subroutine sets the I/O scheduling priority of all threads in a process to be a constant. If the target process ID does not match the process ID of the caller, the caller must either be running as root or have an effective and real user ID that matches the target process. A smaller value for the IOPriority designates a higher scheduling priority. Only a few I/O devices support priorities.

Parameters

ProcessID

Specifies the process ID. If this value is -1, the current process I/O scheduling priority is set to a constant.

Return Values

Upon successful completion, the **setiopri** subroutine returns the former I/O scheduling priority of the process just changed. A returned value of IOPRIORITY UNSET indicates that the I/O priority was not set. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Errors

EINVAL IOPriority value is invalid.

EPERM The calling process is not root. It does not have the same process ID as the target

process, and does not have the same real effective user ID as the target process.

ESRCH No process can be found corresponding to the specified *ProcessID*.

Implementation Specifics

1. Implementation requires an additional field in the **proc** structure.

- 2. The default setting for process I/O priority is IOPRIORITY_UNSET.
- 3. Once set, process I/O priorities should be inherited across a fork. I/O priorities should not be inherited across an exec.
- 4. The **setiopri** system call generates an auditing event using *audit_svcstart* if auditing is enabled on the system (audit flag is true).

Related Information

The **getiopri** subroutine, **getpri** subroutine, "setpri Subroutine" on page 190.

setlocale Subroutine

Purpose

Changes or queries the program's entire current locale or portions thereof.

Library

Standard C Library (libc.a)

Syntax

#include <locale.h>

char *setlocale (Category, Locale) int Category; const char *Locale;

Description

The setlocale subroutine selects all or part of the program's locale specified by the Category and Locale parameters. The setlocale subroutine then changes or queries the specified portion of the locale. The LC ALL value for the Category parameter names the entire locale (all the categories). The other Category values name only a portion of the program locale.

The Locale parameter specifies a string that provides information needed to set certain conventions in the Category parameter. The components of the Locale parameter are language and territory. Values allowed for the locale argument are the predefined language_territory combinations or a user-defined locale.

If a user defines a new locale, a uniquely named locale definition source file must be provided. The character collation, character classification, monetary, numeric, time, and message information should be provided in this file. The locale definition source file is converted to a binary file by the localedef command. The binary locale definition file is accessed in the directory specified by the LOCPATH environment variable.

Note: All setuid and setgid programs will ignore the LOCPATH environment variable.

The default locale at program startup is the C locale. A call to the **setlocale** subroutine must be made explicitly to change this default locale environment. See Understanding Locale Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs for setlocale subroutine examples.

The locale state is common to all threads within a process.

Parameters

Category

Specifies a value representing all or part of the locale for a program. Depending on the value of the Locale parameter, these categories may be initiated by the values of environment variables with corresponding names. Valid values for the Category parameter, as defined in the locale.h file, are:

LC ALL

Affects the behavior of a program's entire locale.

LC COLLATE

Affects the behavior of regular expression and collation subroutines.

LC CTYPE

Affects the behavior of regular expression, character-classification, case-conversion, and wide character subroutines.

LC MESSAGES

Affects the content of messages and affirmative and negative responses.

LC MONETARY

Affects the behavior of subroutines that format monetary values.

LC_NUMERIC

Affects the behavior of subroutines that format nonmonetary numeric values.

LC TIME

Affects the behavior of time-conversion subroutines.

Locale

Points to a character string containing the required setting for the Category parameter.

The following are special values for the *Locale* parameter:

"**C**" The C locale is the locale all programs inherit at program startup.

"POSIX"

Specifies the same locale as a value of "C".

Specifies categories be set according to locale environment variables.

Queries the current locale environment and returns the name of the locale. NULL

For more information about supported locale values for the Locale parameter, see Supported languages and locales in AIX 5L Version 5.3 National Language Support Guide and Reference.

Return Values

If a pointer to a string is given for the Locale parameter and the selection can be honored, the setlocale subroutine returns the string associated with the specified Category parameter for the new locale. If the selection cannot be honored, a null pointer is returned and the program locale is unchanged.

If a null is used for the Locale parameter, the setlocale subroutine returns the string associated with the Category parameter for the program's current locale. The program's locale is not changed.

A subsequent call with the string returned by the setlocale subroutine, and its associated category, will restore that part of the program locale. The string returned is not modified by the program, but can be overwritten by a subsequent call to the **setlocale** subroutine.

Related Information

The localeconv subroutine, nl_langinfo subroutine, rpmatch ("rpmatch Subroutine" on page 69) subroutine.

National Language Support Overview and Setting the Locale in AIX 5L Version 5.3 National Language Support Guide and Reference.

setpagvalue or setpagvalue64 Subroutine

Purpose

Sets the Process Authentication Group (PAG) value for a given PAG type.

Library

Security Library (libc.a)

Syntax

```
#include <pag.h>
int setpagvalue ( name, value )
char * name;
int value;
uint64 t setpagvalue64( name, value );
char * name;
uint64 value;
```

Description

The setpagvalue or setpagvalue64 subroutine sets the PAG value for a given PAG name. For these functions to succeed, the PAG name must be registered with the operating system before these subroutines are called.

Parameters

A 1-character to 4-character, NULL-terminated name for the PAG type. Typical values include afs, dfs, name

pki, and krb5.

value New PAG value for the given *name*.

Return Values

The **setpagvalue** and **setpagvalue64** subroutines return a PAG value upon successful completion. Upon a failure, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The setpagvalue and setpagvalue64 subroutines fail if the following condition is true:

EINVAL

The named PAG type does not exist as part of the table.

Other errors might be set by subroutines invoked by the **setpaqvalue** and **setpaqvalue64** subroutines.

_pag_getid System Call, __pag_getname System Call, __pag_getvalue System Call, __pag_setname System Call, __pag_setvalue System Call, kcred_genpagvalue Kernel Service, kcred_getpagid Kernel Service, and kcred_getpagname Kernel Service.

List of Security and Auditing Subroutines in AIX 5L Version 5.3 General Programming Concepts.

setpcred Subroutine

Purpose

Sets the current process credentials.

Library

Security Library (libc.a)

Syntax

#include <usersec.h>

```
int setpcred ( User, Credentials)
char **Credentials;
char *User;
```

Description

The **setpcred** subroutine sets a process' credentials according to the *Credentials* parameter. If the *User* parameter is specified, the credentials defined for the user in the user database are used. If the Credentials parameter is specified, the credentials in this string are used. If both the User and Credentials parameters are specified, both the user's and the supplied credentials are used. However, the supplied credentials of the Credentials parameter will override those of the user. At least one parameter must be specified.

The **setpcred** subroutine requires the **setpenv** subroutine to follow it.

Note: If the auditwrite subroutine is to be called from a program invoked from the inittab file, the **setpcred** subroutine should be called first to establish the process' credentials.

User Specifies the user for whom credentials are being established.

Credentials

Defines specific credentials to be established. This parameter points to an array of null-terminated character strings that may contain the following values. The last character string must be null.

LOGIN_USER=%s

Login user name

REAL_USER=%s

Real user name

REAL_GROUP=%s

Real group name

GROUPS=%s

Supplementary group ID

AUDIT_CLASSES=%s

Audit classes

RLIMIT CPU=%d

Process soft CPU limit

RLIMIT_FSIZE=%d

Process soft file size

RLIMIT DATA=%d

Process soft data segment size

RLIMIT_STACK=%d

Process soft stack segment size

RLIMIT_CORE=%d

Process soft core file size

RLIMIT_RSS=%d

Process soft resident set size

RLIMIT_CORE_HARD=%d

Process hard core file size

RLIMIT CPU HARD=%d

Process hard CPU limit

RLIMIT_DATA_HARD=%d

Process hard data segment size

RLIMIT FSIZE HARD=%d

Process hard file size

RLIMIT RSS HARD=%d

Process hard resident set size

RLIMIT STACK HARD=%d

Process hard stack segment size

UMASK=%o

Process umask (file creation mask)

A process must have root user authority to set all credentials except the UMASK credential.

Resource	Hard	Soft	
RLIMIT CORE	unlimited	%d	
RLIMIT CPU	%d	%d	
RLIMIT DATA	unlimited	%d	
RLIMIT FSIZE	%d	%d	
RLIMIT RSS	unlimited	%d	
RLIMIT STACK	unlimited	%d	

The soft limit credentials will override the equivalent hard limit credentials that may proceed them. To set the hard limits, the hard limit credentials should follow the soft limit credentials.

Return Values

Upon successful return, the **setpcred** subroutine returns a value of 0. If **setpcred** fails, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **setpcred** subroutine fails if one or more of the following are true:

EINVAL The *Credentials* parameter contains invalid credentials specifications.

EINVAL The User parameter is null and the Credentials parameter is either null or points to an empty string.

EPERM The process does not have the proper authority to set the requested credentials.

Other errors may be set by subroutines invoked by the **setpcred** subroutine.

Related Information

The auditwrite subroutine, ckuseracct subroutine, ckuserID subroutine, getpcred subroutine, getpenv subroutine, setpenv ("setpenv Subroutine") subroutine.

List of Security and Auditing Subroutines, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setpenv Subroutine

Purpose

Sets the current process environment.

Library

Security Library (libc.a)

Syntax

#include <usersec.h>

int setpenv (User, Mode, Environment, Command) char *User; int *Mode*; char **Environment; char *Command;

Description

The setpenv subroutine first sets the environment of the current process according to its parameter values, and then sets the working directory and runs a specified command. If the *User* parameter is specified, the process environment is set to that of the specified user, the user's working directory is set, and the specified command run. If the User parameter is not specified, then the environment and working directory are set to that of the current process, and the command is run from this process. The environment consists of both user-state and system-state environment variables.

Note: The setpenv subroutine requires the setpcred subroutine to precede it.

The **setpenv** subroutine performs the following steps:

Setting the Process Environment

Setting the Process Current Working Directory

Executing the Initial Program

The first step involves changing the user-state and system-state environment. Since this is dependent on the values of the *Mode* and *Environment* parameters, see the description for the *Mode* parameter for more information.

After the user-state and system-state environment is set, the working directory of the process may be set. If the Mode parameter includes the PENV_INIT value, the current working directory is changed to the user's initial login directory (defined in the /etc/passwd file). Otherwise, the current working directory is unchanged. After the working directory of the process is reset, the initial program (usually the shell interpreter) is executed. If the Command parameter is null, the shell from the user database is used. If the parameter is not defined, the shell from the user-state environment is used and the Command parameter defaults to the /usr/bin/sh file. If the Command parameter is not null, it specifies the command to be executed. If the Mode parameter contains the **PENV_ARGV** value, the *Command* parameter is assumed to be in the argy structure and is passed to the execve subroutine. The string contained in the Command parameter is used as the Path parameter of the execve subroutine. If the *Mode* parameter does not contain PENV_ARGV value, the Command parameter is parsed into an argy structure and executed. If the Command parameter contains the \$SHELL value, substitution is done prior to execution.

Note: This step will fail if the Command parameter contains the \$SHELL value but the user-state environment does not contain the SHELL value.

Parameters

Command

Specifies the command to be executed. If the Mode parameter contains the PENV_ARGV value, then the Command parameter is assumed to be a valid argument vector for the execv subroutine.

Specifies the value of user-state and system-state environment variables in the same format returned by the **getpenv** subroutine. The user-state variables are prefaced by the keyword USRENVIRON:, and the system-state variables are prefaced by the keyword SYSENVIRON:. Each variable is defined by a string of the form var=value, which is an array of null-terminated character pointers.

Mode Specifies how the **setpenv** subroutine is to set the environment and run the command. This parameter is a bit mask and must contain only one of the following values, which are defined in the usersec.h file:

PENV INIT

The user-state environment is initialized as follows:

AUTHSTATE

Retained from the current environment. If the AUTHSTATE value is not present, it is defaulted to the compat value.

KRB5CCNAME

Retained from the current environment. This value is defined if you authenticated through the Distributed Computing Environment (DCE).

USER Set to the name specified by the *User* parameter or to the name corresponding to the current real user ID. The name is shortened to a maximum of PW USERNAME LEN, including the trailing NUL character. PW_USERNAME_LEN is the running system's maximum value. The value of PW_USERNAME_LEN can be at the most MAXIMPL_LOGIN_NAME_MAX (or

256 characters), and must be at least 9 characters.

LOGIN

Set to the name specified by the *User* parameter or to the name corresponding to the current real user ID. If set by the *User* parameter, this value is the complete login name, which may include a DCE cell name.

LOGNAME

Set to the current system environment variable **LOGNAME**.

TERM Retained from the current environment. If the **TERM** value is not present, it is defaulted to an IBM6155.

SHELL

Set from the initial program defined for the real user ID of the current process. If no program is defined, then the /usr/bin/sh shell is used as the default.

HOME Set from the home directory defined for the real user ID of the current process. If no home directory is defined, the default is /home/guest.

Set initially to the value for the **PATH** value in the **/etc/environment** file. If not set, it is destructively replaced by the default value of PATH=/usr/bin:\$HOME:. (The final period specifies the working directory). The **PATH** variable is destructively replaced by the usrenv attribute for this user in the /etc/security/environ file if the **PATH** value exists in the /etc/environment file.

The following files are read for additional environment variables:

/etc/environment

Variables defined in this file are added to the environment.

/etc/security/environ

Environment variables defined for the user in this file are added to the user-state environment.

The user-state variables in the *Environment* parameter are added to the user-state environment. These are preceded by the **USRENVIRON:** keyword.

The system-state environment is initialized as follows:

LOGNAME

Set to the current **LOGNAME** value in the protected user environment. The **login** (tsm) command passes this value to the setpenv subroutine to ensure correctness.

NAME Set to the login name corresponding to the real user ID.

Set to the TTY name corresponding to standard input.

The following file is read for additional environment variables:

/etc/security/environ

The system-state environment variables defined for the user in this file are added to the environment. The system-state variables in the Environment parameter are added to the environment. These are preceded by the SYSENVIRON keyword.

PENV DELTA

The existing user-state and system-state environment variables are preserved and the variables defined in the *Environment* parameter are added.

PENV RESET

The existing environment is cleared and totally replaced by the content of the Environment parameter.

PENV KLEEN

Closes all open file descriptors, except 0, 1, and 2, before executing the command. This value must be logically ORed with PENV DELTA, PENV RESET, or PENV INIT. It cannot be used alone.

PENV NOPROF

The new shell will not be treated as a login shell. Only valid when used with the PENV_INIT flag.

For both system-state and user-state environments, variable substitution is performed.

The *Mode* parameter may also contain:

PENV_ARGV

Specifies that the Command parameter is already in argy format and need not be parsed. This value must be logically ORed with PENV_DELTA, PENV_RESET, or PENV_INIT. It cannot be used alone

User

Specifies the user name whose environment and working directory is to be set and the specified command run. If a null pointer is given, the current real uid is used to determine the name of the user.

Return Values

If the environment was successfully established, this function does not return. If the setpenv subroutine fails, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The setpenv subroutine fails if one or more of the following are true:

EINVAL The Mode parameter contains values other than PENV INIT, PENV DELTA, PENV RESET, or

PENV ARGV.

EINVAL The Mode parameter contains more than one of PENV_INIT, PENV_DELTA, or PENV_RESET values.

EINVAL The Environment parameter is neither null nor empty, and does not contain a valid environment string.

EPERM The caller does not have read access to the environment defined for the system, or the user does not have permission to change the specified attributes.

Other errors may be set by subroutines invoked by the **setpenv** subroutine.

Related Information

The exect, execve, execve, execve, execvp, or exect subroutine, getpenv subroutine, setpcred ("setpcred Subroutine" on page 183) subroutine.

List of Security and Auditing Subroutines, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setpgid or setpgrp Subroutine

Purpose

Sets the process group ID.

Libraries

```
setpgid: Standard C Library (libc.a)
setpgrp: Standard C Library (libc.a);
```

Berkeley Compatibility Library (libbsd.a)

Syntax

```
#include <unistd.h>
pid t setpgid ( ProcessID, ProcessGroupID)
pid_t ProcessID, ProcessGroupID;
pid t setpgrp ( )
```

Description

The setpgid subroutine is used either to join an existing process group or to create a new process group within the session of the calling process. The process group ID of a session leader does not change. Upon return, the process group ID of the process having a process ID that matches the *ProcessID* value is set to the *ProcessGroupID* value. As a special case, if the *ProcessID* value is 0, the process ID of the calling process is used. If ProcessGroupID value is 0, the process ID of the indicated process is used.

This function is implemented to support job control.

The **setpgrp** subroutine in the **libc.a** library supports a subset of the function of the **setpgid** subroutine. It has no parameters. It sets the process group ID of the calling process to be the same as its process ID and returns the new value.

In BSD systems, the **setpgrp** subroutine is defined with two parameters, as follows:

```
pid_t setpgrp (ProcessID, ProcessGroup)
pid_t ProcessID, ProcessGroup;
```

Parameters

ProcessID Specifies the process whose process group ID is to be changed.

ProcessGroupID Specifies the new value of calling process group ID.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **setpgid** subroutine is unsuccessful if one or more of the following is true:

EACCES The value of the *ProcessID* parameter matches the process ID of a child process of the calling process

and the child process has successfully executed one of the exec subroutines.

EINVAL The value of the *ProcessGroupID* parameter is less than 0, or is not a valid value.

ENOSYS The **setpgid** subroutine is not supported by this implementation.

EPERM The process indicated by the value of the *ProcessID* parameter is a session leader.

EPERM The value of the *ProcessID* parameter matches the process ID of a child process of the calling process

and the child process is not in the same session as the calling process.

EPERM The value of the ProcessGroupID parameter is valid, but does not match the process ID of the process

indicated by the *ProcessID* parameter. There is no process with a process group ID that matches the

value of the *ProcessGroupID* parameter in the same session as the calling process.

ESRCH The value of the *ProcessID* parameter does not match the process ID of the calling process of a child

process of the calling process.

Related Information

The **getpid** subroutine.

setpri Subroutine

Purpose

Sets a process scheduling priority to a constant value.

Library

Standard C Library (libc.a)

Syntax

#include <sys/sched.h>

int setpri (ProcessID, Priority) pid t ProcessID; int Priority;

Description

The setpri subroutine sets the scheduling priority of all threads in a process to be a constant. All threads have their scheduling policies changed to **SCHED RR**. A process nice value and CPU usage can no longer be used to determine a process scheduling priority. Only processes that have root user authority can set a process scheduling priority to a constant.

Parameters

ProcessID Specifies the process ID. If this value is 0 then the current process scheduling priority is set to a

constant.

Priority Specifies the scheduling priority for the process. A lower number value designates a higher

scheduling priority. The *Priority* parameter must be in the range **PRIORITY_MIN** < *Priority* <

PRIORITY_MAX. (See the sys/sched.h file.)

Return Values

Upon successful completion, the setpri subroutine returns the former scheduling priority of the process just changed. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **setpri** subroutine is unsuccessful if one or more of the following is true:

EINVAL The priority specified by the *Priority* parameter is outside the range of acceptable priorities.

EPERM The process executing the **setpri** subroutine call does not have root user authority. No process can be found corresponding to that specified by the *ProcessID* parameter. **ESRCH**

Related Information

The getpri subroutine.

Performance-related subroutines in Performance management.

setpwdb or endpwdb Subroutine

Purpose

Opens or closes the authentication database.

Library

Security Library (libc.a)

Syntax

```
#include <userpw.h>
int setpwdb ( Mode)
int Mode;
int endpwdb ( )
```

Description

These functions are used to open and close access to the authentication database. Programs that call either the **getuserpw** or **putuserpw** subroutine should call the **setpwdb** subroutine to open the database and the **endpwdb** subroutine to close the database.

The **setpwdb** subroutine opens the authentication database in the specified mode, if it is not already open. The open count is increased by 1.

The **endpwdb** subroutine decreases the open count by one and closes the authentication database when this count drops to 0. Subsequent references to individual data items can cause a memory access violation. The **endpwdb** subroutine also frees the space that was allocated by either the **getuserpw**, putuserpw, or putuserpwhist subroutine. For security reasons, freeing the space clears the password field. Any uncommitted changed data is lost.

Parameters

Mode

Specifies the mode of the open. This parameter may contain one or more of the following values, defined in the usersec.h file:

```
S READ
```

Specifies read access.

S_WRITE

Specifies update access.

Return Values

The setpwdb and endpwdb subroutines return a value of 0 to indicate success. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **setpwdb** and **endpwdb** subroutines fail if the following is true:

Access permission is denied for the data request.

Both of these functions return errors from other subroutines.

Security

Access Control: The calling process must have access to the authentication data.

Files Accessed:

Modes File

/etc/security/passwd rw

rw /etc/passwd

setroledb or endroledb Subroutine

Purpose

Opens and closes the role database.

Library

Security Library (libc.a)

Syntax

#include <usersec.h> int setroledb(Mode) int Mode; int endroledb

Description

These functions may be used to open and close access to the role database. Programs that call the getroleattr subroutine should call the setroledb subroutine to open the role database and the endroledb subroutine to close the role database.

The **setroledb** subroutine opens the role database in the specified mode, if it is not already open. The open count is increased by 1.

The endroledb subroutine decreases the open count by 1 and closes the role database when this count goes to 0. Any uncommitted changed data is lost.

Parameters

Mode

Specifies the mode of the open. This parameter may contain one or more of the following values defined in the usersec.h file:

S READ

Specifies read access.

S WRITE

Specifies update access.

Return Values

The setroledb and endroledb subroutines return a value of 0 to indicate success. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **setroledb** subroutine fails if the following is true:

EACCES Access permission is denied for the data request.

Both subroutines return errors from other subroutines.

Security

Files Accessed: The calling process must have access to the role data.

Mode File rw/etc/security/roles

Related Information

The getroleattr, nextrole, or putroleattr subroutine.

setsid Subroutine

Purpose

Creates a session and sets the process group ID.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h> pid_t setsid (void)

Description

The **setsid** subroutine creates a new session if the calling process is not a process group leader. Upon return, the calling process is the session leader of this new session, the process group leader of a new process group, and has no controlling terminal. The process group ID of the calling process is set equal to its process ID. The calling process is the only process in the new process group and the only process in the new session.

Return Values

Upon successful completion, the value of the new process group ID is returned. Otherwise, (pid_t) -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **setsid** subroutine is unsuccessful if the following is true:

The calling process is already a process group leader, or the process group ID of a process other than the calling process matches the process ID of the calling process.

Related Information

The fork subroutine, getpid, getpgrp, or getppid subroutine, setpgid ("setpgid or setpgrp Subroutine" on page 189) subroutine, setpgrp ("setpgid or setpgrp Subroutine" on page 189) subroutine.

setuid, setruid, seteuid, setreuid or setuidx Subroutine

Purpose

Sets the process user IDs.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
int setuid (UID)
uid t UID;
int setruid (RUID)
uid t RUID;
int seteuid (EUID)
uid_t EUID;
int setreuid (RUID, EUID)
uid t RUID;
uid t EUID;
#include <unistd.h>
#include <sys/id.h>
int setuidx (which, UID)
int which;
uid_t UID;
```

Description

The setuid, setruid, seteuid, and setreuid subroutines reset the process user IDs. The following semantics are supported:

setuid If the effective user ID of the process is the root user, the process's real, effective, and saved user

IDs are set to the value of the UID parameter. Otherwise, the process effective user ID is reset if the

UID parameter specifies either the current real or saved user IDs.

seteuid The process effective user ID is reset if the UID parameter is equal to either the current real or saved

user IDs or if the effective user ID of the process is the root user.

The EPERM error code is always returned. Processes cannot reset only their real user IDs. setruid

setreuid

The RUID and EUID parameters can have the following two possibilities:

RUID != EUID

If the EUID parameter specifies either the process's real or saved user IDs, the process effective user ID is set to the EUID parameter. Otherwise, the EPERM error code is

RUID== EUID

If the process effective user ID is the root user, the process's real and effective user IDs are set to the *EUID* parameter. Otherwise, the **EPERM** error code is returned.

If both the real user ID and effective user ID are changed, the saved user ID is set to the new effective user ID. Note that this change results in a loss of original privileges.

setuidx

The setuidx subroutine does not modify the privileges of the process after the user ID of the process has been modified. To modify the privileges and the user ID of a process, use the setpriv subroutine and the setuidx subroutine together.

The which parameter can have one of the following values:

ID EFFECTIVE

UID must be either the real or saved user ID. The effective user ID for the current process will be set to UID.

ID_EFFECTIVEIID_REAL

Invoker must have appropriate privilege. The real and effective user ID for the current process will be set to UID.

ID EFFECTIVEIID REALIID SAVED

Invoker must have appropriate privilege. The real, effective and saved user ID for the current process will be set to UID.

ID LOGIN

Invoker must have appropriate privilege. The login user ID for the current process will be set to UID.

The real and effective user ID parameters can have a value of -1. If the value is -1, the actual value for the *UID* parameter is set to the corresponding current the *UID* parameter of the process.

The operating system does not support setuid or setgid ("setgid, setrgid, setegid, setregid, or setgidx Subroutine" on page 175) shell scripts.

These subroutines are part of Base Operating System (BOS) Runtime.

Parameters

UID Specifies the user ID to set. EUID Specifies the effective user ID to set. RUID Specifies the real user ID to set. which Specifies which user ID values to set.

Return Values

Upon successful completion, the **setuid**, **seteuid**, **setreuid**, and **setuidx** subroutines return a value of 0. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **setuid**, **seteuid**, **setreuid**, and **setuidx** subroutines are unsuccessful if either of the following is true:

EINVAL The value of the *UID* or *EUID* parameter is not valid. **EPERM**

The process does not have the appropriate privileges and the UID and EUID parameters are not equal to either the real or saved user IDs of the process.

Examples

The following example shows using the **setuidx** and **setpriv** subroutines together:

```
#include <sys/id.h>
#include <sys/priv.h>
int main(void) {
   int uid=206;
  priv_t priv;
  bzero(priv.pv priv, sizeof(priv.pv priv));
   if (setuidx(ID EFFECTIVE|ID REAL|ID SAVED|ID LOGIN, uid) < 0) {
     perror("setuidx error");
      exit(errno);
   if(setpriv(PRIV SET|PRIV INHERITED|PRIV EFFECTIVE|PRIV BEQUEATH, &priv, sizeof(priv t))<0) {
     perror("setpriv error");
     exit(errno);
   }
  exit (0);
```

Related Information

The getuid or geteuid subroutine, setgid ("setgid, setrgid, setregid, setregid, or setgidx Subroutine" on page 175) subroutine.

List of Security and Auditing Subroutines and Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setuserdb or enduserdb Subroutine

Purpose

Opens and closes the user database.

Library

Security Library (libc.a)

Syntax

```
#include <usersec.h>
int setuserdb ( Mode)
int Mode;
int enduserdb ( )
```

Description

These functions may be used to open and close access to the user database. Programs that call either the getuserattr or getgroupattr subroutine should call the setuserdb subroutine to open the user database and the **enduserdb** subroutine to close the user database.

The **setuserdb** subroutine opens the user database in the specified mode, if it is not already open. The open count is increased by 1.

The enduserdb subroutine decreases the open count by 1 and closes the user database when this count goes to 0. Any uncommitted changed data is lost.

Parameters

Mode

Specifies the mode of the open. This parameter may contain one or more of the following values defined in the usersec.h file:

S READ

Specifies read access

S WRITE

Specifies update access.

Return Values

The **setuserdb** and **enduserdb** subroutines return a value of 0 to indicate success. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **setuserdb** subroutine fails if the following is true:

EACCES Access permission is denied for the data request.

Both subroutines return errors from other subroutines.

Security

Files Accessed: The calling process must have access to the user data. Depending on the actual attributes accessed, this may include:

Modes File rw /etc/passwd /etc/group rw rw /etc/security/user /etc/security/limits rw rw /etc/security/group /etc/security/environ rw

Related Information

The getgroupattr subroutine, getuserattr subroutine, getuserpw subroutine, setpwdb ("setpwdb or endpwdb Subroutine" on page 191) subroutine.

List of Security and Auditing Subroutines and Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sgetl or sputl Subroutine

Purpose

Accesses long numeric data in a machine-independent fashion.

Library

Object File Access Routine Library (libld.a)

Syntax

```
long sget1 ( Buffer)
char *Buffer;
void sputl (Value, Buffer)
long Value;
char *Buffer;
```

Description

The **sgetI** subroutine retrieves four bytes from memory starting at the location pointed to by the Buffer parameter. It then returns the bytes as a long Value with the byte ordering of the host machine.

The **sput!** subroutine stores the four bytes of the *Value* parameter into memory starting at the location pointed to by the Buffer parameter. The order of the bytes is the same across all machines.

Using the sputI and sgetI subroutines together provides a machine-independent way of storing long numeric data in an ASCII file. For example, the numeric data stored in the portable archive file format can be accessed with the sput! and sget! subroutines.

Parameters

Value Specifies a 4-byte value to store into memory.

Buffer Points to a location in memory.

Related Information

The ar command, dump command.

The ar file format, a.out file format.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

shm open Subroutine

Purpose

Opens a shared memory object.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/mman.h>
int shm open (name, oflag, mode)
const char *name;
int oflag;
mode t mode;
```

Description

The shm_open subroutine establishes a connection between a shared memory object and a file descriptor. It creates an open file description that refers to the shared memory object and a file descriptor that refers to that open file description. This file descriptor is used by other subroutines to refer to that shared memory object.

The name parameter points to a string naming a shared memory object. The name parameter does not appear in the file system and is not visible to other subroutines that take pathnames as arguments. The name parameter must conform to the construction rules for a pathname.

If successful, the **shm open** subroutine returns a file descriptor for the shared memory object that is the lowest numbered file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor does not share it with any other processes. The FD_CLOEXEC file descriptor flag associated with the new file descriptor is set.

The file status flags and file access modes of the open file description are according to the value of the oflag parameter. The oflag parameter is the bitwise-inclusive OR of the following flags defined in the fcntl.h header file.

Parameters

Points to a string naming a shared memory object. name

oflag Specifies the flags to be used by the **shm_open** subroutine. Sets the value of the permission bits of the shared memory object. mode

Read-Write Flags

Applications specify exactly one of the first two values (access modes) below in the value of the oflag parameter:

O_RDONLY Open for read access only. O_RDWR Open for read or write access.

Other Flags

Any combination of the remaining flags may be specified in the value of the *oflag* parameter:

O CREAT If the shared memory object exists, this flag has no effect, except as noted under the

> O_EXCL flag below. Otherwise, the shared memory object is created, the user ID of the shared memory object is set to the effective user ID of the process, and the group ID of the shared memory object is set to the effective group ID of the process. The permission bits of the shared memory object are set to the value of the *mode* parameter except those set in the file mode creation mask of the process. Only the low-order 9 bits of the mode parameter are taken into account. The shared memory

object has a size of zero.

O_EXCL If the O EXCL and O CREAT flags are set, the shm open subroutine fails if the

shared memory object exists. The O EXCL flag is ignored if the O CREAT flag is not

O TRUNC If the shared memory object exists and it is successfully opened, the O_RDWR flag,

the object is truncated to zero length, and the mode and owner is unchanged by the

shm_open call.

Return Values

Upon successful completion, the **shm_open** subroutine returns a non-negative integer representing the lowest numbered unused file descriptor. If unsuccessful, it returns -1 and sets errno to indicate the error.

Error Codes

EEXIST

EACCES The shared memory object exists and the permissions specified by the oflag parameter are

> denied, or the shared memory object does not exist and permission to create the shared memory object is denied, or the O_TRUNC flag is specified and write permission is denied.

The O_CREAT and O_EXCL flags are set and the named shared memory object already

exists.

EINVAL The **shm** open subroutine is not supported for an empty name string, or the *name* parameter

is missing, or the oflag parameter contains an invalid value.

EFAULT The *name* parameter points outside of the allocated address space of the process.

EMFILE Too many file descriptors are currently in use by this process.

The length of the name parameter exceeds PATH_MAX or a pathname component is longer **ENAMETOOLONG**

than NAME_MAX.

ENFILE Too many shared memory objects are currently open in the system.

ENOENT The O CREAT flag is not set and the named shared memory object does not exist.

ENOMEM The system is unable to allocate resources.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed. **ENOSPC** There is insufficient space for the creation of the new shared memory object

shm_unlink Subroutine

Purpose

Removes a shared memory object.

Library

Standard C Library (libc.a)

Syntax

#include <sys/mman.h>

int shm unlink (name) const char *name;

Description

The **shm_unlink** subroutine removes the name of the shared memory object named by the string pointed to by the *name* parameter.

If one or more references to the shared memory object exist when the object is unlinked, the name is removed before the shm_unlink subroutine returns, but the removal of the memory object contents is postponed until all open and map references to the shared memory object have been removed.

Even if the object continues to exist after the last **shm unlink** call, reuse of the name subsequently causes the shm open subroutine to behave as if no shared memory object of this name exists. In other words, the shm_open subroutine will fail if O_CREAT is not set, or will create a new shared memory object if O_CREAT is set.

Parameters

name Specifies the name of the shared memory object to be unlinked.

Return Values

Upon successful completion, zero is returned. Otherwise, -1 is returned and errno is set to indicate the error. If -1 is returned, the named shared memory object is not changed by the subroutine call.

Error Codes

The shm unlink subroutine fails if:

EACCES Permission is denied to unlink the named shared memory object.

EFAULT The *name* parameter points outside of the allocated address space of the process.

EINVAL The name parameter is an empty name string, or is missing.

ENAMETOOLONG The length of the *name* parameter exceeds **PATH_MAX** or a pathname component is

longer than NAME_MAX.

ENOENT The named shared memory object does not exist.

ENOTSUP This function is not supported with processes that have been checkpoint-restart'ed.

shmat Subroutine

Purpose

Attaches a shared memory segment or a mapped file to the current process.

Library

Standard C Library (libc.a)

Syntax

#include <sys/shm.h>

void *shmat (SharedMemoryID, SharedMemoryAddress, SharedMemoryFlag) int SharedMemoryID, SharedMemoryFlag; const void * SharedMemoryAddress;

Description

The **shmat** subroutine attaches the shared memory segment or mapped file specified by the SharedMemoryID parameter (returned by the shmget subroutine), or file descriptor specified by the SharedMemoryID parameter (returned by the openx subroutine) to the address space of the calling process.

A call to the **shmat** subroutine on a file descriptor that identifies an open shared memory object fails with

To learn more about the limits that apply to shared memory, see the Inter-Process Communication (IPC) Limits article in AIX 5L Version 5.3 General Programming Concepts.

Note: The following applies to AIX 4.2.1 and later releases for 32-bit processes only.

An extended shmat capability is available. If an environment variable EXTSHM=ON is defined then processes executing in that environment will be able to create and attach more than eleven shared memory segments.

The segments can be of size from 1 byte to 2GB. The process can attach segments larger than 256MB into the address space for the size of the segment. Another segment could be attached at the end of the first one in the same 256MB segment region. The address at which a process can attach is at page boundaries - a multiple of SHMLBA EXTSHM bytes. For segments larger than 256MB in size, if **EXTSHM=ON** is not defined, the address at which a process can attach is at 256MB boundaries, which is a multiple of **SHMLBA** bytes.

The segments can be of size from 1 byte to 256MB. The process can attach these segments into the address space for the size of the segment. Another segment could be attached at the end of the first one in the same 256MB segment region. The address at which a process can attach will be at page boundaries - a multiple of SHMLBA EXTSHM bytes.

The maximum address space available for shared memory with or without the environment variable and for memory mapping is 2.75GB. An additional segment register "0xE" is available so that the address space is from 0x30000000 to 0xE0000000. However, a 256MB region starting from 0xD0000000 will be used by the shared libraries and is therefore unavailable for shared memory regions or *mmap*ped regions.

On AIX 5.2 and later, a 32-bit process running with the very large address space model has up to 3.25 GB of address space available for the **shmat** and **mmap** memory mappings. For a 32-bit process with the very large address space model, the address space available for mappings is from 0x30000000 to 0xFFFFFFF. This extended address range applies to both extended shmat and standard shmat. For more information on how to use the very large address space model, see the Understanding the Very Large Address-Space Model article in AIX 5L Version 5.3 General Programming Concepts.

There are some restrictions on the use of the extended shmat feature. These shared memory regions can not be used as I/O buffers where the unpinning of the buffer occurs in an interrupt handler. The restrictions on the use are the same as that of *mmap* buffers.

The smaller region sizes are not supported for mapping files. Regardless of whether **EXTSHM=ON** or not, mapping a file will consume at least 256MB of address space.

The SHM SIZE shmctl command is not supported for segments created with EXTSHM=ON.

A segment created with EXTSHM=ON can be attached by a process without EXTSHM=ON. This will consume an area of address space that is a multiple of 256MB in size, regardless of the size of the shared memory region.

A segment created without EXTSHM=ON can be attached by a process with EXTSHM=ON. This will consume an area of address space that is a multiple of 256MB in size, regardless of the size of the shared memory region.

The environment variable provides the option of executing an application either with the additional functionality of attaching more than 11 segments when **EXTSHM=ON**, or the higher-performance access to 11 or fewer segments when the environment variable is not set.

The EXTSHM environment variable supports two additional values, EXTSHM=1SEG and **EXTSHM=MSEG**. All three options let users create more than 11 segments.

The EXTSHM=1SEG option defaults to the same behavior as EXTSHM=ON, which is to make memory mapped segments (type MMAP) of shared memories less than 256 MB, and SHMAT'ed segments (type WORKING) of shared memories greater than or equal to 256 MB. The EXTSHM=MSEG option creates memory mapped segments of all shared memories, regardless of size. This option provides better use of memory space.

Parameters

SharedMemoryID

Specifies an identifier for the shared memory segment.

SharedMemoryAddress Identifies the segment or file attached at the address specified by the SharedMemoryAddress parameter, as follows:

- If the SharedMemoryAddress parameter is not equal to 0, and the SHM_RND flag is set in the SharedMemoryFlag parameter, the segment or file is attached at the next lower segment boundary. This address is given by (SharedMemoryAddress -(SharedMemoryAddress modulo SHMLBA EXTSHM if environment variable EXTSHM=ON or SHMLBA if not). SHMLBA specifies the low boundary address multiple of a segment.
- If the SharedMemoryAddress parameter is not equal to 0 and the SHM RND flag is not set in the SharedMemoryFlag parameter, the segment or file is attached at the address given by the SharedMemoryAddress parameter. If this address does not point to a SHMLBA EXTSHM boundary if the environment variable EXTSHM=ON or SHMLBA boundary if not, the shmat subroutine returns the value -1 and sets the errno global variable to the EINVAL error code. SHMLBA specifies the low boundary address multiple of a segment.

SharedMemorvFlag

Specifies several options. Its value is either 0 or is constructed by logically ORing one or more of the following values:

SHM COPY

Changes an open file to deferred update (see the openx subroutine). Included only for compatibility with previous versions of the operating system.

SHM MAP

Maps a file onto the address space instead of a shared memory segment. The SharedMemoryID parameter must specify an open file descriptor in this case.

SHM RDONLY

Specifies read-only mode instead of the default read-write mode.

SHM RND

Rounds the address given by the SharedMemoryAddress parameter to the next lower segment boundary, if necessary.

The shmat subroutine makes a shared memory segment addressable by the current process. The segment is attached for reading if the SHM RDONLY flag is set and the current process has read permission. If the SHM RDONLY flag is not set and the current process has both read and write permission, it is attached for reading and writing.

If the SHM MAP flag is set, file mapping takes place. In this case, the shmat subroutine maps the file open on the file descriptor specified by the SharedMemoryID onto a segment. The file must be a regular file. The segment is then mapped into the address space of the process. A file of any size can be mapped if there is enough space in the user address space.

When file mapping is requested, the SharedMemoryFlag parameter specifies how the file should be mapped. If the SHM_RDONLY flag is set, the file is mapped read-only. To map read-write, the file must have been opened for writing.

All processes that map the same file read-only or read-write map to the same segment. This segment remains mapped until the last process mapping the file closes it.

A mapped file opened with the **O_DEFER** update has deferred update. That is, changes to the shared segment do not affect the contents of the file resident in the file system until an fsync subroutine is issued to the file descriptor for which the mapping was requested. Setting the SHM_COPY flag changes the file to the deferred state. The file remains in this state until all processes close it. The SHM COPY flag is provided only for compatibility with Version 2 of the operating system. New programs should use the O DEFER open flag.

A file descriptor can be used to map the corresponding file only once. To map a file several times requires multiple file descriptors.

When a file is mapped onto a segment, the file is referenced by accessing the segment. The memory paging system automatically takes care of the physical I/O. References beyond the end of the file cause the file to be extended in page-sized increments. The file cannot be extended beyond the next segment boundary.

Attention: When a file is mapped, use of standard file system calls, such as truncate and write, are discouraged and might produce unexpected results, especially in a multithreaded environment. In particular, the write system call, upon completion, sets the size to the new end-of-file. Any shmat changes that occur concurrently past this new end-of-file might be lost. Concurrent change of the mapped region and use of the write system call are highly discouraged.

Return Values

When successful, the segment start address of the attached shared memory segment or mapped file is returned. Otherwise, the shared memory segment is not attached, the errno global variable is set to indicate the error, and a value of -1 is returned.

Error Codes

The shmat subroutine is unsuccessful and the shared memory segment or mapped file is not attached if one or more of the following are true:

EACCES The calling process is denied permission for the specified operation.

EAGAIN The file to be mapped has enforced locking enabled, and the file is currently locked.

EBADF A file descriptor to map does not refer to an open regular file.

EEXIST The file to be mapped has already been mapped.

EINVAL The SHM_RDONLY and SHM_COPY flags are both set.

EINVAL The **shmat** subroutine was used with a file descriptor obtained from a call to the **shm_open** subroutine.

EINVAL The SharedMemoryID parameter is not a valid shared memory identifier.

EINVAL The SharedMemoryAddress parameter is not equal to 0, and the value of (SharedMemoryAddress -

(SharedMemoryAddress modulo SHMLBA_EXTSHM if the environment variable EXTSHM=ON or

SHMLBA if not) points outside the address space of the process.

EINVAL The SharedMemoryAddress parameter is not equal to 0, the SHM_RND flag is not set in the

SharedMemoryFlag parameter, and the SharedMemoryAddress parameter points to a location outside of

the address space of the process.

EMFILE The number of shared memory segments attached to the calling process exceeds the system-imposed

The available data space in memory is not large enough to hold the shared memory segment. ENOMEM **ENOMEM**

is always returned if a 32-bit process tries to attach a shared memory segment larger than 2GB.

ENOMEM The available data space in memory is not large enough to hold the mapped file data structure.

shmctl Subroutine

Purpose

Controls shared memory operations.

Library

Standard C Library (libc.a)

Syntax

#include <sys/shm.h>

```
int shmctl (SharedMemoryID, Command, Buffer)
int SharedMemoryID, Command;
struct shmid_ds * Buffer;
```

Description

The **shmctl** subroutine performs a variety of shared-memory control operations as specified by the Command parameter.

The following limits apply to shared memory:

- Maximum shared-memory segment size is:
 - 256M bytes before AIX 4.3.1
 - 2G bytes for AIX 4.3.1 through AIX 5.1
 - 64G bytes for 64-bit applications for AIX 5.1 and later
- · Minimum shared-memory segment size is 1 byte.
- Maximum number of shared memory IDs is 4096 for operating system releases before AIX 4.3.2 and 131072 for AIX 4.3.2 and following.

Parameters

SharedMemoryID Buffer

Specifies an identifier returned by the **shmget** subroutine.

Indicates a pointer to the shmid_ds structure. The shmid_ds structure is defined in the

sys/shm.h file.

Command

The following commands are available:

IPC_STAT

Obtains status information about the shared memory segment identified by the SharedMemoryID parameter. This information is stored in the area pointed to by the Buffer parameter. The calling process must have read permission to run this command. The shm pagesize and shm 1ba fields of the **shmid_ds** data structure pointed to by the Buffer parameter are not updated by this command.

IPC_SET

Sets the user and group IDs of the owner as well as the access permissions for the shared memory segment identified by the SharedMemoryID parameter. This command sets the following fields:

```
shm_perm.uid /* owning user ID
shm perm.gid /* owning group ID
shm perm.mode /* permission bits only */
```

You must have an effective user ID equal to root or to the value of the shm perm.cuid or shm perm.uid field in the shmid_ds data structure identified by the SharedMemoryID parameter.

IPC_RMID

Removes the shared memory identifier specified by the SharedMemoryID parameter from the system and erases the shared memory segment and data structure associated with it. This command is only executed by a process that has an effective user ID equal either to that of superuser or to the value of the shm perm.uid or shm perm.cuid field in the data structure identified by the SharedMemoryID parameter.

SHM SIZE

Sets the size of the shared memory segment to the value specified by the shm segsz field of the structure specified by the Buffer parameter. This value can be larger or smaller than the current size. The limit is the maximum shared-memory segment size. This command is only executed by a process that has an effective user ID equal either to that of a process with the appropriate privileges or to the value of the shm perm.uid or shm perm.cuid field in the data structure identified by the SharedMemoryID parameter. This command is not supported for regions created with the environment variable EXTSHM=ON. This results in a return value of -1 with errno set to EINVAL. Attempting to use the SHM SIZE on a shared memory region larger than 256MB or attempting to increase the size of a shared memory region larger than 256MB results in a return value of -1 with errno set to EINVAL.

SHM_PAGESIZE

Sets the page size backing the shared memory segment identified by the SharedMemoryID parameter. This command will set the page size backing the specified shared memory segment to the value of the shm pagesize field of the shmid ds structure specified by the Buffer parameter. The shm pagesize field is interpreted as a page size in bytes. This command can only be used by a process that has an effective user ID with permissions set equal either to that of superuser or to the value of the shm perm.uid or shm perm.cuid field in the **shmid_ds** data structure identified by the SharedMemoryID parameter. In order to change the page size backing a shared memory segment, this command must be used on the shared memory segment immediately after it has been created and before any process has attached to the shared memory segment. Also, this command must be used before pinning the pages in a shared memory segment. Thus, this command cannot be used with shared memory segments that have been created with the SHM_PIN flag or shared memory segments that have been pinned with the SHM_LOCK shmctl() command. This command cannot be used with shared memory regions created with the **EXTSHM=ON** environment variable. Note: A system's supported page sizes can be gueried by specifying the

VM_GETPSIZES command to the vmgetinfo() system call.

Command continued

The following commands are available:

SHM LOCK

Pins all of the pages in the shared memory segment identified by the SharedMemoryID parameter. Pinning the pages in a shared memory segment will ensure that page faults do not occur for memory references to the shared memory region. This command can only be used by a process that has an effective user ID equal to that of superuser or to the value of the shm_perm.uid or shm_perm.cuid field in the shmid_ds data structure identified by the SharedMemoryID parameter. A non-superuser user must also have the CAP_BYPASS_RAC_VMM capability in order to use this command. This command cannot be used with shared memory regions created with the EXTSHM=ON environment variable or shared memory regions created with the SHM_PIN flag. The Buffer parameter must be set to NULL when using this command.

SHM_UNLOCK

Unpins all of the pages in the shared memory segment identified by the SharedMemoryID parameter. This command can only be used by a process that has an effective user ID equal either to that of superuser or to the value of the shm perm.uid or shm perm.cuid field in the **shmid_ds** data structure identified by the SharedMemoryID parameter. This command will fail if called on shared memory segments created with the SHM_PIN flag. Also, this command can only be used when the specified shared memory segment is not attached by any process, and there is no outstanding I/O to the shared memory segment. The Buffer parameter must be set to NULL when using this command.

SHM_GETLBA

Obtains the minimum alignment of the address at which the shared memory segment identified by the SharedMemoryID parameter can be attached by the shmat() subroutine. This command will store the minimum alignment in the shm 1ba field of the shmid_ds struct pointed to by the Buffer parameter. The alignment is reported in bytes. The calling process must have read permission to a shared memory region in order to use this command.

Return Values

When completed successfully, the shmctl subroutine returns a value of 0. Otherwise, it returns a value of -1 and the **errno** global variable is set to indicate the error.

Error Codes

The **shmctl** subroutine is unsuccessful if one or more of the following are true:

EACCES The Command parameter is equal to the IPC STAT or SHM GETLBA value and read

permission is denied to the calling process.

EFAULT The Buffer parameter points to a location outside the allocated address space of the

EINVAL The SharedMemoryID parameter is not a valid shared memory identifier.

EINVAL The Command parameter is not a valid command.

The Command parameter is equal to the SHM SIZE value and the value of the shm segsz **EINVAL**

field of the structure specified by the Buffer parameter is not valid.

EINVAL The Command parameter is equal to the SHM_SIZE, SHM_PAGESIZE, or SHM_LOCK

value and the shared memory region was created with the environment variable

EXTSHM=ON.

EINVAL The Command parameter is equal to the SHM_PAGESIZE value and the value of the

shm pagesize field of the structure specified by the Buffer parameter is not supported.

The Command parameter is equal to SHM UNLOCK, and the specified shared memory **EINVAL**

segment was not previously locked by a SHM_LOCK operation.

The Command parameter is equal to SHM_LOCK or SHM_UNLOCK, and the Buffer **EINVAL**

parameter is not **NULL**.

ENOMEM The Command parameter is equal to the SHM_SIZE value, and the attempt to change the

segment size is unsuccessful because the system does not have enough memory.

ENOMEM The Command parameter is SHM_LOCK, and locking the pages in the specified shared

memory segment would exceed the limit on the amount of memory the calling process

may lock.

ENOMEM The Command parameter is SHM_PAGESIZE, and there are insufficient pages of the

specified page size to back the entire shared memory segment.

The Command parameter is IPC STAT and the size of the shared memory region is **EOVERFLOW**

greater than or equal to 4G bytes. This only happens with 32-bit programs.

EPERM The Command parameter is IPC RMID, SHM SIZE, SHM PAGESIZE, SHM LOCK, or

> SHM_UNLOCK, and the effective user ID of the calling process is not equal to the value of the shm perm.uid or shm perm.cuid field in the data structure identified by the

SharedMemoryID parameter. The effective user ID of the calling process is not the root

user ID.

EPERM The Command parameter is SHM_PAGESIZE, and the calling process does not have the

appropriate privilege to allocate pages of the specified page size.

The Command parameter is SHM_LOCK or SHM_UNLOCK, and the calling process **EPERM**

does not have the appropriate privilege to perform the requested operation.

EBUSY The Command parameter is SHM_LOCK or SHM_UNLOCK, and the specified shared

memory segment is currently being used for I/O or is attached by one or more processes.

EBUSY The Command parameter is SHM_PAGESIZE, and the specified shared memory segment

has already been attached by one or more processes or has been pinned via SHM_PIN

or SHM_LOCK.

Examples

The following example allocates a 32MB shared memory region, changes the page size for the shared memory region to 64K, and then pins all of the pages in the shared memory region:

```
size t shm size;
struct shmid ds shm buf = { 0 };
psize_t psize_64k;
psize 64k = 64 * 1024;
/* Create a 32MB shared memory region */
shm_size = 32*1024*1024;
/* Allocate the shared memory region */
if ((id = shmget(IPC PRIVATE, shm size, IPC CREAT)) < 0)</pre>
perror("shmget() failed");
return -1;
/* Use 64K pages for the shared memory region */
shm buf.shm pagesize = psize 64k;
if (shmctl(id, SHM_PAGESIZE, &shm_buf))
perror("shmctl(SHM PAGESIZE) failed");
/* Pin all of the pages in the shared memory region */
if (shmctl(id, SHM_LOCK, NULL))
perror("shmctl(SHM LOCK) failed");
```

The following example allocates a 16MB shared memory region and determines the minimum alignment of the address at which an application can shmat() the shared memory region:

```
int
       id;
size t shm size;
struct shmid ds shm buf = { 0 };
```

```
/* Create a 16MB shared memory region */
shm size = 16*1024*1024;
/* Allocate the shared memory region */
if ((id = shmget(IPC PRIVATE, shm size, IPC CREAT)) < 0)
perror("shmget() failed");
return -1;
/* Determine the address alignment requirements */
if (shmctl(id, SHM_GETLBA, &shm_buf))
perror("shmctl(SHM GETLBA) failed");
else
printf("shmlba = %0811x\n", shm buf.shm lba);
```

shmdt Subroutine

Purpose

Detaches a shared memory segment.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/shm.h>
int shmdt (SharedMemoryAddress)
const void * SharedMemoryAddress;
```

Description

The **shmdt** subroutine detaches from the data segment of the calling process the shared memory segment located at the address specified by the SharedMemoryAddress parameter.

Mapped file segments are automatically detached when the mapped file is closed. However, you can use the shmdt subroutine to explicitly release the segment register used to map a file. Shared memory segments must be explicitly detached with the **shmdt** subroutine.

If the file was mapped for writing, the **shmdt** subroutine updates the **mtime** and **ctime** time stamps.

The following limits apply to shared memory:

- Maximum shared-memory segment size is:
 - 256M bytes before AIX 4.3.1

- 2G bytes for AIX 4.3.1 through AIX 5.1
- 64G bytes for 64-bit applications for AIX 5.1 and later
- · Minimum shared-memory segment size is 1 byte.
- Maximum number of shared memory IDs is 4096 for operating system releases before AIX 4.3.2 and 131072 for AIX 4.3.2 and following.

Parameters

SharedMemoryAddress

Specifies the data segment start address of a shared memory segment.

Return Values

When successful, the **shmdt** subroutine returns a value of 0. Otherwise, the shared memory segment at the address specified by the *SharedMemoryAddress* parameter is not detached, a value of -1 is returned, and the **errno** global variable is set to indicate the error.

Error Codes

The **shmdt** subroutine is unsuccessful if the following condition is true:

EINVAL

The value of the *SharedMemoryAddress* parameter is not the data-segment start address of a shared memory segment.

Related Information

The **exec** subroutine, **exit** subroutine, **fork** subroutine, **fsync** subroutine, **mmap** subroutine, **munmap** subroutine, **shmat** subroutine, **shmctl** subroutine, **shmget** subroutine.

List of Memory Manipulation Services, Subroutines Overview, Understanding Memory Mapping in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

shmget Subroutine

Purpose

Gets shared memory segments.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/shm.h>
```

```
int shmget (Key, Size, SharedMemoryFlag)
key_t Key;
size_t Size
int SharedMemoryFlag;
```

Description

The **shmget** subroutine returns the shared memory identifier associated with the specified *Key* parameter.

The following limits apply to shared memory:

- Maximum shared-memory segment size is:
 - 256 MB before AIX 4.3.1
 - 2 GB for AIX 4.3.1 through AIX 5.1
 - 32 TB for 64-bit applications for AIX 5.1 and later
- Minimum shared-memory segment size is 1 byte.
- Maximum number of shared memory IDs is 4096 for operating system releases before AIX 4.3.2, 131072 for releases AIX 4.3.2 through AIX 5.2, and 1048576 for release AIX 5.3 and later.

Parameters

Specifies either the IPC_PRIVATE value or an IPC key constructed by the ftok subroutine (or Key

by a similar algorithm).

Specifies the number of bytes of shared memory required. Size

SharedMemoryFlag Constructed by logically ORing one or more of the following values:

IPC CREAT

Creates the data structure if it does not already exist.

IPC_EXCL

Causes the shmget subroutine to be unsuccessful if the IPC_CREAT flag is also set, and the data structure already exists.

SHM_LGPAGE

Attempts to create the region so it can be mapped through hardware-supported, large-page mechanisms, if enabled. This is purely advisory. For the system to consider this flag, it must be used in conjunction with the SHM_PIN flag and enabled with the vmtune command (-L to reserve memory for the region (which requires a reboot) and -S to enable SHM_PIN). To successfully get large-pages, the user requesting large-page shared memory must have CAP_BYPASS_RAC_VMM capability. This has no effect on shared memory regions created with the EXTSHM=ON environment variable.

SHM PIN

Attempts to pin the shared memory region if enabled. This is purely advisory. For the system to consider this flag, the system must be enable with vmtune command. This has no effect on shared memory regions created with EXTSHM=ON environment variable.

S_IRUSR

Permits the process that owns the data structure to read it.

S_IWUSR

Permits the process that owns the data structure to modify it.

S IRGRP

Permits the group associated with the data structure to read it.

S IWGRP

Permits the group associated with the data structure to modify it.

S_IROTH

Permits others to read the data structure.

S_IWOTH

Permits others to modify the data structure.

Values that begin with the S_I prefix are defined in the sys/mode.h file and are a subset of the access permissions that apply to files.

A shared memory identifier, its associated data structure, and a shared memory segment equal in number of bytes to the value of the Size parameter are created for the Key parameter if one of the following is true:

- The Key parameter is equal to the IPC_PRIVATE value.
- The Key parameter does not already have a shared memory identifier associated with it, and the **IPC_CREAT** flag is set in the *SharedMemoryFlag* parameter.

Upon creation, the data structure associated with the new shared memory identifier is initialized as follows:

- The shm perm.cuid and shm perm.uid fields are set to the effective user ID of the calling process.
- The shm perm.cgid and shm perm.gid fields are set to the effective group ID of the calling process.
- The low-order 9 bits of the shm perm.mode field are set to the low-order 9 bits of the SharedMemoryFlag parameter.
- The shm segsz field is set to the value of the Size parameter.
- The shm lpid, shm nattch, shm atime, and shm dtime fields are set to 0.
- The shm ctime field is set to the current time.

Note: Once created, a shared memory segment is deleted only when the system reboots or by issuing the **ipcrm** command or using the following **shmctl** subroutine:

```
if (shmct] (id. IPC RMID. 0) == -1)
perror ("error in closing segment"), exit (1);
```

Return Values

Upon successful completion, a shared memory identifier is returned. Otherwise, the shmget subroutine returns a value of -1 and sets the errno global variable to indicate the error.

Error Codes

The **shmget** subroutine is unsuccessful if one or more of the following are true:

EACCES	A shared memory identifier exists for the Key parameter, but operation permission as specified by the	
	low-order 9 bits of the SharedMemoryFlag parameter is not granted.	

EEXIST A shared memory identifier exists for the Key parameter, and both the IPC_CREAT and IPC_EXCL flags are set in the *SharedMemoryFlag* parameter.

EINVAL A shared memory identifier does not exist and the Size parameter is less than the system-imposed minimum or greater than the system-imposed maximum.

A shared memory identifier exists for the Key parameter, but the size of the segment associated with it is **EINVAL** less than the Size parameter, and the Size parameter is not equal to 0.

ENOENT A shared memory identifier does not exist for the Key parameter, and the IPC_CREAT flag is not set in the SharedMemoryFlag parameter.

ENOMEM A shared memory identifier and associated shared memory segment are to be created but the amount of available physical memory is not sufficient to meet the request.

ENOSPC A shared memory identifier will be created, but the system-imposed maximum of shared memory identifiers allowed will be exceeded.

sigaction, sigvec, or signal Subroutine

Purpose

Specifies the action to take upon delivery of a signal.

Libraries

```
sigaction
                            Standard C Library (libc.a)
signal, sigvec
                            Standard C Library (libc.a);
```

Berkeley Compatibility Library (libbsd.a)

Syntax

```
#include <signal.h>
int sigaction ( signal, action, oaction)
int signal;
struct sigaction *action, *oaction;
int sigvec (signal, invec, outvec)
int signal;
struct sigvec *invec, *outvec;
void (*signal (signal, action)) ()
int signal;
void (*action) (int);
```

Description

The **sigaction** subroutine allows a calling process to examine and change the action to be taken when a specific signal is delivered to the process issuing this subroutine.

In multi-threaded applications using the threads library (libpthreads.a), signal actions are common to all threads within the process. Any thread calling the sigaction subroutine changes the action to be taken when a specific signal is delivered to the threads process, that is, to any thread within the process.

Note: The sigaction subroutine must not be used concurrently to the sigwait subroutine on the same signal.

The signal parameter specifies the signal. If the action parameter is not null, it points to a sigaction structure that describes the action to be taken on receipt of the signal parameter signal. If the oaction parameter is not null, it points to a sigaction structure in which the signal action data in effect at the time of the **sigaction** subroutine call is returned. If the *action* parameter is null, signal handling is unchanged; thus, the call can be used to inquire about the current handling of a given signal.

The **sigaction** structure has the following fields:

Member Type	Member Name	Description
void(*) (int)	sa_handler	SIG_DFL, SIG_IGN or pointer to a function.
sigset_t	sa_mask	Additional set of signals to be blocked during execution of signal-catching function.

Member Type	Member Name	Description
int	sa_flags	Special flags to affect behaviour of signal.
void(*) (int, siginfo_t *, void *)	sa_sigaction	Signal-catching function.

The sa handler field can have a SIG DFL or SIG IGN value, or it can be a pointer to a function. A SIG_DFL value requests default action to be taken when a signal is delivered. A value of SIG_IGN requests that the signal have no effect on the receiving process. A pointer to a function requests that the signal be caught; that is, the signal should cause the function to be called. These actions are more fully described in "Parameters".

When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or continue, the entire process is terminated, stopped, or continued, respectively.

If the SA_SIGINFO flag (see below) is cleared in the sa flags field of the sigaction structure, the sa handler field identifies the action to be associated with the specified signal. If the SA SIGINFO flag is set in the sa flags field, the sa sigaction field specifies a signal-catching function. If the SA SIGINFO bit is cleared and the sa handler field specifies a signal-catching function, or if the SA_SIGINFO bit is set, the sa mask field identifies a set of signals that will be added to the signal mask of the thread before the signal-catching function is invoked.

The sa mask field can be used to specify that individual signals, in addition to those in the process signal mask. be blocked from being delivered while the signal handler function specified in the sa handler field is operating. The sa flags field can have the SA ONSTACK, SA OLDSTYLE, or SA NOCLDSTOP bits set to specify further control over the actions taken on delivery of a signal.

If the SA ONSTACK bit is set, the system runs the signal-catching function on the signal stack specified by the sigstack subroutine. If this bit is not set, the function runs on the stack of the process to which the signal is delivered.

If the SA_OLDSTYLE bit is set, the signal action is set to SIG_DFL label prior to calling the signal-catching function. This is supported for compatibility with old applications, and is not recommended since the same signal can recur before the signal-catching subroutine is able to reset the signal action and the default action (normally termination) is taken in that case.

If a signal for which a signal-catching function exists is sent to a process while that process is executing certain subroutines, the call can be restarted if the SA_RESTART bit is set for each signal. The only affected subroutines are the following:

- read, readv, or readvx ("read, readv, readv, readvx, pread, or preadv Subroutine" on page 32)
- write, writex, writev, or writevx ("write, writex, writev, writevx, pwrite, or pwritev Subroutine" on page 583)
- ioctl or ioctlx
- fcntl. lockf. or flock
- wait, wait3, or waitpid ("wait, waitpid, wait3, or wait364 Subroutine" on page 513)

Other subroutines do not restart and return EINTR label, independent of the setting of the SA_RESTART bit.

If SA SIGINFO is cleared and the signal is caught, the signal-catching function will be entered as: void func(int signo);

Where signo is the only argument to the signal catching function. In this case the sa handler member must be used to describe the signal catching function and the application must not modify the

sa sigaction member. If SA SIGINFO is set and the signal is caught, the signal-catching function will be entered as: void func(int signo, siginfo t * info, void * context); where two additional arguments are passed to the signal catching function.

The second argument will point to an object of type siginfo_t explaining the reason why the signal was generated. The third argument can be cast to a pointer to an object of type ucontext t to refer to the receiving process' context that was interrupted when the signal was delivered. In this case the sa sigaction member must be used to describe the signal catching function and the application must not modify the **sa_handler** member.

The **si_signo** member contains the system-generated signal number. The **si_errno** member may contain implementation-dependent additional error information. If nonzero, it contains an error number identifying the condition that caused the signal to be generated. The si_code member contains a code identifying the cause of the signal. If the value of si_code is less than or equal to 0, the signal was generated by a process and si_pid and si_uid respectively indicate the process ID and the real user ID of the sender.

The **signal.h** header description contains information about the signal specific contents of the elements of the siginfo t type. If SA NOCLDWAIT is set and sig equals SIGCHLD, child processes of the calling processes will not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited for children that were transformed into zombie processes, it will block until all of its children terminate, and wait, wait3, waitid and waitpid will fail and set errno to ECHILD. Otherwise, terminating child processes will be transformed into zombie processes, unless SIGCHLD is set to SIG IGN. When SIGCHLD is set to SIG IGN, the signal is ignored and any zombie children of the process will be cleaned up.

If SA_RESETHAND is set, the disposition of the signal will be reset to SIG_DFL and the SA_SIGINFO flag will be cleared on entry to the signal handler.

If **SA NODEFER** is set and *sig* is caught, *sig* will not be added to the process' signal mask on entry to the signal handler unless it is included in sa mask. Otherwise, sig will always be added to the process' signal mask on entry to the signal handler. If sig is SIGCHLD, the SA_NOCLDSTOP flag is not set in sa_flags, and the implementation supports the SIGCHLD signal, a SIGCHLD signal will be generated for the calling process whenever any of its child processes stop.

If sig is SIGCHLD and the SA_NOCLDSTOP flag is set in sa_flags, the implementation will not generate a SIGCHLD signal in this way. When a signal is caught by a signal-catching function installed by sigaction, a new signal mask is calculated and installed for the duration of the signal-catching function (or until a call to either sigprocmask orsigsuspend is made).

This mask is formed by taking the union of the current signal mask and the value of the sa mask for the signal being delivered unless SA_NODEFER or SA_RESETHAND is set, and including the signal being delivered. If the user's signal handler returns normally, the original signal mask is restored.

Once an action is installed for a specific signal, it remains installed until another action is explicitly requested (by another call to sigaction), until the SA RESETHAND flag causes resetting of the handler, or until one of the **exec** functions is called.

If the previous action for sig had been established by signal, the values of the fields returned in the structure pointed to by oact are unspecified, and in particular oact->sa handler is not necessarily the same value passed to signal.

However, if a pointer to the same structure or a copy thereof is passed to a subsequent call to sigaction through the act argument, handling of the signal will be as if the original call to signal were repeated.

If sigaction fails, no new signal handler is installed. It is unspecified whether an attempt to set the action for a signal that cannot be caught or ignored to SIG DFL is ignored or causes an error to be returned with errno set to EINVAL.

If SA_SIGINFO is not set in sa_flags, then the disposition of subsequent occurrences of sig when it is already pending is implementation-dependent; the signal-catching function will be invoked with a single argument.

The **sigvec** and **signal** subroutines are provided for compatibility to older operating systems. Their function is a subset of that available with **sigaction**.

The sigvec subroutine uses the sigvec structure instead of the sigaction structure. The sigvec structure specifies a mask as an int instead of a sigset t. The mask for the sigvec subroutine is constructed by setting the i-th bit in the mask if signal i is to be blocked. Therefore, the **sigvec** subroutine only allows signals between the values of 1 and 31 to be blocked when a signal-handling function is called. The other signals are not blocked by the signal-handler mask.

The **sigvec** structure has the following members:

```
int (*sv handler)();
/* signal handler */
int sv mask;
/* signal mask
int sv flags;
/* flags
```

The sigvec subroutine in the libbsd.a library interprets the SV_INTERRUPT flag and inverts it to the SA RESTART flag of the sigaction subroutine. The sigvec subroutine in the libc.a library always sets the **SV_INTERRUPT** flag regardless of what was passed in the **sigvec** structure.

The **signal** subroutine in the **libc.a** library allows an action to be associated with a signal. The action parameter can have the same values that are described for the sv handler field in the sigaction structure of the signation subroutine. However, no signal handler mask or flags can be specified; the signal subroutine implicitly sets the signal handler mask to additional signals and the flags to be SA OLDSTYLE.

Upon successful completion of a signal call, the value of the previous signal action is returned. If the call fails, a value of -1 is returned and the errno global variable is set to indicate the error as in the sigaction call.

The signal in libc.a does not set the SA_RESTART flag. It sets the signal mask to the signal whose action is being specified, and sets flags to SA OLDSTYLE. The Berkeley Software Distribution (BSD) version of signal sets the SA_RESTART flag and preserves the current settings of the signal mask and flags. The BSD version can be used by compiling with the Berkeley Compatibility Library (libbsd.a).

Parameters

signal Defines the signal. The following list describes signal names and the specification for each. The value of the signal parameter can be any signal name from this list or its corresponding number except the SIGKILL name. If you use the signal name, you must include the signal.h file, because the name is correlated in the file with its corresponding number.

Note: The symbols in the following list of signals represent these actions:

- Specifies the default action that includes creating a core dump file.
- @ Specifies the default action that stops the process receiving these signals.
- ! Specifies the default action that restarts or continues the process receiving these signals.
- Specifies the default action that ignores these signals.

- % Indicates a likely shortage of paging space.
- # See Terminal Programming for more information on the use of these signals.

File size limit exceeded (see the **setrlimit** subroutine).(25)

action Points to a sigaction structure that describes the action to be taken upon receipt of the signal parameter signal.

The three types of actions that can be associated with a signal (SIG_DFL, SIG_IGN, or a pointer to a function) are described as follows:

SIG_DFL Default action: signal-specific default action.

Except for those signal numbers marked with a + (plus sign), @ (at sign), or ! (exclamation point), the default action for a signal ends the receiving process with all of the consequences described in the _exit subroutine. In addition, a memory image file is created in the current directory of the receiving process if an asterisk appears with a signal parameter and the following conditions are met:

- The saved user ID and the real user ID of the receiving process are equal.
- An ordinary file named core exists in the current directory and is writable, or it can be created. If the file is created, it must have the following properties:

The access permission code 0666 (0x1B6), modified by the file-creation mask (see the umask subroutine)

A file owner ID that is the same as the effective user ID of the receiving process

A file group ID that is the same as the effective group ID of the receiving process.

For signal numbers marked with a ! (exclamation point), the default action restarts the receiving process if it has stopped, or continues to run the receiving process.

For signal numbers marked with a @ (at sign), the default action stops the execution of the receiving process temporarily. When a process stops, a SIGCHLD signal is sent to its parent process, unless the parent process has set the SA NOCLDSTOP bit. While a process has stopped, any additional signals that are sent are not delivered until the process has started again. An exception to this is the SIGKILL signal, which always terminates the receiving process. Another exception is the SIGCONT signal, which always causes the receiving process to restart or continue running. A process whose parent process has ended is sent a SIGKILL signal if the SIGTSTP, SIGTTIN, or SIGTTOU signals are generated for that process.

For signal numbers marked with a +, the default action ignores the signal. In this case, the delivery of a signal does not affect the receiving process.

If a signal action is set to SIG_DFL while the signal is pending, the signal remains pending.

SIG_IGN Ignore signal.

Delivery of the signal does not affect the receiving process. If a signal action is set to the **SIG_IGN** action while the signal is pending, the pending signal is discarded.

An exception to this is the SIGCHLD signal whose SIG_DFL action ignores the signal. If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes will not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited for children that were transformed into zombie processes, it will block until all of its children terminate, and wait, wait3, waitid and waitpid will fail and set errno to ECHILD.

Note: The SIGKILL and SIGSTOP signals cannot be ignored.

Pointer to a function, catch signal.

Upon delivery of the signal, the receiving process runs the signal-catching function specified by the pointer to function. The signal-handler subroutine can be declared as follows:

```
handler (signal, Code, SCP)
int signal, Code;
struct sigcontext *SCP;
```

The signal parameter is the signal number. The Code parameter is provided only for compatibility with other UNIX-compatible systems. The Code parameter value is always 0. The

SCP parameter points to the **sigcontext** structure that is later used to restore the previous execution context of the process. The sigcontext structure is defined in the signal.h file.

A new signal mask is calculated and installed for the duration of the signal-catching function (or until **sigprocmask** or**sigsuspend** subroutine is made). This mask is formed by joining the process-signal mask (the mask associated with the action for the signal being delivered) and the mask corresponding to the signal being delivered. The mask associated with the signal-catching function is not allowed to block those signals that cannot be ignored. This is enforced by the kernel without causing an error to be indicated. If and when the signal-catching function returns, the original signal mask is restored (modified by any sigprocmask calls that were made since the signal-catching function was called) and the receiving process resumes execution at the point it was interrupted.

The signal-catching function can cause the process to resume in a different context by calling the longjmp subroutine. When the longjmp subroutine is called, the process leaves the signal stack, if it is currently on the stack, and restores the process signal mask to the state when the corresponding setimp subroutine was made.

Once an action is installed for a specific signal, it remains installed until another action is explicitly requested (by another call to the sigaction subroutine), or until one of the exec subroutines is called. An exception to this is when the SA OLDSTYLE bit is set. In this case the action of a caught signal gets set to the SIG DFL action before the signal-catching function for that signal is called.

If a signal action is set to a pointer to a function while the signal is pending, the signal remains pendina.

When signal-catching functions are invoked asynchronously with process execution, the behavior of some of the functions defined by this standard is unspecified if they are called from a signal-catching function. The following set of functions are reentrant with respect to signals; that is, applications can invoke them, without restriction, from signal-catching functions:

oaction

Points to a sigaction structure in which the signal action data in effect at the time of the sigaction subroutine is returned.

invec Points to a sigvec structure that describes the action to be taken upon receipt of the signal parameter signal.

outvec Points to a sigvec structure in which the signal action data in effect at the time of the sigvec subroutine is returned.

action Specifies the action associated with a signal.

Return Values

Upon successful completion, the sigaction subroutine returns a value of 0. Otherwise, a value of SIG_ERR is returned and the errno global variable is set to indicate the error.

Error Codes

The sigaction subroutine is unsuccessful and no new signal handler is installed if one of the following occurs:

EFAULT The action or oaction parameter points to a location outside of the allocated address space of the

process.

EINVAL The signal parameter is not a valid signal number.

EINVAL An attempt was made to ignore or supply a handler for the SIGKILL, SIGSTOP, and SIGCONT signals.

Signal Management in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs provides more information about signal management in multi-threaded processes.

sigaltstack Subroutine

Purpose

Allows a thread to define and examine the state of an alternate stack for signal handlers.

Library

(libc.a)

Syntax

#include <signal.h>

int sigaltstack(const stack_t *ss, stack_t *oss);

Description

The **sigaltstack** subroutine allows a thread to define and examine the state of an alternate stack for signal handlers. Signals that have been explicitly declared to execute on the alternate stack will be delivered on the alternate stack.

If ss is not null pointer, it points to a **stack_t** structure that specifies the alternate signal stack that will take effect upon return from sigaltstack subroutine. The ss flags member specifies the new stack state. If it is set to SS_DISABLE, the stack is disabled and ss_sp and ss_ssize are ignored. Otherwise the stack will be enabled, and the ss_sp and ss_size members specify the new address and size of the stack.

The range of addresses starting at ss_sp, up to but not including ss_sp + ss_size, is available to the implementation for use as the stack.

If oss is not a null pointer, on successful completion it will point to a stack t structure that specifies the alternate signal stack that was in effect prior to the sigaltstack subroutine. The ss sp and ss size members specify the address and size of the stack. The ss_flags member specifies the stack's state, and may contain one of the following values:

The process is currently executing on the alternate signal stack. Attempts to modify the alternate SS ONSTACK

signal stack while the process is executing or it fails. This flag must not be modified by

SS_DISABLE The alternate signal stack is currently disabled.

The value of SIGSTKSZ is a system default specifying the number of bytes that would be used to cover the usual case when manually allocating an alternate stack area. The value MINSIGSTKSZ is defined to be the minimum stack size for a signal handler. In computing an alternate stack size, a program should add that amount to its stack requirements to allow for the system implementation overhead.

After a successful call to one of the exec functions, there are no alternate stacks in the new process image.

Parameters

A pointer to a **stack t** structure specifying the alternate stack to use during signal handling.

A pointer to a **stack** t structure that will indicate the alternate stack currently in use. oss

Return Values

Upon successful completion, sigaltstack subroutine returns 0. Otherwise, it returns -1 and set errno to indicate the error.

-1 Not successful and the **errno** global variable is set to one of the following error codes.

Error Codes

EINVAL The ss parameter is not a null pointer, and the ss flags member pointed to by ss contains flags other

that SS DISABLE.

The size of the alternate stack area is less than MINSIGSTKSZ. ENOMEM

EPERM An attempt was made to modify an active stack.

Related Information

The **sigaction** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, **sigsetimp** ("sigsetimp or siglongimp Subroutine" on page 235) subroutine.

sigemptyset, sigfillset, sigaddset, sigdelset, or sigismember **Subroutine**

Purpose

Creates and manipulates signal masks.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
int sigemptyset ( Set)
sigset t *Set;
int sigfillset (Set)
sigset_t *Set;
int sigaddset (Set, SignalNumber)
sigset t *Set;
int Signal Number;
int sigdelset (Set, SignalNumber)
sigset_t *Set;
int Signal Number;
int sigismember (Set, SignalNumber)
sigset_t *Set;
int SignalNumber;
```

Description

The sigemptyset, sigfillset, sigaddset, sigdelset, and sigismember subroutines manipulate sets of signals. These functions operate on data objects addressable by the application, not on any set of signals known to the system, such as the set blocked from delivery to a process or the set pending for a process.

The **sigemptyset** subroutine initializes the signal set pointed to by the *Set* parameter such that all signals are excluded. The **sigfillset** subroutine initializes the signal set pointed to by the *Set* parameter such that all signals are included. A call to either the sigfillset or sigemptyset subroutine must be made at least once for each object of the **sigset_t** type prior to any other use of that object.

The sigaddset and sigdelset subroutines respectively add and delete the individual signal specified by the SignalNumber parameter from the signal set specified by the Set parameter. The sigismember subroutine tests whether the SignalNumber parameter is a member of the signal set pointed to by the Set parameter.

Parameters

Set Specifies the signal set. SignalNumber Specifies the individual signal.

Examples

#include <signal.h>

To generate and use a signal mask that blocks only the SIGINT signal from delivery, enter the following:

```
int return value;
sigset_t newset;
sigset_t *newset_p;
newset p = &newset;
sigemptyset(newset_p);
sigaddset(newset_p, SIGINT);
return_value = sigprocmask (SIG_SETMASK, newset_p, NULL);
```

Return Values

Upon successful completion, the sigismember subroutine returns a value of 1 if the specified signal is a member of the specified set, or the value of 0 if not. Upon successful completion, the other subroutines return a value of 0. For all the preceding subroutines, if an error is detected, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The sigfillset, sigdelset, sigismember, and sigaddset subroutines are unsuccessful if the following is true:

EINVAL The value of the SignalNumber parameter is not a valid signal number.

Related Information

The "sigaction, sigvec, or signal Subroutine" on page 213, "sigprocmask, sigsetmask, or sigblock Subroutine" on page 228, and "sigsuspend or sigpause Subroutine" on page 237.

siginterrupt Subroutine

Purpose

Sets restart behavior with respect to signals and subroutines.

Library

Standard C Library (libc.a)

Syntax

```
int siginterrupt ( Signal, Flag)
int Signal, Flag;
```

Description

The siginterrupt subroutine is used to change the subroutine restart behavior when a subroutine is interrupted by the specified signal. If the flag is false (0), subroutines are restarted if they are interrupted by the specified signal and no data has been transferred yet.

If the flag is true (1), the restarting of subroutines is disabled. If a subroutine is interrupted by the specified signal and no data has been transferred, the subroutine will return a value of -1 with the errno global variable set to EINTR. Interrupted subroutines that have started transferring data return the amount of data actually transferred. Subroutine interrupt is the signal behavior found on 4.1 BSD and AT&T System V UNIX systems.

Note that the BSD signal-handling semantics are not altered in any other way. Most notably, signal handlers always remain installed until explicitly changed by a subsequent sigaction or sigvec call, and the signal mask operates as documented in the **sigaction** subroutine. Programs can switch between restartable and interruptible subroutine operations as often as desired in the running of a program.

Issuing a siginterrupt call during the running of a signal handler causes the new action to take place on the next signal caught.

Restart does not occur unless it is explicitly specified with the sigaction or sigvec subroutine in the libc.a library.

This subroutine uses an extension of the sigvec subroutine that is not available in the BSD 4.2; hence, it should not be used if backward compatibility is needed.

Parameters

Signal Indicates the signal. Flag Indicates true or false.

Return Values

A value of 0 indicates that the call succeeded. A value of -1 indicates that the supplied signal number is not valid.

Related Information

The sigaction or sigvec ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, sigpause ("sigsuspend or sigpause Subroutine" on page 237) subroutine, sigsetmask or sigblock ("sigprocmask, sigsetmask, or sigblock Subroutine" on page 228) subroutine.

signbit Macro

Purpose

Tests the sign.

Syntax

#include <math.h> int signbit (x)real-floating x;

Description

The signbit macro determines whether the sign of its argument value is negative. NaNs, zeros, and infinities have a sign bit.

Parameters

Specifies the value to be tested.

Return Values

The **signbit** macro returns a nonzero value if the sign of its argument value is negative.

math.h in AIX 5L Version 5.3 Files Reference.

sigpending Subroutine

Purpose

Returns a set of signals that are blocked from delivery.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
int sigpending ( Set)
sigset_t *Set;
```

Description

The **sigpending** subroutine stores a set of signals that are blocked from delivery and pending for the calling thread, in the space pointed to by the *Set* parameter.

Parameters

Set Specifies the set of signals.

Return Values

Upon successful completion, the **sigpending** subroutine returns a value of 0. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The sigpending subroutine is unsuccessful if the following is true:

EINVAL The input parameter is outside the user's address space.

Related Information

The **sigprocmask** ("sigprocmask, sigsetmask, or sigblock Subroutine") subroutine.

sigprocmask, sigsetmask, or sigblock Subroutine

Purpose

Sets the current signal mask.

Library

Standard C Library (libc.a)

Syntax

#include <signal.h>

```
int sigprocmask ( How, Set, OSet)
int How:
const sigset_t *Set;
sigset *OSet;
int sigsetmask ( SignalMask)
int SignalMask;
int sigblock (SignalMask)
int SignalMask;
```

Description

Note: The sigprocmask, sigsetmask, and sigblock subroutines must not be used in a multi-threaded application. The sigthreadmask ("sigthreadmask Subroutine" on page 238) subroutine must be used instead.

The **sigprocmask** subroutine is used to examine or change the signal mask of the calling thread.

The subroutine is used to examine or change the signal mask of the calling process.

Typically, you should use the sigprocmask(SIG_BLOCK) subroutine to block signals during a critical section of code. Then use the sigprocmask(SIG SETMASK) subroutine to restore the mask to the previous value returned by the sigprocmask(SIG BLOCK) subroutine.

If there are any pending unblocked signals after the call to the **sigprocmask** subroutine, at least one of those signals will be delivered before the **sigprocmask** subroutine returns.

The **sigprocmask** subroutine does not allow the **SIGKILL** or **SIGSTOP** signal to be blocked. If a program attempts to block either signal, the sigprocmask subroutine gives no indication of the error.

Parameters

Indicates the manner in which the set is changed. It can have one of the following values: How

SIG BLOCK

The resulting set is the union of the current set and the signal set pointed to by the Set parameter.

SIG UNBLOCK

The resulting set is the intersection of the current set and the complement of the signal set pointed to by the Set parameter.

SIG SETMASK

The resulting set is the signal set pointed to by the *Set* parameter.

Set Specifies the signal set. If the value of the Set parameter is not null, it points to a set of signals to

be used to change the currently blocked set. If the value of the Set parameter is null, the value of the How parameter is not significant and the process signal mask is unchanged. Thus, the call

can be used to inquire about currently blocked signals.

OSet If the OSet parameter is not the null value, the signal mask in effect at the time of the call is

stored in the space pointed to by the OSet parameter.

SignalMask Specifies the signal mask of the process.

Compatibility Interfaces

The **sigsetmask** subroutine allows changing the process signal mask for signal values 1 to 31. This same function can be accomplished for all values with the sigprocmask(SIG SETMASK) subroutine. The signal of value *i* will be blocked if the *i*th bit of *SignalMask* parameter is set.

Upon successful completion, the sigsetmask subroutine returns the value of the previous signal mask. If the subroutine fails, a value of -1 is returned and the errno global variable is set to indicate the error as in the sigprocmask subroutine.

The **sigblock** subroutine allows signals with values 1 to 31 to be logically ORed into the current process signal mask. This same function can be accomplished for all values with the sigprocmask(SIG BLOCK) subroutine. The signal of value i will be blocked, in addition to those currently blocked, if the i-th bit of the SignalMask parameter is set.

It is not possible to block a SIGKILL or SIGSTOP signal using the sigblock or sigsetmask subroutine. This restriction is *silently* imposed by the system without causing an error to be indicated.

Upon successful completion, the sigblock subroutine returns the value of the previous signal mask. If the subroutine fails, a value of -1 is returned and the errno global variable is set to indicate the error as in the sigprocmask subroutine.

Return Values

Upon completion, a value of 0 is returned. If the sigprocmask subroutine fails, the signal mask of the process is unchanged, a value of -1 is returned, and the global variable errno is set to indicate the error.

Error Codes

The **sigprocmask** subroutine is unsuccessful if the following is true:

EPERM The user does not have the privilege to change the signal's mask.

EINVAL The value of the *How* parameter is not equal to one of the defined values.

EFAULT The user's mask is not in the process address space.

Examples

To set the signal mask to block only the **SIGINT** signal from delivery, enter:

```
#include <signal.h>
int return value;
sigset t newset;
sigset t *newset p;
newset p = &newset;
sigemptyset(newset p);
sigaddset(newset p, SIGINT);
return_value = sigprocmask (SIG_SETMASK, newset_p, NULL);
```

Related Information

The **kill** or **killpg** subroutine, **sigaction**, **sigvec**, or **signal** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, sigaddset, sigdelset, sigemptyset, sigfillset, sigismember ("sigemptyset, sigfillset, sigaddset, sigdelset, or sigismember Subroutine" on page 224) subroutine, sigpause ("sigsuspend or signause Subroutine" on page 237) subroutine, sigpending ("sigpending Subroutine" on page 228) subroutine, sigsuspend ("sigsuspend or sigpause Subroutine" on page 237) subroutine.

sigqueue Subroutine

Purpose

Queues a signal to a process.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
int sigqueue (pid, signo, value)
pid_t pid;
int signo;
const union sigval value;
```

Description

The **siggueue** subroutine causes the signal specified by the *signo* parameter to be sent with the value specified by the value parameter to the process specified by the pid parameter. If the signo parameter is zero, error checking is performed but no signal is actually sent. This can be used to check the validity of the *pid* parameter.

The conditions required for a process to have permission to queue a signal to another process are the same as for the kill subroutine.

The **siggueue** subroutine returns immediately. If **SA SIGINFO** is set by the receiving process for the specified signal, and if the resources are available to queue the signal, the signal is queued and sent to the receiving process. If **SA_SIGINFO** is not set for the signo parameter, the signal is sent at least once to the receiving process.

If multiple signals in the range SIGRTMIN to SIGRTMAX should be available for delivery, the lowest numbered of them will be delivered first.

Parameters

Specifies the process to which a signal is to be sent. pid

signo Specifies the signal number.

value Specifies the value to be sent with the signal.

Return Values

Upon successful completion the sigqueue subroutine returns a zero. If unsuccessful, it returns a -1 and sets the **errno** variable to indicate the error.

Error Code

The **sigqueue** subroutine will fail if:

EAGAIN No resources are available to queue the signal. The process has already queued SIGQUEUE_MAX

signals that are still pending at the receiver(s), or a system-wide resource limit has been exceeded.

EINVAL The value of the signo parameter is an invalid or unsupported signal number, or if the selected signal

can either stop or continue the receiving process. AIX does not support queuing of the following

signals: SIGKILL, SIGSTOP, SIGTSTP, SIGCONT, SIGTTIN, SIGTTOU, and SIGCLD.

EPERM The process does not have the appropriate privilege to send the signal to the receiving process.

ESRCH The process specified by the *pid* parameter does not exist.

Related Information

"sigtimedwait and sigwaitinfo Subroutine" on page 240 and "sigaction, sigvec, or signal Subroutine" on page 213.

sigset, sighold, sigrelse, or sigignore Subroutine

Purpose

Enhance the signal facility and provide signal management.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
void (*sigset( Signal, Function))()
int Signal:
void (*Function)();
int sighold ( Signal)
int Signal;
int sigrelse ( Signal)
int Signal;
int sigignore ( Signal)
int Signal;
```

Description

The sigset, sighold, sigrelse, and sigignore subroutines enhance the signal facility and provide signal management for application processes.

The **sigset** subroutine specifies the system signal action to be taken upon receiving a *Signal* parameter.

The sighld and sigrelse subroutines establish critical regions of code. A call to the sighold subroutine is analogous to raising the priority level and deferring or holding a signal until the priority is lowered by sigrelse. The sigrelse subroutine restores the system signal action to the action that was previously specified by the sigset structure.

The **sigignore** subroutine sets the action for the *Signal* parameter to **SIG_IGN**.

The other signal management routine, signal, should not be used in conjunction with these routines for a particular signal type.

Parameters

Signal Specifies the signal. The Signal parameter can be assigned any one of the following signals:

SIGHUP

Hang up

SIGINT Interrupt

SIGQUIT

SIGILL Illegal instruction (not reset when caught)*

SIGTRAP

Trace trap (not reset when caught)*

SIGABRT

Abort*

SIGFPE

Floating point exception*, or arithmetic exception, integer divide by 0

SIGSYS

Bad argument to routine*

SIGPIPE

Write on a pipe with no one to read it

SIGALRM

Alarm clock

SIGTERM

Software termination signal

SIGUSR1

User-defined signal 1

SIGUSR2

User-defined signal 2.

For portability, application programs should use or catch only the signals listed above. Other signals are hardware-dependant and implementation-dependant and may have very different meanings or results across systems. For example, the System V signals (SIGEMT, SIGBUS, SIGSEGV, and SIGIOT) are implementation-dependent and are not listed above. Specific implementations may have other implementation-dependent signals.

^{*} The default action for these signals is an abnormal termination.

Function

Specifies the choice. The Function parameter is declared as a type pointer to a function returning void. The Function parameter is assigned one of four values: SIG_DFL, SIG_IGN, SIG_HOLD, or an address of a signal-catching function. Definitions of the actions taken by each of the values are:

SIG DFL

Terminate process upon receipt of a signal.

Upon receipt of the signal specified by the Signal parameter, the receiving process is to be terminated with all of the consequences outlined in the _exit subroutine. In addition, if Signal is one of the signals marked with an asterisk above, implementation-dependent abnormal process termination routines, such as a core dump, can be invoked.

SIG IGN

Ignore signal.

Any pending signal specified by the Signal parameter is discarded. A pending signal is a signal that has occurred but for which no action has been taken. The system signal action is set to ignore future occurrences of this signal type.

SIG HOLD

Hold signal.

The signal specified by the Signal parameter is to be held. Any pending signal of this type remains held. Only one signal of each type is held.

address

Catch signal.

Upon receipt of the signal specified by the Signal parameter, the receiving process is to execute the signal-catching function pointed to by the Function parameter. Any pending signal of this type is released. This address is retained across calls to the other signal management functions, sighold and sigrelse. The signal number Signal is passed as the only argument to the signal-catching function. Before entering the signal-catching function, the value of the Function parameter for the caught signal is set to SIG HOLD. During normal return from the signal-catching handler, the system signal action is restored to the Function parameter and any held signal of this type is released. If a nonlocal goto (see the **setimp** subroutine) is taken, the **sigrelse** subroutine must be invoked to restore the system signal action and to release any held signal of this type.

Upon return from the signal-catching function, the receiving process will resume execution at the point at which it was interrupted, except for implementation-defined signals in which this may not be

When a signal to be caught occurs during a nonatomic operation such as a call to the read, write, open, or ioctl subroutine on a slow device (such as a terminal); during a pause subroutine; during a wait subroutine that does not return immediately, the signal-catching function is executed. The interrupted routine then returns a value of -1 to the calling process with the errno global variable set to **EINTR**.

Return Values

Upon successful completion, the sigset subroutine returns the previous value of the system signal action for the specified Signal. Otherwise, it returns SIG ERR and the errno global variable is set to indicate the error.

For the **sighold**, **sigrelse**, and **sigignore** subroutines, a value of 0 is returned upon success. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The sigset, sighold, sigrelse, or sigignore subroutine is unsuccessful if the following is true:

EINVAL The Signal value is either an illegal signal number, or the default handling of Signal cannot be changed.

Related Information

The exit subroutine, kill subroutine, setjmp ("setjmp or longjmp Subroutine" on page 178) subroutine, signal ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, wait ("wait, waitpid, wait3, or wait364 Subroutine" on page 513)subroutine.

sigsetimp or siglongimp Subroutine

Purpose

Saves or restores stack context and signal mask.

Library

Standard C Library (libc.a)

Syntax

```
#include <setjmp.h>
int sigsetjmp ( Environment, SaveMask)
sigjmp buf Environment;
int SaveMask;
void siglongjmp (Environment, Value)
sigjmp buf Environment;
int Value;
```

Description

The **sigsetimp** subroutine saves the current stack context, and if the value of the *SaveMask* parameter is not 0, the **sigsetimp** subroutine also saves the current signal mask of the process as part of the calling environment.

The **siglongimp** subroutine restores the saved signal mask only if the *Environment* parameter was initialized by a call to the **sigsetimp** subroutine with a nonzero *SaveMask* parameter argument.

Parameters

Environment Specifies an address for a **sigimp_buf** structure.

SaveMask Specifies the flag used to determine if the signal mask is to be saved.

Value Specifies the return value from the **siglongimp** subroutine.

Return Values

The **sigsetimp** subroutine returns a value of 0. The **siglongimp** subroutine returns a nonzero value.

Related Information

The **setimp** or **longimp** ("setimp or longimp Subroutine" on page 178) subroutine, **sigaction** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, sigprocmask ("sigprocmask, sigsetmask, or sigblock Subroutine" on page 228) subroutine, sigsuspend ("sigsuspend or sigpause Subroutine" on page 237) subroutine.

sigstack Subroutine

Purpose

Sets and gets signal stack context.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
int sigstack ( InStack, OutStack)
struct sigstack *InStack, *OutStack;
```

Description

The **sigstack** subroutine defines an alternate stack on which signals are to be processed.

When a signal occurs and its handler is to run on the signal stack, the system checks to see if the process is already running on that stack. If so, it continues to do so even after the handler returns. If not, the signal handler runs on the signal stack, and the original stack is restored when the handler returns.

Use the **sigvec** or **sigaction** subroutine to specify whether a given signal-handler routine is to run on the signal stack.

Attention: A signal stack does not automatically increase in size as a normal stack does. If the stack overflows, unpredictable results can occur.

Parameters

InStack

Specifies the stack pointer of the new signal stack.

If the value of the *InStack* parameter is nonzero, it points to a **sigstack** structure, which has the following members:

```
caddr_t ss_sp;
int ss onstack;
```

The value of InStack->ss_sp specifies the stack pointer of the new signal stack. Since stacks grow from numerically greater addresses to lower ones, the stack pointer passed to the **sigstack** subroutine should point to the numerically high end of the stack area to be used.

InStack->ss_onstack should be set to a value of 1 if the process is currently running on that stack; otherwise, it should be a value of 0.

OutStack

If the value of the *InStack* parameter is 0 (that is, a null pointer), the signal stack state is not set. Points to structure where current signal stack state is stored.

If the value of the *OutStack* parameter is nonzero, it points to a **sigstack** structure into which the **sigstack** subroutine stores the current signal stack state.

If the value of the OutStack parameter is 0, the previous signal stack state is not reported.

Return Values

Upon successful completion, the **sigstack** subroutine returns a value of 0. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The sigstack subroutine is unsuccessful and the signal stack context remains unchanged if the following is true:

EFAULT The InStack or OutStack parameter points outside of the address space of the process.

Related Information

Thelongimp ("setimp or longimp Subroutine" on page 178) subroutine, setimp ("setimp or longimp Subroutine" on page 178) subroutine, sigaction, signal, or sigvec ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine.

sigsuspend or sigpause Subroutine

Purpose

Automatically changes the set of blocked signals and waits for a signal.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
int sigsuspend ( SignalMask)
const sigset_t *SignalMask;
int sigpause (SignalMask)
int SignalMask;
```

Description

The sigsuspend subroutine replaces the signal mask of a thread with the set of signals pointed to by the SignalMask parameter. It then suspends execution of the thread until a signal is delivered that executes a signal-catching function or terminates the process. The sigsuspend subroutine does not allow the SIGKILL or SIGSTOP signal to be blocked. If a program attempts to block one of these signals, the **sigsuspend** subroutine gives no indication of the error.

If delivery of a signal causes the process to end, the sigsuspend subroutine does not return. If delivery of a signal causes a signal-catching function to start, the sigsuspend subroutine returns after the signal-catching function returns, with the signal mask restored to the set that existed prior to the sigsuspend subroutine.

The sigsuspend subroutine sets the signal mask and waits for an unblocked signal as one atomic operation. This means that signals cannot occur between the operations of setting the mask and waiting for a signal. If a program invokes the sigprocmask (SIG_SETMASK) and pause subroutines separately, a signal that occurs between these subroutines might not be noticed by the pause subroutine.

In normal usage, a signal is blocked by using the sigprocmask(SIG BLOCK,...) subroutine for single-threaded applications, or the sigthreadmask(SIG BLOCK,...) subroutine for multi-threaded applications (using the libpthreads.a threads library) at the beginning of a critical section. The process/thread then determines whether there is work for it to do. If no work is to be done, the process/thread waits for work by calling the sigsuspend subroutine with the mask previously returned by the sigprocmask or sigthreadmask subroutine.

The **sigpause** subroutine is provided for compatibility with older UNIX systems; its function is a subset of the sigsuspend subroutine.

Parameter

SignalMask

Points to a set of signals.

Return Values

If a signal is caught by the calling thread and control is returned from the signal handler, the calling thread resumes execution after the sigsuspend or sigpause subroutine, which always return a value of -1 and set the errno global variable to EINTR.

Related Information

The pause subroutine, sigprocmask ("sigprocmask, sigsetmask, or sigblock Subroutine" on page 228) subroutine, sigaction or signal ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, **sigthreadmask** ("sigthreadmask Subroutine") subroutine.

Signal Management in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs provides more information about signal management in multi-threaded processes.

sigthreadmask Subroutine

Purpose

Sets the signal mask of a thread.

Library

Threads Library (libpthreads.a)

Syntax

```
#include <pthread.h>
#include <signal.h>
int sigthreadmask( how, set, old set)
int how:
const sigset_t *set;
sigset t *old set;
```

Description

The sigthreadmask subroutine is used to examine or change the signal mask of the calling thread. The sigprocmask subroutine must not be used in a multi-threaded process.

Typically, the sigthreadmask(SIG BLOCK) subroutine is used to block signals during a critical section of code. The sigthreadmask(SIG SETMASK) subroutine is then used to restore the mask to the previous value returned by the sigthreadmask(SIG BLOCK) subroutine.

If there are any pending unblocked signals after the call to the sigthreadmask subroutine, at least one of those signals will be delivered before the **sigthreadmask** subroutine returns.

The **sigthreadmask** subroutine does not allow the **SIGKILL** or **SIGSTOP** signal to be blocked. If a program attempts to block either signal, the sigthreadmask subroutine gives no indication of the error. Note: The pthread.h header file must be the first included file of each source file using the threads library.

Parameters

how Indicates the manner in which the set is changed. It can have one of the following values:

SIG BLOCK

The resulting set is the union of the current set and the signal set pointed to by the set parameter.

SIG UNBLOCK

The resulting set is the intersection of the current set and the complement of the signal set pointed to by the set parameter.

SIG SETMASK

The resulting set is the signal set pointed to by the set parameter.

Specifies the signal set. If the value of the Set parameter is not null, it points to a set of signals to be set

used to change the currently blocked set. If the value of the Set parameter is null, the value of the How parameter is not significant and the process signal mask is unchanged. Thus, the call can be used to

inquire about currently blocked signals.

If the old_set parameter is not the null value, the signal mask in effect at the time of the call is stored in old_set

the spaced pointed to by the old_set parameter.

Return Values

Upon completion, a value of 0 is returned. If the sigthreadmask subroutine fails, the signal mask of the process is unchanged, a value of -1 is returned, and the global variable errno is set to indicate the error.

Error Codes

The sigthreadmask subroutine is unsuccessful if the following is true:

EFAULT The set or old_set pointers are not in the process address space.

EINVAL The value of the how parameter is not supported.

EPERM The calling thread does not have the privilege to change the signal's mask.

Examples

To set the signal mask to block only the **SIGINT** signal from delivery, enter:

```
#include <pthread.h>
#include <signal.h>
int return value;
sigset_t newset;
sigset_t *newset_p;
newset p = &newset;
sigemptyset(newset p);
sigaddset(newset_p, SIGINT);
return value = sigthreadmask(SIG_SETMASK, newset_p, NULL);
```

Related Information

The kill or killpg subroutine, pthread kill subroutine, sigaction, sigvec, or signal ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, signause ("sigsuspend or signause Subroutine" on page 237) subroutine, **sigpending** ("sigpending Subroutine" on page 228) subroutine, **sigwait** ("sigwait Subroutine" on page 241) subroutine, sigsuspend ("sigsuspend or sigpause Subroutine" on page 237) subroutine.

Signal Management in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sigtimedwait and sigwaitinfo Subroutine

Purpose

Waits for a signal, and provides a mechanism for retrieving any queued value.

Library

Standard C Library (libc.a)

Threads Library (libpthreads.a)

Syntax

```
#include <signal.h>
int sigtimedwait (set, info, timeout)
const sigset t *set;
siginfo t *info;
const struct timespec *timeout;
int sigwaitinfo (set, info)
const sigset t *set;
siginfo t *info;
```

Description

The **sigwaitinfo** subroutine selects a pending signal from the set specified by the *set* parameter. If no signal in the set parameter is pending at the time of the call, the calling thread is suspended until one or more signals in the set parameter become pending or until it is interrupted by an unblocked, caught signal. If the wait was interrupted by an unblocked, caught signal, the subroutines will restart themselves.

The **sigwaitinfo** subroutine is functionally equivalent to the **sigwait** subroutine if the *info* argument is NULL. If the info argument is non-NULL, the sigwaitinfo subroutine is equivalent to the sigwait subroutine, except that the selected signal number is stored in the si_signo member, and the cause of the signal is stored in the si_code member of the info parameter. If any value is queued to the selected signal, the first such queued value is dequeued, and if the info argument is non-NULL, the value is stored in the si value member of the info parameter. If no further signals are queued for the selected signal, the pending indication for that signal is reset.

The sigtimedwait subroutine is equivalent to the sigwaitinfo subroutine except that if none of the signals specified by the set parameter are pending, the sigtimedwait subroutine waits for the time interval referenced by the timeout parameter. If the timespec structure pointed to by the timeout parameter contains a zero value and if none of the signals specified by the set parameter are pending, the **sigtimedwait** subroutine returns immediately with an error.

If there are multiple pending signals in the range SIGRTMIN to SIGRTMAX, the lowest numbered signal in that range will be selected.

Note: All signals in set should have been blocked prior to calling any of the **sigwait** subroutines.

Parameters

Specifies the pending signals that may be selected. set

Points to a **siginfo_t** in which additional signal information can be returned. info

Points to the timespec structure.

Return Values

Upon successful completion, the sigtimedwait and sigwaitinfo subroutines return the selected signal number. If unsuccessful, the sigtimedwait and sigwaitinfo subroutines return -1 and set the errno variable to indicate the error.

Error Codes

The sigtimedwait subroutine will fail if:

EAGAIN No signal specified by the set parameter was generated within the specified timeout period.

The **sigtimedwait** and **sigwaitinfo** subroutines may fail if:

EINVAL The set parameter is empty, or contains an invalid, non-catchable, or unsupported signal number.

The **sigtimedwait** subroutine may also fail when none of the selected signals are pending if:

EINVAL The timeout parameter specified a tv_nsec value less than zero or greater than or equal to 1000 million.

Related Information

"siggueue Subroutine" on page 230 and "sigwait Subroutine."

sigwait Subroutine

Purpose

Blocks the calling thread until a specified signal is received.

Library

Threads Library (libpthreads.a)

Syntax

```
#include </usr/include/sys/signal.h>
```

```
int sigwait (set, sig)
const sigset_t *set;
int *sig;
```

Description

The **sigwait** subroutine blocks the calling thread until one of the signal in the signal set set is received by the thread. sigwait returns an EINVAL error if it attempts to wait on SIGKILL(9), SIGSTOP(17), or SIGWAITING(39-AIX-specific).

The signal can be either sent directly to the thread, using the **pthread kill** subroutine, or to the process. In that case, the signal will be delivered to exactly one thread that has not blocked the signal.

Concurrent use of sigaction and sigwait subroutines on the same signal is forbidden.

Parameters

set Specifies the set of signals to wait on.

Points to where the received signal number will be stored. sig

Return Values

Upon successful completion, the received signal number is returned via the sig parameter, and 0 is returned. Otherwise, an error code is returned.

Error Code

The sigwait subroutine is unsuccessful if the following is true:

EINVAL The set parameter contains an invalid or unsupported signal number.

Related Information

The kill subroutine, pthread_kill subroutine, sigaction ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine, sigthreadmask ("sigthreadmask Subroutine" on page 238) subroutine.

Signal Management in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs .

sin, sinf, sinl, sind32, sind64, and sind128 Subroutine

Purpose

Computes the sine.

Syntax

```
#include <math.h>
double sin(x)
double x;
float sinf (x)
float x;
long double sinl (x)
long double x;
Decimal 32 sind 32 (x)
Decimal32 x;
_Decimal64 sind64 (x)
Decimal64 x;
Decimal 128 sind 128 (x)
Decimal 128 x;
```

Description

The sin, sinf, sinf, sind32, sind64, and sind128 subroutines compute the sine of the x parameter, measured in radians.

An application wishing to check for error situations should set the **errno** global variable to zero and call feclearexcept(FE ALL EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

- Floating-point value
- Floating-point value

Return Values

Upon successful completion, the sin, sinf, sinl, sind32, sind64, and sind128 subroutines return the sine

If x is NaN, a NaN is returned.

If x is ± 0 . x is returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

If x is $\pm \ln n$, a domain error occurs, and a NaN is returned.

Error Codes

The sin, sinf, and sinI subroutines lose accuracy when passed a large value for the x parameter. In the sin subroutine, for example, values of x that are greater than pi are argument-reduced by first dividing them by the machine value for 2 * pi, and then using the IEEE remainder of this division in place of x. Since the machine value of pi can only approximate its infinitely precise value, the remainder of x/(2 * pi) becomes less accurate as x becomes larger. Similar loss of accuracy occurs for the sinl subroutine during argument reduction of large arguments.

sin

When the x parameter is extremely large, these functions return 0 when there would be a complete loss of significance. In this case, a message indicating TLOSS error is printed on the standard error output. For less extreme values causing partial loss of significance, a PLOSS error is generated but no message is printed. In both cases, the errno global variable is set to a **ERANGE** value.

These error-handling procedures may be changed with the **matherr** subroutine when using the **libmsaa.a** (-Imsaa) library.

math.h in AIX 5L Version 5.3 Files Reference.

sinh, sinhf, sinhl, sinhd32, sinhd64, and sinhd128 Subroutines

Purpose

Computes hyperbolic sine.

Syntax

```
#include <math.h>
double sinh (x)
double x;
float sinhf (x)
float x;
long double sinhl (x)
long double x;
_Decimal32 sinhd32 (x)
_Decimal32 x;
Decimal64 sinhd64 (x)
Decimal64 x;
Decimal 128 sinhd128(x)
Decimal 128 x;
```

Description

The sinh, sinhf, sinhl, sinhd32, sinhd64, and sinhd128 subroutines compute the hyperbolic sine of the x parameter.

An application wishing to check for error situations should set the errno global variable to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

Specifies a double-precision floating-point value.

Return Values

Upon successful completion, the sinh, sinhf, sinhl, sinhd32, sinhd64, and sinhd128 subroutines return the hyperbolic sine of x.

If the result would cause an overflow, a range error occurs and ±HUGE VAL, ±HUGE VALF, ±HUGE VALL, ±HUGE VAL D32, ±HUGE VAL D64, and ±HUGE VAL D128 (with the same sign as x) is returned as appropriate for the type of the function.

If x is NaN, a NaN is returned.

If x is ± 0 or infinite, x is returned.

If x is subnormal, a range error may occur and x should be returned.

Error Codes

If the correct value overflows, the sinh, sinhf, sinhl, sinhd32, sinhd64, and sinhd128 subroutines return a correctly signed HUGE_VAL, and the errno global variable is set to ERANGE.

These error-handling procedures should be changed with the matherr subroutine when the libmsaa.a (-Imsaa) library is used.

128-Bit long double Floating-Point Format in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sleep, nsleep or usleep Subroutine

Purpose

Suspends a current process from execution.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
unsigned int sleep ( Seconds)
#include <sys/time.h>
int nsleep ( Rqtp, Rmtp)
struct timestruc_t *Rqtp, *Rmtp;
int usleep ( Useconds)
useconds_t Useconds;
```

Description

The nsleep subroutine is an extended form of the sleep subroutine. The sleep or nsleep subroutines suspend the current process until:

- The time interval specified by the Rqtp parameter elapses.
- A signal is delivered to the calling process that invokes a signal-catching function or terminates the process.
- The process is notified of an event through an event notification function.

The suspension time may be longer than requested due to the scheduling of other activity by the system. Upon return, the location specified by the Rmtp parameter shall be updated to contain the amount of time remaining in the interval, or 0 if the full interval has elapsed.

Parameters

Ratp Time interval specified for suspension of execution. **Rmtp** Specifies the time remaining on the interval timer or 0.

Seconds Specifies time interval in seconds. Useconds Specifies time interval in microseconds.

Compatibility Interfaces

The **sleep** and **usleep** subroutines are provided to ensure compatibility with older versions of the operating system, AT&T System V and BSD systems. They are implemented simply as front-ends to the nsleep subroutine. Programs linking with the libbsd.a library get a BSD compatible version of the sleep subroutine. The return value from the BSD compatible sleep subroutine has no significance and should be ignored.

Return Values

The nsleep, sleep, and usleep subroutines return a value of 0 if the requested time has elapsed.

If the nsleep subroutine returns a value of -1, the notification of a signal or event was received and the Rmtp parameter is updated to the requested time minus the time actually slept (unslept time), and the errno global variable is set.

If the sleep subroutine returns because of a premature arousal due to delivery of a signal, the return value will be the unslept amount (the requested time minus the time actually slept) in seconds.

Error Codes

If the nsleep subroutine fails, a value of -1 is returned and the errno global variable is set to one of the following error codes:

EINTR A signal was caught by the calling process and control has been returned from the signal-catching

routine, or the process has been notified of an event through an event notification function.

EINVAL The Rqtp parameter specified a nanosecond value less than zero or greater than or equal to one second.

The **sleep** subroutine is always successful and no return value is reserved to indicate an error.

Related Information

sockatmark Subroutine

Purpose

Determines whether a socket is at the out-of-band mark.

```
#include <sys/socket.h>
int sockatmark(s)
int s;
```

Description

The **sockatmark** subroutine determines whether the socket specified by the s parameter is at the out-of-band data mark. If the protocol for the socket supports out-of-band data by marking the stream with an out-of-band data mark, the **sockatmark** subroutine returns a 1 when all data preceding the mark has been read and the out-of-band data mark is the first element in the receive gueue. The sockatmark subroutine does not remove the mark from the stream.

The use of this subroutine between receive operations allows an application to determine which received data precedes the out-of-band data and which follows the out-of-band data. There is an inherent race condition in the use of this function. On an empty receive queue, the current read of the location might well be at the mark', but the system has no way of knowing that the next data segment that will arrive from the network will carry the mark, and sockatmark will return false The next read operation will silently consume the mark. Because of this, the sockatmark subroutine can only be used reliably when the application already knows that the out-of-band data has been seen by the system or that it is known that there is data waiting to be read at the socket.

Parameters

Specifies the socked to be checked.

Return Values

Upon successful completion, the sockatmark subroutine returns a value indicating whether the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data preceding the mark has been read, the return value is 1. If there is no mark, or if data precedes the mark in the receive queue, the sockatmark subroutine returns a 0. Otherwise, it returns a value of -1 and sets the errno global variable to indicate the error.

Error Codes

EBADF The s parameter is not a valid file descriptor.

ENOTTY The s parameter does not specify a descriptor for a socket.

SpmiAddSetHot Subroutine

Purpose

Adds a set of peer statistics values to a hotset.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
struct SpmiHotVals *SpmiAddSetHot(HotSet, StatName,
GrandParent, maxresp,
                                  threshold, frequency, feed_type,
```

```
except type, severity, trap no)
struct SpmiHotSet *HotSet;
char *StatName;
SpmiCxHdl GrandParent;
int maxresp:
int threshold;
int frequency;
int feed type;
int excp_type;
int severity;
int trap no;
```

Description

The SpmiAddSetHot subroutine adds a set of peer statistics to a hotset. The SpmiHotSet structure that provides the anchor point to the set must exist before the **SpmiAddSetHot** subroutine call can succeed.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a pointer to a valid structure of type SpmiHotSet as created by the SpmiCreateHotSet ("SpmiCreateHotSet" on page 250) subroutine call.

StatName

Specifies the name of the statistic within the subcontexts (peer contexts) of the context identified by the *GrandParent* parameter.

GrandParent

Specifies a valid SpmiCxHdI handle as obtained by another subroutine call. The handle must identify a context with at least one subcontext, which contains the statistic identified by the StatName parameter. If the context specified is one of the RTime contexts, no subcontext need to exist at the time the SpmiAddSetHot subroutine call is issued; the presence of the metric identified by the StatName parameter is checked against the context class description.

If the context specified has or may have multiple levels of instantiable context below it (such as the FS and RTime/ARM contexts), the metric is only searched for at the lowest context level. The SpmiHotSet created is a pseudo hotvals structure used to link together a peer group of SpmiHotValsstructures, which are created under the covers, one for each subcontext of the GrandParent context. In the case of RTime/ARM, if additional contexts are later added under the GrandParent contexts, additional hotsets are added to the peer group. This is transparent to the application program, except that the SpmiFirstHot, SpmiNextHot, and SpmiNextHotItem subroutine calls will return the peer group SpmiHotVals pointer rather than the pointer to the pseudo structure.

Note that specifying a specific volume group context (such as FS/rootvg) or a specific application context (such as RTime/ARN/armpeek) is still valid and won't involve creation of pseudo SpmiHotVals structures.

maxresp

Must be non-zero if excp type specifies that exceptions or SNMP traps must be generated. If specified as zero, indicates that all SPMIHotItems that meet the criteria specified by threshold must be returned, up-to a maximum of maxresp items. If both exceptions/traps and feeds are requested, the maxresp value is used to cap the number of exceptions/alerts as well as the number of items returned. If feed type is specified as SiHotAlways, the maxresp parameter is still used to return at most maxresp items.

Where the GrandParent argument specifies a context that has multiple levels of instantiable contexts below it, the maxresp is applied to each of the lowest level contexts above the the actual peer contexts at a time. For example, if the GrandParent context is FS (file systems) and the system has three volume groups, then a maxresp value of 2 could cause up to a maximum of 2 x 3 = 6 responses to be generated.

threshold

Must be non-zero if excp_type specifies that exceptions or SNMP traps must be generated. If specified as zero, indicates that all values read qualify to be returned in feeds. The value specified is compared to the data value read for each peer statistic. If the data value exceeds the threshold, it qualifies to be returned as an SpmiHotItems element in the SpmiHotVals structure. If the threshold is specified as a negative value, the value qualifies if it is lower than the numeric value of threshold. If feed_type is specified as SiHotAlways, the threshold value is ignored for feeds. For peer statistics of type SiCounter, the threshold must be specified as a rate per second; for SiQuantity statistics the threshold is specified as a level.

frequency

Must be non-zero if excp type specifies that exceptions or SNMP traps must be generated. Ignored for feeds. Specifies the minimum number of minutes that must expire between any two exceptions/traps generated from this SpmiHotVals structure. This value must be specified as no less than 5 minutes.

feed type

Specifies if feeds of SpmiHotItems should be returned for this SpmiHotVals structure. The following values are valid:

SiHotNoFeed

No feeds should be generated

SiHotThreshold

Feeds are controlled by threshold.

SiHotAlways

All values, up-to a maximum of *maxresp* must be returned as feeds.

excp_type

Controls the generation of exception data packets and/or the generation of SNMP Traps from xmservd. Note that these types of packets and traps can only actually be sent if xmservd is running. Because of this, exception packets and SNMP traps are only generated as long as xmservd is active. Traps can only be generated on AIX systems. The conditions for generating exceptions and traps are controlled by the threshold and frequency parameters. The following values are valid for excp_type:

SiNoHotException

Generate neither exceptions not traps.

SiHotException

Generate exceptions but not traps.

SiHotTrap

Generate SNMP traps but not exceptions.

SiHotBoth

Generate both exceptions and SNMP traps.

severity

Required to be positive and greater than zero if exceptions are generated, otherwise specify as zero. Used to assign a severity code to the exception for display by **exmon**.

trap_no

Required to be positive and greater than zero if SNMP traps are generated, otherwise specify as zero. Used to assign the trap number in the generated SNMP trap.

Return Values

The SpmiAddSetHot subroutine returns a pointer to a structure of type SpmiHotVals if successful. If unsuccessful, the subroutine returns a NULL value.

Programming Notes

The SpmiAddSetHot functions in a straight forward manner and as described previously in all cases where the GrandParent context is a context that has only one level of instantiable contexts below it. This covers most context types such as CPU, Disk, LAN, etc. In a few cases, currently only the FS (file system) and RTime/ARM (application response) contexts, the SPMI works by creating pseudo-hotvals structures that effectively expand the hotset. These pseudo-hotvals structures are created either at the time the SpmiAddSetHot call is issued or when new subcontexts are created for a context that's already the *GrandParent* of a hotvals peer set. For example:

When a peer set is created for RTime/ARM, maybe only a few or no subcontexts of this context exists. If two applications were defined at this point, say **checking** and **savings**, one valsset would be created for the RTime/ARM context and a pseudo-valsset for each of RTime/ARM/checking and RTime/ARM/savings. As new applications are added to the RTime/ARM contexts, new pseudo-valssets are automatically added to the hotset.

Pseudo-valssets represent an implementation convenience and also helps minimize the impact of retrieving and presenting data for hotsets. As far as the caller of the RSiGetHotItem subroutine call is concerned, it is completely transparent. All this caller will ever see is the real hotvals structure. That is not the case for callers of SpmiFirstHot, SpmiNextHot, and SpmiNextHotltem. All of these subroutines will return pseudo-valssets and the calling program should be prepared to handle this.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiCreateHotSet

Purpose

Creates an empty hotset.

Library

#include sys/Spmidef.h struct SpmiHotSet *SpmiCreateHotSet()

Description

The SpmiCreateHotSet subroutine creates an empty hotset and returns a pointer to an SpmiHotSet structure. This structure provides the anchor point for a hotset and must exist before the SpmiAddSetHot subroutine can be successfully called.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Return Values

The SpmiCreateHotSet subroutine returns a pointer to a structure of type SpmiHotSet if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

SpmiCreateStatSet Subroutine

Purpose

Creates an empty set of statistics.

Library

#include sys/Spmidef.h struct SpmiStatSet *SpmiCreateStatSet()

Description

The SpmiCreateStatSet subroutine creates an empty set of statistics and returns a pointer to an SpmiStatSet structure.

The **SpmiStatSet** structure provides the anchor point to a set of statistics and must exist before the SpmiPathAddSetStat subroutine can be successfully called.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Return Values

The SpmiCreateStatSet subroutine returns a pointer to a structure of type SpmiStatSet if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

SpmiDdsAddCx Subroutine

Purpose

Adds a volatile context to the contexts defined by an application.

Library

```
#include sys/Spmidef.h
char *SpmiDdsAddCx(Ix, Path, Descr, Asnno)
ushort Ix;
char *Path, *Descr;
int Asnno;
```

Description

The SpmiDdsAddCx subroutine uses the shared memory area to inform the SPMI that a context is available to be added to the context hierarchy, moves a copy of the context to shared memory, and allocates memory for the data area.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

ĺχ

Specifies the element number of the added context in the table of dynamic contexts. No context can be added if the table of dynamic contexts has not been defined in the SpmiDdsInit subroutine call. The first element of the table is element number 0.

Path

Specifies the full path name of the context to be added. If the context is not at the top-level, the parent context must already exist.

Descr

Provides the description of the context to be added as it will be presented to data consumers.

Asnno

Specifies the ASN.1 number to be assigned to the new context. All subcontexts on the same level as the new context must have unique ASN.1 numbers. Typically, each time the SpmiDdsAddCx subroutine adds a subcontext to the same parent context, the Asnno parameter is incremented. See Making Dynamic Data-Supplier Statistics Unique for more information about ASN.1 numbers.

Return Values

If successful, the SpmiDdsAddCx subroutine returns the address of the shared memory data area. If an error occurs, an error text is placed in the external **SpmiErrmsg** character array, and the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiDdsDelCx Subroutine

Purpose

Deletes a volatile context.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiDdsDelCx(Area) char *Area;

Description

The SpmiDdsDelCx subroutine informs the SPMI that a previously added, volatile context should be deleted.

If the SPMI has not detected that the context to delete was previously added dynamically, the SpmiDdsDelCx subroutine removes the context from the list of to-be-added contexts and returns the allocated shared memory to the free list. Otherwise, the SpmiDdsDelCx subroutine indicates to the SPMI that a context and its associated statistics must be removed from the context hierarchy and any allocated shared memory must be returned to the free list.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

Area

Specifies the address of the previously allocated shared memory data area as returned by an SpmiDdsAddCx subroutine call.

Return Values

If successful, the SpmiDdsDelCx subroutine returns a value of 0. If an error occurs, an error text is placed in the external SpmiErrmsg character array, and the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

extern char SpmiErrmsg[];

extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

Related Information

For related information, see:

- "SpmiDdsAddCx Subroutine" on page 252

SpmiDdsInit Subroutine

Purpose

Establishes a program as a dynamic data-supplier (DDS) program.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
SpmiShare *SpmiDdsInit(CxTab, CxCnt, IxTab, IxCnt,
FileName)
cx_create *CxTab, *IxTab;
int CxCnt, IxCnt;
char *FileName;
```

Description

The SpmiDdsInit subroutine establishes a program as a dynamic data-supplier (DDS) program. To do so, the SpmiDdsInit subroutine:

- 1. Determines the size of the shared memory required and creates a shared memory segment of that
- 2. Moves all static contexts and all statistics referenced by those contexts to the shared memory.
- 3. Calls the SPMI and requests it to add all of the DDS static contexts to the context tree.

Notes:

- 1. The SpmiDdsInit subroutine issues an SpmiInit subroutine call if the application program has not issued one.
- 2. If the calling program uses shared memory for other purposes, including memory mapping of files, the SpmiDdsInit or the SpmiInit subroutine call must be issued before access is established to other shared memory areas.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxTab

Specifies a pointer to the table of nonvolatile contexts to be added.

CxCnt

Specifies the number of elements in the table of nonvolatile contexts. Use the CX L macro to find this value.

IxTab

Specifies a pointer to the table of volatile contexts the program may want to add later. If no contexts are defined, specify NULL.

IxCnt

Specifies the number of elements in the table of volatile contexts. Use the CX_L macro to find this value. If no contexts are defined, specify 0.

FileName

Specifies the fully qualified path and file name to use when creating the shared memory segment. At execution time, if the file exists, the process running the DDS must be able to write to the file. Otherwise, the SpmiDdsInit subroutine call does not succeed. If the file does not exist, it is created. If the file cannot be created, the subroutine returns an error. If the file name includes directories that do not exist, the subroutine returns an error.

For non-AIX systems, a sixth argument is required to inform the SPMI how much memory to allocate in the DDS shared memory segment. This is not required for AIX systems because facilities exist to expand a memory allocation in shared memory. The sixth argument is:

size

Size in bytes of the shared memory area to allocate for the DDS program. This parameter is of type int.

Return Values

If successful, the SpmiDdsInit subroutine returns the address of the shared memory control area. If an error occurs, an error text is placed in the external SpmiErrmsg character array, and the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the **SpmiErrno** variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiDelSetHot Subroutine

Purpose

Removes a single set of peer statistics from a hotset.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiDelSetHot(HotSet, HotVal) struct SpmiHotSet *HotSet; struct SpmiHotVals *HotVal;

Description

The **SpmiDelSetHot** subroutine removes a single set of peer statistics, identified by the *HotVal* parameter, from a hotset, identified by the *HotSet* parameter.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a pointer to a valid structure of type SpmiHotSet, as created by the "SpmiCreateHotSet" on page 250 subroutine call.

HotVal

Specifies a pointer to a valid structure of type SpmiHotVals, as created by the "SpmiAddSetHot Subroutine" on page 247 subroutine call. You cannot specify an SpmiHotVals that was internally generated by the SPMI library code as described under the GrandParent parameter to SpmiAddSetHot.

Return Values

The SpmiDelSetHot subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiDelSetStat Subroutine

Purpose

Removes a single statistic from a set of statistics.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiDelSetStat(StatSet, StatVal) struct SpmiStatSet *StatSet; struct SpmiStatVals *StatVal;

Description

The SpmiDelSetStat subroutine removes a single statistic, identified by the StatVal parameter, from a set of statistics, identified by the StatSet parameter.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the "SpmiCreateStatSet Subroutine" on page 251 subroutine call.

StatVal

Specifies a pointer to a valid structure of type SpmiStatVals as created by the "SpmiPathAddSetStat Subroutine" on page 284 subroutine call.

Return Values

The SpmiDelSetStat subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsg** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiExit Subroutine

Purpose

Terminates a dynamic data supplier (DDS) or local data consumer program's association with the SPMI, and releases allocated memory.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h void SpmiExit()

Description

A successful "Spmilnit Subroutine" on page 273 or "SpmiDdsInit Subroutine" on page 255 call allocates shared memory. Therefore, a Dynamic Data Supplier (DDS) program that has issued a successful Spmilnit or SpmiDdsInit subroutine call should issue an SpmiExit subroutine call before the program exits the SPMI. Allocated memory is not released until the program issues an SpmiExit subroutine call.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

Related Information

For related information, see:

- "Spmilnit Subroutine" on page 273

SpmiFirstCx Subroutine

Purpose

Locates the first subcontext of a context.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiCxLink *SpmiFirstCx(CxHandle) SpmiCxHdl CxHandle;

Description

The SpmiFirstCx subroutine locates the first subcontext of a context. The subroutine returns a NULL value if no subcontexts are found.

The structure pointed to by the returned pointer contains a handle to access the contents of the corresponding SpmiCx structure through the SpmiGetCx subroutine call.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxHandle

Specifies a valid **SpmiCxHdI** handle as obtained by another subroutine call.

Return Values

The SpmiFirstCx subroutine returns a pointer to an SpmiCxLink structure if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

SpmiFirstHot Subroutine

Purpose

Locates the first of the sets of peer statistics belonging to a hotset.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiHotVals *SpmiFirstHot(HotSet) struct SpmiHotSet HotSet;

Description

The SpmiFirstHot subroutine locates the first of the SpmiHotVals structures belonging to the specified SpmiHotSet. Using the returned pointer, the SpmiHotSet can then either be decoded directly by the calling program, or it can be used to specify the starting point for a subsequent SpmiNextHotItem subroutine call. The SpmiFirstHot subroutine should only be executed after a successful call to the SpmiGetHotSet subroutine.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a valid SpmiHotSet structure as obtained by another subroutine call.

Return Values

The SpmiFirstHot subroutine returns a pointer to a structure of type SpmiHotVals structure if successful. If unsuccessful, the subroutine returns a NULL value. A returned pointer may refer to a pseudo-hotvals structure as described in the **SpmiAddSetHot** subroutine.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

SpmiFirstStat Subroutine

Purpose

Locates the first of the statistics belonging to a context.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiStatLink *SpmiFirstStat(CxHandle) SpmiCxHdl CxHandle;

Description

The SpmiFirstStat subroutine locates the first of the statistics belonging to a context. The subroutine returns a NULL value if no statistics are found.

The structure pointed to by the returned pointer contains a handle to access the contents of the corresponding SpmiStat structure through the "SpmiGetStat Subroutine" on page 269 call.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxHandle

Specifies a valid SpmiCxHdI handle as obtained by another subroutine call.

Return Values

The SpmiFirstStat subroutine returns a pointer to a structure of type SpmiStatLink if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsg** character array is empty. If an error is detected, the **SpmiErrno** variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiFirstVals Subroutine

Purpose

Returns a pointer to the first **SpmiStatVals** structure belonging to a set of statistics.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiStatVals *SpmiFirstVals(StatSet) struct SpmiStatSet *StatSet;

Description

The SpmiFirstVals subroutine returns a pointer to the first SpmiStatVals structure belonging to the set of statistics identified by the StatSet parameter. SpmiStatVals structures are accessed in reverse order so

the last statistic added to the set of statistics is the first one returned. This subroutine call should only be issued after an SpmiGetStatSet subroutine has been issued against the statset.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the SpmiCreateStatSet subroutine call.

Return Values

The SpmiFirstVals subroutine returns a pointer to an SpmiStatVals structure if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsg** character array is empty. If an error is detected, the **SpmiErrno** variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiFreeHotSet Subroutine

Purpose

Erases a hotset.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiFreeHotSet(HotSet) struct SpmiHotSet *HotSet;

Description

The SpmiFreeHotSet subroutine erases the hotset identified by the HotSet parameter. All SpmiHotVals structures chained off the SpmiHotSet structure are deleted before the set itself is deleted.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a pointer to a valid structure of type SpmiHotSet as created by the "SpmiCreateHotSet" on page 250 subroutine call.

Return Values

The SpmiFreeHotSet subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiFreeStatSet Subroutine

Purpose

Erases a set of statistics.

Library

#include sys/Spmidef.h int SpmiFreeStatSet(StatSet) struct SpmiStatSet *StatSet;

Description

The **SpmiFreeStatSet** subroutine erases the set of statistics identified by the *StatSet* parameter. All SpmiStatVals structures chained off the SpmiStatSet structure are deleted before the set itself is deleted.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the SpmiCreateStatSet subroutine call.

Return Values

The SpmiFreeStatSet subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

SpmiGetCx Subroutine

Purpose

Returns a pointer to the **SpmiCx** structure corresponding to a specified context handle.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiCx *SpmiGetCx(CxHandle) SpmiCxHdl CxHandle;

Description

The **SpmiGetCx** subroutine returns a pointer to the **SpmiCx** structure corresponding to the context handle identified by the CxHandle parameter.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxHandle

Specifies a valid **SpmiCxHdI** handle as obtained by another subroutine call.

Return Values

The **SpmiGetCx** subroutine returns a a pointer to an **SpmiCx** data structure if successful. If unsuccessful, the subroutine returns NULL.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

SpmiGetHotSet Subroutine

Purpose

Requests the SPMI to read the data values for all sets of peer statistics belonging to a specified SpmiHotSet.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiGetHotSet(HotSet, Force); struct SpmiHotSet *HotSet; boolean Force;

Description

The SpmiGetHotSet subroutine requests the SPMI to read the data values for all peer sets of statistics belonging to the SpmiHotSet identified by the HotSet parameter. The Force parameter is used to force the data values to be refreshed from their source.

The Force parameter works by resetting a switch held internally in the SPMI for all SpmiStatVals and SpmiHotVals structures, regardless of the SpmiStatSets and SpmiHotSets to which they belong. Whenever the data value for a peer statistic is requested, this switch is checked. If the switch is set, the SPMI reads the latest data value from the original data source. If the switch is not set, the SPMI reads the data value stored in the SpmiHotVals structure. This mechanism allows a program to synchronize and minimize the number of times values are retrieved from the source. One method programs can use is to ensure the force request is not issued more than once per elapsed amount of time.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a pointer to a valid structure of type SpmiHotSet as created by the "SpmiCreateHotSet" on page 250 subroutine call.

Force

If set to true, forces a refresh from the original source before the SPMI reads the data values for the set. If set to false, causes the SPMI to read the data values as they were previously retrieved from the data source.

When the force argument is set true, the effect is that of marking all statistics known by the SPMI as obsolete, which causes the SPMI to refresh all requested statistics from kernel memory or other sources. As each statistic is refreshed, the obsolete mark is reset. Statistics that are not part of the **HotSet** specified in the subroutine call remain marked as obsolete. Therefore, if an application repetitively issues a series of, SpmiGetHotSet and SpmiGetStatSet subroutine calls for multiple hotsets and statsets, each time, only the first such call need set the force argument to true.

Return Values

The SpmiGetHotSet subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsg** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiGetStat Subroutine

Purpose

Returns a pointer to the **SpmiStat** structure corresponding to a specified statistic handle.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiStat *SpmiGetStat(StatHandle) SpmiStatHdl StatHandle;

Description

The SpmiGetStat subroutine returns a pointer to the SpmiStat structure corresponding to the statistic handle identified by the StatHandle parameter.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatHandle

Specifies a valid SpmiStatHdI handle as obtained by another subroutine call.

Return Values

The SpmiGetStat subroutine returns a pointer to a structure of type SpmiStat if successful. If unsuccessful, the subroutine returns a NULL value.

Return Values

The SpmiGetStat subroutine returns a pointer to a structure of type SpmiStat if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsg** character array is empty. If an error is detected, the **SpmiErrno** variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

SpmiGetStatSet Subroutine

Purpose

Requests the SPMI to read the data values for all statistics belonging to a specified set.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiGetStatSet(StatSet, Force); struct SpmiStatSet *StatSet; boolean Force;

Description

The SpmiGetStatSet subroutine requests the SPMI to read the data values for all statistics belonging to the SpmiStatSet identified by the StatSet parameter. The Force parameter is used to force the data values to be refreshed from their source.

The Force parameter works by resetting a switch held internally in the SPMI for all SpmiStatVals and SpmiHotVals structures, regardless of the SpmiStatSets and SpmiHotSets to which they belong. Whenever the data value for a statistic is requested, this switch is checked. If the switch is set, the SPMI reads the latest data value from the original data source. If the switch is not set, the SPMI reads the data value stored for the SpmiStatVals structure. This mechanism allows a program to synchronize and minimize the number of times values are retrieved from the source. One method is to ensure the force request is not issued more than once per elapsed amount of time.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the SpmiCreateStatSet subroutine call.

Force

If set to true, forces a refresh from the original source before the SPMI reads the data values for the set. If set to false, causes the SPMI to read the data values as they were previously retrieved from the data source.

When the force argument is set true, the effect is that of marking all statistics known by the SPMI as obsolete, which causes the SPMI to refresh all requested statistics from kernel memory or other sources. As each statistic is refreshed, the obsolete mark is reset. Statistics that are not part of the StatSet specified in the subroutine call remain marked as obsolete. Therefore, if an application repetitively issues the SpmiGetStatSet and SpmiGetHotSet subroutine calls for multiple statsets and hotsets, each time, only the first such call need set the force argument to true.

Return Values

The SpmiGetStatSet subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

SpmiGetValue Subroutine

Purpose

Returns a decoded value based on the type of data value extracted from the data field of an SpmiStatVals structure.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h float SpmiGetValue(StatSet, StatVal) struct SpmiStatSet *StatSet; struct SpmiStatVals *StatVal;

Description

The SpmiGetValue subroutine performs the following steps:

- 1. Verifies that an SpmiStatVals structure exists in the set of statistics identified by the StatSet parameter.
- 2. Determines the format of the data field as being either SiFloat or SiLong and extracts the data value for further processing.
- 3. Determines the data value as being of either type SiQuantity or type SiCounter.
- 4. If the data value is of type SiQuantity, returns the val field of the SpmiStatVals structure.
- 5. If the data value is of type SiCounter, returns the value of the val_change field of the SpmiStatVals structure divided by the elapsed number of seconds since the previous time a data value was requested for this set of statistics.

This subroutine call should only be issued after an SpmiGetStatSet subroutine has been issued against the statset.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the SpmiCreateStatSet subroutine call.

StatVal

Specifies a pointer to a valid structure of type SpmiStatVals as created by the SpmiPathAddSetStat subroutine call or returned by the SpmiFirstVals or SpmiNextVals subroutine calls.

Return Values

The SpmiGetValue subroutine returns the decoded value if successful. If unsuccessful, the subroutine returns a negative value that has a numerical value of at least 1.1.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Spmilnit Subroutine

Purpose

Initializes the SPMI for a local data consumer program.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiInit (TimeOut) int TimeOut;

Description

The Spmilnit subroutine initializes the SPMI. During SPMI initialization, a memory segment is allocated and the application program obtains basic addressability to that segment. An application program must issue the Spmilnit subroutine call before issuing any other subroutine calls to the SPMI.

Note: The Spmilnit subroutine is automatically issued by the SpmiDdsInit subroutine call. Successive Spmilnit subroutine calls are ignored.

Note: If the calling program uses shared memory for other purposes, including memory mapping of files, the Spmilnit subroutine call must be issued before access is established to other shared memory areas.

The SPMI entry point called by the **Spmilnit** subroutine assigns a segment register to be used by the SPMI subroutines (and the application program) for accessing common shared memory and establishes the access mode to the common shared memory segment. After SPMI initialization, the SPMI subroutines are able to access the common shared memory segment in read-only mode.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

TimeOut

Specifies the number of seconds the SPMI waits for a Dynamic Data Supplier (DDS) program to update its shared memory segment. If a DDS program does not update its shared memory segment in the time specified, the SPMI assumes that the DDS program has terminated or disconnected from shared memory and removes all contexts and statistics added by the DDS program.

The SPMI saves the largest *TimeOut* value received from the programs that invoke the SPMI. The TimeOut value must be zero or must be greater than or equal to 15 seconds and less than or equal to 600 seconds. A value of zero overrides any other value from any other program that invokes the SPMI and disables the checking for terminated DDS programs.

Return Values

The Spmilnit subroutine returns a value of 0 if successful. If unsuccessful, the subroutine returns a nonzero value. If a nonzero value is returned, the application program should not attempt to issue additional SPMI subroutine calls.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

Spmilnstantiate Subroutine

Purpose

Explicitly instantiates the subcontexts of an instantiable context.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h int SpmiInstantiate(CxHandle) SpmiCxHdl CxHandle;

Description

The **Spmilnstantiate** subroutine explicitly instantiates the subcontexts of an instantiable context. If the context is not instantiable, do not call the **Spmilnstantiate** subroutine.

An instantiation is done implicitly by the SpmiPathGetCx and SpmiFirstCx subroutine calls. Therefore, application programs usually do not need to instantiate explicitly.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxHandle

Specifies a valid context handle SpmiCxHdI as obtained by another subroutine call.

Return Values

The **Spmilnstantiate** subroutine returns a value of 0 if successful. If the context is not instantiable, the subroutine returns a nonzero value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- · extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiNextCx Subroutine

Purpose

Locates the next subcontext of a context.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiCxLink *SpmiNextCx(CxLink)struct SpmiCxLink *CxLink;

Description

The SpmiNextCx subroutine locates the next subcontext of a context, taking the context identified by the CxLink parameter as the current subcontext. The subroutine returns a NULL value if no further subcontexts are found.

The structure pointed to by the returned pointer contains an SpmiCxHdI handle to access the contents of the corresponding **SpmiCx** structure through the **SpmiGetCx** subroutine call.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxLink

Specifies a pointer to a valid SpmiCxLink structure as obtained by a previous SpmiFirstCx subroutine.

Return Values

The SpmiNextCx subroutine returns a pointer to a structure of type SpmiCxLink if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the **SpmiErrno** variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

SpmiNextHot Subroutine

Purpose

Locates the next set of peer statistics SpmiHotVals belonging to an SpmiHotSet.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
struct SpmiHotVals *SpmiNextHot(HotSet, HotVals)
struct SpmiHotSet *HotSet;
struct SpmiHotVals *HotVals;
```

Description

The **SpmiNextHot** subroutine locates the next **SpmiHotVals** structure belonging to an **SpmiHotSet**, taking the set of peer statistics identified by the HotVals parameter as the current one. The subroutine returns a NULL value if no further SpmiHotVals structures are found. The SpmiNextHot subroutine should only be executed after a successful call to the SpmiGetHotSet subroutine and (usually, but not necessarily) a call to the SpmiFirstHot subroutine and one or more subsequent calls to SpmiNextHot.

The subroutine allows the application programmer to position at the next set of peer statistics in preparation for using the SpmiNextHotItem subroutine call to traverse this peer set's array of SpmiHotItems elements. Use of this subroutine is only necessary if it is desired to skip over some SpmiHotVals structures in an SpmiHotSet. Under most circumstances, the SpmiNextHotItem will be the sole means of accessing all elements of the **SpmiHotItems** arrays of all peer sets belonging to an SpmiHotSet.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a valid pointer to an SpmiHotSet structure as obtained by a previous "SpmiCreateHotSet" on page 250 call.

HotVals

Specifies a pointer to an SpmiHotVals structure as returned by a previous SpmiFirstHot or SpmiNextHot subroutine call or as returned by an SpmiAddSetHot subroutine call.

Return Values

The **SpmiNextHot** subroutine returns a pointer to the next **SpmiHotVals** structure within the hotset. If no more SpmiHotVals structures are available, the subroutine returns a NULL value. A returned pointer may refer to a pseudo-hotvals structure as described the **SpmiAddSetHot** subroutine.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

Related Information

For more information, see:

- · "SpmiFirstHot Subroutine" on page 261

- "SpmiNextHotItem Subroutine."
- Data Access Structures and Handles, HotSets

SpmiNextHotItem Subroutine

Purpose

Locates and decodes the next **SpmiHotItems** element at the current position in an **SpmiHotSet**.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
struct SpmiHotVals *SpmiNextHotItem(HotSet, HotVals, index,
value, name)
struct SpmiHotSet *HotSet;
struct SpmiHotVals *HotVals;
int *index:
float *value;
char **name;
```

Description

The SpmiNextHotItem subroutine locates the next SpmiHotItems structure belonging to an SpmiHotSet, taking the element identified by the HotVals and index parameters as the current one. The subroutine returns a NULL value if no further SpmiHotItems structures are found. The SpmiNextHotItem subroutine should only be executed after a successful call to the **SpmiGetHotSet** subroutine.

The SpmiNextHotItem subroutine is designed to be used for walking all SpmiHotItems elements returned by a call to the SpmiGetHotSet subroutine, visiting the SpmiHotVals structures one by one. By feeding the returned value and the updated integer pointed to by index back to the next call, this can be done in a tight loop. Successful calls to SpmiNextHotItem will decode each SpmiHotItems element and return the data value in value and the name of the peer context that owns the corresponding statistic in name.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

HotSet

Specifies a valid pointer to an SpmiHotSet structure as obtained by a previous "SpmiCreateHotSet" on page 250 call.

HotVals

Specifies a pointer to an SpmiHotVals structure as returned by a previousSpmiNextHotItem, SpmiFirstHot, or SpmiNextHot subroutine call or as returned by an SpmiAddSetHot subroutine call. If this parameter is specified as NULL, the first SpmiHotVals structure of the SpmiHotSet is used and the *index* parameter is assumed to be set to zero, regardless of its actual value.

index

A pointer to an integer that contains the desired element number in the SpmiHotItems array of the SpmiHotVals structure specified by HotVals. A value of zero points to the first element. When the SpmiNextHotItem subroutine returns, the integer contain the index of the next SpmiHotItems element within the returned SpmiHotVals structure. If the last element of the array is decoded, the value in the integer will point beyond the end of the array, and the SpmiHotVals pointer returned will point to the peer set, which has now been completely decoded. By passing the returned SpmiHotVals pointer and the index parameter to the next call to SpmiNextHotItem, the subroutine will detect this and proceed to the first SpmiHotItems element of the next SpmiHotVals structure if one exists.

value

A pointer to a float variable. A successful call will return the decoded data value for the statistic. Before the value is returned, the **SpmiNextHotItem** function:

- Determines the format of the data field as being either SiFloat or SiLong and extracts the data value for further processing.
- Determines the data value as being either type **SiQuantity** or type **SiCounter** and performs one of the actions listed here:
 - If the data value is of type **SiQuantity**, the subroutine returns the **val** field of the SpmiHotItems structure.
 - If the data value is of type **SiCounter**, the subroutine returns the value of the **val** change field of the SpmiHotItems structure divided by the elapsed number of seconds since the previous time a data value was requested for this set of statistics.

name

A pointer to a character pointer. A successful call will return a pointer to the name of the peer context for which the data value was read.

Return Values

The SpmiNextHotItem subroutine returns a pointer to the current SpmiHotVals structure within the hotset. If no more SpmiHotVals structures are available, the subroutine returns a NULL value. The structure returned contains the data, such as threshold, which may be relevant for presentation of the results of an SpmiGetHotSet subroutine call to end-users. A returned pointer may refer to a pseudo-hotvals structure as described in the SpmiAddSetHot subroutine.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

SpmiNextStat Subroutine

Purpose

Locates the next statistic belonging to a context.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
struct SpmiStatLink *SpmiNextStat(StatLink)
struct SpmiStatLink *StatLink;
```

Description

The SpmiNextStat subroutine locates the next statistic belonging to a context, taking the statistic identified by the StatLink parameter as the current statistic. The subroutine returns a NULL value if no further statistics are found.

The structure pointed to by the returned pointer contains an SpmiStatHdI handle to access the contents of the corresponding SpmiStat structure through the "SpmiGetStat Subroutine" on page 269 call.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatLink

Specifies a valid pointer to a SpmiStatLink structure as obtained by a previous "SpmiFirstStat Subroutine" on page 262 call.

Return Values

The SpmiNextStat subroutine returns a pointer to a structure of type SpmiStatLink if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsg** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

Declares the subroutines, data structures, handles, and macros that an application program can use to access the SPMI.

SpmiNextVals Subroutine

Purpose

Returns a pointer to the next **SpmiStatVals** structure in a set of statistics.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
struct SpmiStatVals *SpmiNextVals(StatSet, StatVal)
struct SpmiStatSet *StatSet;
struct SpmiStatVals *StatVal;
```

Description

The **SpmiNextVals** subroutine returns a pointer to the next **SpmiStatVals** structure in a set of statistics, taking the structure identified by the StatVal parameter as the current structure. The SpmiStatVals structures are accessed in reverse order so the statistic added before the current one is returned. This subroutine call should only be issued after an SpmiGetStatSet subroutine has been issued against the statset.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the "SpmiCreateStatSet Subroutine" on page 251 call.

StatVal

Specifies a pointer to a valid structure of type SpmiStatVals as created by the "SpmiPathAddSetStat Subroutine" on page 284 subroutine call or returned by a previous "SpmiFirstVals Subroutine" on page 263 or SpmiNextVals subroutine call.

Return Values

The SpmiNextVals subroutine returns a pointer to a SpmiStatVals structure if successful. If unsuccessful, the subroutine returns a NULL value.

SpmiNextValue Subroutine

Purpose

Returns either the first SpmiStatVals structure in a set of statistics or the next SpmiStatVals structure in a set of statistics and a decoded value based on the type of data value extracted from the data field of an SpmiStatVals structure.

Library

SPMI Library (libSpmi.a)

Syntax

```
#include sys/Spmidef.h
struct SpmiStatVals*SpmiNextValue( StatSet, StatVal, value)
struct SpmiStatSet *StatSet;
struct SpmiStatVals *StatVal;
float *value;
```

Description

Instead of issuing subroutine calls to "SpmiFirstVals Subroutine" on page 263 / "SpmiNextVals Subroutine" on page 281 (to get the first or next SpmiStatVals structure) followed by calls to SpmiGetValue (to get the decoded value from the SpmiStatVals structure), the SpmiNextValue subroutine returns both in one call. This subroutine call returns a pointer to the first SpmiStatVals structure belonging to the StatSet parameter if the StatVal parameter is NULL. If the StatVal parameter is not NULL, the next SpmiStatVals structure is returned, taking the structure identified by the StatVal parameter as the current structure. The data value corresponding to the returned SpmiStatVals structure is decoded and returned in the field pointed to by the value argument. In decoding the data value, the subroutine does the following:

- Determines the format of the data field as being either SiFloat or SiLong and extracts the data value for further processing.
- · Determines the data value as being either type SiQuantity or type SiCounter and performs one of the actions listed here:
 - If the data value is of type SiQuantity, the subroutine returns the val field of the SpmiStatVals structure.
 - If the data value is of type **SiCounter**, the subroutine returns the value of the **val** change field of the SpmiStatVals structure divided by the elapsed number of seconds since the previous time a data value was requested for this set of statistics.

Note: This subroutine call should only be issued after an "SpmiGetStatSet Subroutine" on page 270 has been issued against the statset.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the "SpmiCreateStatSet Subroutine" on page 251 call.

StatVal

Specifies either a NULL pointer or a pointer to a valid structure of type SpmiStatVals as created by the "SpmiPathAddSetStat Subroutine" on page 284 call or returned by a previous SpmiNextValue subroutine call. If StatVal is NULL, then the first SpmiStatVals pointer belonging to the set of statistics pointed to by StatSet is returned.

value A pointer used to return a decoded value based on the type of data value extracted from the data field of the returned SpmiStatVals structure.

Return Value

The SpmiNextValue subroutine returns a pointer to a SpmiStatVals structure if successful. If unsuccessful, the subroutine returns a NULL value.

If the StatVal parameter is:

NULL

The first **SpmiStatVals** structure belonging to the **StatSet** parameter is returned.

not NULL

The next SpmiStatVals structure after the structure identified by the StatVal parameter is returned and the value parameter is used to return a decoded value based on the type of data value extracted from the data field of the returned **SpmiStatVals** structure.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Programming Notes

The SpmiNextValue subroutine maintains internal state information so that retrieval of the next data value from a statset can be done without traversing linked lists of data structures. The stats information is kept separate for each process, but is shared by all threads of a process.

If the subroutine is accessed from multiple threads, the state information is useless and the performance advantage is lost. The same is true if the program is simultaneously accessing two or more statsets. To benefit from the performance advantage of the SpmiNextValue subroutine, a program should retrieve all values in order from one stat set before retrieving values from the next statset.

The implementation of the subroutine allows a program to retrieve data values beginning at any point in the statset if the SpmiStatVals pointer is known. Doing so will cause a linked list traversal. If subsequent invocations of SpmiNextValue uses the value returned from the first and following invocation as their second argument, the traversal of the link list can be avoided.

It should be noted that the value returned by a successful **SpmiNextValue** invocation is always the pointer to the SpmiStatVals structure whose data value is decoded and returned in the value argument.

SpmiPathAddSetStat Subroutine

Purpose

Adds a statistics value to a set of statistics.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h struct SpmiStatVals *SpmiPathAddSetStat(StatSet, StatName, Parent) struct SpmiStatSet *StatSet; char *StatName; SpmiCxHdl Parent;

Description

The SpmiPathAddSetStat subroutine adds a statistics value to a set of statistics. The SpmiStatSet structure that provides the anchor point to the set must exist before the SpmiPathAddSetStat subroutine call can succeed.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

StatSet

Specifies a pointer to a valid structure of type SpmiStatSet as created by the "SpmiCreateStatSet Subroutine" on page 251 call.

StatName

Specifies the name of the statistic within the context identified by the Parent parameter. If the Parent parameter is NULL, you must specify the fully qualified path name of the statistic in the StatName parameter.

Parent

Specifies either a valid SpmiCxHdI handle as obtained by another subroutine call or a NULL value.

Return Values

The SpmiPathAddSetStat subroutine returns a pointer to a structure of type SpmiStatVals if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno;

If the subroutine returns without an error, the SpmiErrno variable is set to 0 and the SpmiErrmsg character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsg variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

SpmiPathGetCx Subroutine

Purpose

Returns a handle to use when referencing a context.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h SpmiCxHdl SpmiPathGetCx(CxPath, Parent) char *CxPath; SpmiCxHdl Parent;

Description

The SpmiPathGetCx subroutine searches the context hierarchy for a given path name of a context and returns a handle to use when subsequently referencing the context.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

CxPath

Specifies the path name of the context to find. If you specify the fully qualified path name in the CxPath parameter, you must set the Parent parameter to NULL. If the path name is not qualified or is only partly qualified (that is, if it does not include the names of all contexts higher in the data hierarchy), the SpmiPathGetCx subroutine begins searching the hierarchy at the context identified by the Parent parameter. If the CxPath parameter is either NULL or an empty string, the subroutine returns a handle identifying the Top context.

Parent

Specifies the anchor context that fully qualifies the CxPath parameter. If you specify a fully qualified path name in the CxPath parameter, you must set the Parent parameter to NULL.

Return Values

The SpmiPathGetCx subroutine returns a handle to a context if successful. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- · extern int SpmiErrno;

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

SpmiStatGetPath Subroutine

Purpose

Returns the full path name of a statistic.

Library

SPMI Library (libSpmi.a)

Syntax

#include sys/Spmidef.h> char *miStatGetPath(Parent, StatHandle, MaxLevels) SpmiCxHdlSp Parent; SpmiStatHdl StatHandle; int MaxLevels;

Description

The **SpmiStatGetPath** subroutine returns the full path name of a statistic, given a parent context SpmiCxHdI handle and a statistics SpmiStatHdI handle. The MaxLevels parameter can limit the number of levels in the hierarchy that must be searched to generate the path name of the statistic.

The memory area pointed to by the returned pointer is freed when the **SpmiStatGetPath** subroutine call is repeated. For each invocation of the subroutine, a new memory area is allocated and its address returned. If the calling program needs the returned character string after issuing the SpmiStatGetPath subroutine call, the program must copy the returned string to locally allocated memory before reissuing the subroutine call.

This subroutine is part of the server option of the Performance Aide for AIX licensed product and is also included in the Performance Toolbox for AIX licensed product.

Parameters

Parent

Specifies a valid SpmiCxHdI handle as obtained by another subroutine call.

StatHandle

Specifies a valid SpmiStatHdI handle as obtained by another subroutine call. This handle must point to a statistic belonging to the context identified by the *Parent* parameter.

MaxLevels

Limits the number of levels in the hierarchy that must be searched to generate the path name. If this parameter is set to 0, no limit is imposed.

Return Values

If successful, the SpmiStatGetPath subroutine returns a pointer to a character array containing the full path name of the statistic. If unsuccessful, the subroutine returns a NULL value.

Error Codes

All SPMI subroutines use external variables to provide error information. To access these variables, an application program must define the following external variables:

- extern char SpmiErrmsg[];
- extern int SpmiErrno:

If the subroutine returns without an error, the **SpmiErrno** variable is set to 0 and the **SpmiErrmsq** character array is empty. If an error is detected, the SpmiErrno variable returns an error code, as defined in the sys/Spmidef.h file, and the SpmiErrmsq variable contains text, in English, explaining the cause of the error. See the List of SPMI Error Codes for more information.

Files

/usr/include/sys/Spmidef.h

sqrt, sqrtf, sqrtl, sqrtd32, sqrtd64, and sqrtd128 Subroutines

Purpose

Computes the square root.

Syntax

```
#include <math.h>
double sqrt ( x)
double x;
float sqrtf (x)
float x;
long double sqrtl (x)
long double x;
_Decimal32 sqrtd32 (x)
_Decimal32 x;
_Decimal64 sqrtd64 (x)
_Decimal64 x;
_Decimal128 sqrtd128 (x)
_Decimal128 x;
```

Description

The **sqrt**, **sqrtf**, **sqrtd32**, **sqrtd64**, and **sqrtd128** subroutines compute the square root of the *x* parameter.

An application wishing to check for error situations should set the **errno** global variable to zero and call **feclearexcept(FE_ALL_EXCEPT)** before calling these subroutines. Upon return, if **errno** is nonzero or **fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)** is nonzero, an error has occurred.

Parameters

x Specifies some double-precision floating-point value.

Return Values

Upon successful completion, the **sqrt**, **sqrtf**, **sqrtI**, **sqrtd32**, **sqrtd64**, and **sqrtd128** subroutines return the square root of *x*.

For finite values of x < -0, a domain error occurs, and a NaN is returned.

If x is NaN, a NaN is returned.

If x is ± 0 or +Inf, x is returned.

If x is -Inf, a domain error shall occur, and a NaN is returned.

Error Codes

When using libm.a (-lm):

For the **sqrt** subroutine, if the value of *x* is negative, a NaNQ is returned and the **errno** global variable is set to a **EDOM** value.

When using libmsaa.a (-lmsaa):

If the value of x is negative, a 0 is returned and the **errno** global variable is set to a **EDOM** value. A message indicating a **DOMAIN** error is printed on the standard error output.

These error-handling procedures may be changed with the matherr subroutine when using the libmsaa.a (-Imsaa) library.

src_err_msg Subroutine

Purpose

Retrieves a System Resource Controller (SRC) error message.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
int src_err_msg ( errno, ErrorText)
int errno;
char **ErrorText;
```

Description

The **src err msq** subroutine retrieves a System Resource Controller (SRC) error message.

Parameters

Specifies the SRC error code. errno

ErrorText Points to a character pointer to place the SRC error message.

Return Values

Upon successful completion, the src_err_msg subroutine returns a value of 0. Otherwise, a value of -1 is returned. No error message is returned.

src_err_msg_r Subroutine

Purpose

Gets the System Resource Controller (SRC) error message corresponding to the specified SRC error code.

Library

System Resource Controller (libsrc.a)

Syntax

```
#include <spc.h>
int src err msg r (srcerrno, ErrorText)
int srcerrno;
char ** ErrorText;
```

Description

The src err msq r subroutine returns the message corresponding to the input srcerrno value in a caller-supplied buffer. This subroutine is threadsafe and reentrant.

Parameters

srcerrno Specifies the SRC error code.

ErrorText Pointer to a variable containing the address of a caller-supplied buffer where the message will be returned. If the length of the message is unknown, the maximum message length can be used

when allocating the buffer. The maximum message length is SRC_BUF_MAX in /usr/include/spc.h

(2048 bytes).

Return Values

Upon successful completion, the src_err_msg_r subroutine returns a value of 0. Otherwise, no error message is returned and the subroutine returns a value of -1.

srcrrqs Subroutine

Purpose

Gets subsystem reply information from the System Resource Controller (SRC) request received.

Library

System Resource Controller Library (libsrc.a)

Syntax

#include <spc.h> struct srchdr *srcrrqs (Packet) char *Packet;

Description

The srcrrqs subroutine saves the srchdr information contained in the packet the subsystem received from the System Resource Controller (SRC). The **srchdr** structure is defined in the **spc.h** file. This routine must be called by the subsystem to complete the reception process of any packet received from the SRC. The subsystem requires this information to reply to any request that the subsystem receives from the SRC.

Note: The saved srchdr information is overwritten each time this subroutine is called.

Parameters

Packet

Points to the SRC request packet received by the subsystem. If the subsystem received the packet on a message queue, the Packet parameter must point past the message type of the packet to the start of the request information. If the subsystem received the information on a socket, the Packet parameter points to the start of the packet received on the socket.

Return Values

The **srcrrqs** subroutine returns a pointer to the static **srchdr** structure, which contains the return address for the subsystem response.

Examples

The following will obtain the subsystem reply information:

```
struct sockaddr addr;
int addrsz;
struct srcreq packet;
/* wait to receive packet from SRC daemon */
rc=recvfrom(0, &packet, sizeof(packet), 0, &addr, &addrsz);
/* grab the reply information from the SRC packet */
if (rc>0)
  srchdr=srcrrqs (&packet);
```

Files

/dev/SRC Specifies the **AF_UNIX** socket file.

/dev/.SRC-unix Specifies the location for temporary socket files.

srcrrqs_r Subroutine

Purpose

Copies the System Resource Controller (SRC) request header to the specified buffer. The SRC request header contains the return address where the caller sends responses for this request.

Library

System Resource Controller (libsrc.a)

Syntax

```
#include <spc.h>
struct srchdr *srcrrqs_r (Packet, SRChdr)
char * Packet;
struct srchdr * SRChdr;
```

Description

The srcrrqs_r subroutine saves the SRC request header (srchdr) information contained in the packet the subsystem received from the Source Resource Controller. The **srchdr** structure is defined in the **spc.h** file. This routine must be called by the subsystem to complete the reception process of any packet received from the SRC. The subsystem requires this information to reply to any request that the subsystem receives from the SRC.

This subroutine is threadsafe and reentrant.

Parameters

Packet Points to the SRC request packet received by the subsystem. If the subsystem received the packet on a

message queue, the Packet parameter must point past the message type of the packet to the start of the request information. If the subsystem received the information on a socket, the Packet parameter points to the start of the packet received on the socket.

Points to a caller-supplied buffer. The srcrrqs_r subroutine copies the request header to this buffer. SRChdr

Examples

The following will obtain the subsystem reply information:

```
int rc:
struct sockaddr addr;
int addrsz;
struct srcreq packet;
struct srchdr *header;
struct srchdr *rtn addr;
/*wait to receive packet from SRC daemon */
rc=recvfrom(0, &packet, sizeof(packet), 0, &addr, &addrsz;
/* grab the reply information from the SRC packet */
if (rc>0)
 header = (struct srchdr *)malloc(sizeof(struct srchdr));
  rtn_addr = srcrrqs_r(&packet,header);
  if (rtn addr == NULL)
    /* handle error */
```

Return Values

Upon successful completion, the **srcrrq** r subroutine returns the address of the caller-supplied buffer.

Error Codes

If either of the input addresses is NULL, the srcrrqs_r subroutine fails and returns a value of NULL.

SRC_PARM One of the input addresses is NULL.

Related Information

The src err msg r ("src err msg r Subroutine" on page 290), srcsbuf r ("srcsbuf r Subroutine" on page 296), srcsrqt r ("srcsrqt r Subroutine" on page 305), srcstat r ("srcstat r Subroutine" on page 311), and **srcstattxt** r ("srcstattxt r Subroutine" on page 315) subroutines.

srcsbuf Subroutine

Purpose

Gets status for a subserver or a subsystem and returns status text to be printed.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
intsrcsbuf(Host, Type, SubsystemName,
SubserverObject, SubsystemPID, StatusType, StatusFrom, StatusText, Continued)
char * Host, * SubsystemName;
char * SubserverObject, ** StatusText;
short Type, StatusType;
int SubsystemPID, StatusFrom, * Continued;
```

Description

The srcsbuf subroutine gets the status of a subserver or subsystem and returns printable text for the status in the address pointed to by the StatusText parameter.

When the StatusType parameter is SHORTSTAT and the Type parameter is SUBSYSTEM, the srcstat subroutine is called to get the status of one or more subsystems. When the StatusType parameter is **LONGSTAT** and the *Type* parameter is **SUBSYSTEM**, the **srcrsqt** subroutine is called to get the long status of one subsystem. When the Type parameter is not SUBSYSTEM, the srcsrqt subroutine is called to get the long or short status of a subserver.

Parameters

Host	Specifies the foreign host on which this status action is requested. If the host is null, the status request is sent to the System Resource Controller (SRC) on the local host. The local user must be running as "root". The remote system must be configured to accept remote System Resource Controller requests. That is, the srcmstr daemon (see /etc/inittab) must be started with the -r flag and the /etc/hosts.equiv or .rhosts file must be configured to allow remote requests.
Туре	Specifies whether the status request applies to the subsystem or subserver. If the <i>Type</i> parameter is set to SUBSYSTEM , the status request is for a subsystem. If not, the status request is for a subserver and the <i>Type</i> parameter is a subserver code point.
SubsystemName	Specifies the name of the subsystem on which to get status. To get the status of all subsystems, use the SRCALLSUBSYS constant. To get the status of a group of subsystems, the <i>SubsystemName</i> parameter must start with the SRCGROUP constant, followed by the name of the group for which you want status appended. If you specify a null <i>SubsystemName</i> parameter, you must specify a <i>SubsystemPID</i> parameter.
SubserverObject	Specifies a subserver object. The <i>SubserverObject</i> parameter modifies the <i>Type</i> parameter. The <i>SubserverObject</i> parameter is ignored if the <i>Type</i> parameter is set to SUBSYSTEM . The use of the <i>SubserverObject</i> parameter is determined by the subsystem and the caller. This parameter will be placed in the objname field of the subreq structure that is passed to the subsystem.
SubsystemPID	Specifies the process ID of the subsystem on which to get status, as returned by the srcstrt subroutine. You must specify the <i>SubsystemPID</i> parameter if multiple instances of the subsystem are active and you request a long subsystem status or subserver status. If you specify a null <i>SubsystemPID</i> parameter, you must specify a <i>SubsystemName</i> parameter.

Specifies LONGSTAT for long status or SHORTSTAT for short status.

Specifies whether status errors and messages are to be printed to standard output or just returned to the caller. When the StatusFrom parameter is SSHELL, the errors are

StatusType

StatusFrom

printed to standard output.

StatusText Allocates memory for the printable text and sets the StatusText parameter to point to

this memory. After it prints the text, the calling process must free the memory allocated

for this buffer.

Continued Specifies whether this call to the srcsbuf subroutine is a continuation of a status

request. If the Continued parameter is set to NEWREQUEST, a request for status is sent and the srcsbuf subroutine then waits for another. On return, the srcsbuf subroutine is updated to the new continuation indicator from the reply packet and the Continued parameter is set to END or STATCONTINUED by the subsystem. If the Continued parameter is set to something other than END, this field must remain equal to that value; otherwise, this function will not be able to receive any more packets for the original status request. The calling process should not set the value of the Continued parameter to a value other than NEWREQUEST. The Continued parameter

should not be changed while more responses are expected.

Return Values

If the srcsbuf subroutine succeeds, it returns the size (in bytes) of printable text pointed to by the StatusText parameter.

Error Codes

The **srcsbuf** subroutine fails if one or more of the following are true:

SRC_BADSOCK The request could not be passed to the subsystem because of some

socket failure.

SRC CONT The subsystem uses signals. The request cannot complete.

SRC_DMNA The SRC daemon is not active.

SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC_INVALID_USER The user is not root or group system.

SRC_MMRY An SRC component could not allocate the memory it needs.

SRC_NOCONTINUE The Continued parameter was not set to NEWREQUEST, and no

continuation is currently active.

SRC NORPLY The request timed out waiting for a response.

SRC_NSVR The subsystem is not active.

SRC SOCK There is a problem with SRC socket communications.

SRC_STPG The request was not passed to the subsystem. The subsystem is

stopping.

SRC_UDP The SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known.

SRC_WICH There are multiple instances of the subsystem active.

Examples

1. To get the status of a subsystem, enter:

```
char *status;
int continued=NEWREQUEST;
int rc;
do {
  rc=srcsbuf("MaryC", SUBSYSTEM, "srctest", "", 0,
     SHORTSTAT, SSHELL, &status, continued);
   if (status!=0)
    {
        printf(status);
        free(status);
        status=0;
} while (rc>0);
```

This gets short status of the srctest subsystem on the MaryC machine and prints the formatted status to standard output.

2. To get the status of a subserver, enter:

```
char *status;
int continued=NEWREQUEST;
int rc;
  rc=srcsbuf("", 12345, "srctest", "", 0,
     LONGSTAT, SSHELL, &status, continued);
   if (status!=0)
        printf(status);
        free(status);
        status=0;
} while (rc>0);
```

This gets long status for a specific subserver belonging to subsystem srctest. The subserver is the one having code point 12345. This request is processed on the local machine. The formatted status is printed to standard output.

Files

/etc/services Defines sockets and protocols used for Internet services.

/dev/SRC Specifies the AF_UNIX socket file.

/dev/.SRC-unix Specifies the location for temporary socket files.

srcsbuf_r Subroutine

Purpose

Gets status for a subserver or a subsystem and returns status text to be printed.

Library

System Resource Controller Library (libsrc.a)

Syntax

#include <spc.h>

```
int srcsbuf_r(Host, Type, SubsystemName, SubserverObject, SubsystemPID,
StatusType, StatusFrom, StatusText, Continued, SRCHandle)
char * Host, * SubsystemName;
char * SubserverObject, ** StatusText;
short Type, StatusType;
pid t SubsystemPID;
int StatusFrom * Continued;
char ** SRCHandle;
```

Description

The srcsbuf_r subroutine gets the status of a subserver or subsystem and returns printable text for the status in the address pointed to by the StatusText parameter. The srcsbuf_r subroutine supports all the functions of the **srcbuf** subroutine except the *StatusFrom* parameter.

When the StatusType parameter is SHORTSTAT and the Type parameter is SUBSYSTEM, the srcstat r subroutine is called to get the status of one or more subsystems. When the StatusType parameter is LONGSTAT and the Type parameter is SUBSYSTEM, the srcrsqt_r subroutine is called to get the long status of one subsystem. When the Type parameter is not SUBSYSTEM, the srcsrqt_r subroutine is called to get the long or short status of a subserver.

This routine is threadsafe and reentrant.

Parameters

Host	Specifies the foreign host on which this status action is requested. If the host is null, the status request is sent to the System Resource Controller (SRC) on the local host.
Туре	Specifies whether the status request applies to the subsystem or subserver. If the <i>Type</i> parameter is set to SUBSYSTEM , the status request is for a subsystem. If not, the status request is for a subserver and the <i>Type</i> parameter is a subserver code point.
SubsystemName	Specifies the name of the subsystem on which to get status. To get the status of all subsystems, use the SRCALLSUBSYS constant. To get the status of a group of subsystems, the <i>SubsystemName</i> parameter must start with the SRCGROUP constant, followed by the name of the group for which you want status appended. If you specify a null <i>SubsystemName</i> parameter, you must specify a <i>SubsystemPID</i> parameter.
SubserverObject	Specifies a subserver object. The <i>SubserverObject</i> parameter modifies the <i>Type</i> parameter. The <i>SubserverObject</i> parameter is ignored if the <i>Type</i> parameter is set to SUBSYSTEM . The use of the <i>SubserverObject</i> parameter is determined by the subsystem and the caller. This parameter will be placed in the objname field of the subreq structure that is passed to the subsystem.
SubsystemPID	Specifies the process ID of the subsystem on which to get status, as returned by the srcstrt subroutine. You must specify the <i>SubsystemPID</i> parameter if multiple instances of the subsystem are active and you request a long subsystem status or subserver status. If you specify a null <i>SubsystemPID</i> parameter, you must specify a <i>SubsystemName</i> parameter.
StatusType	Specifies LONGSTAT for long status or SHORTSTAT for short status.
StatusFrom	Specifies whether status errors and messages are to be printed to standard output or just returned to the caller. When the <i>StatusFrom</i> parameter is SSHELL , the errors are printed to standard output. The SSHELL value is not recommended in a multithreaded environment since error messages to standard output may be interleaved in an unexpected manner.
StatusText	Allocates memory for the printable text and sets the <i>StatusText</i> parameter to point to this memory. After it prints the text, the calling process must free the memory allocated for this buffer.

Continued

Specifies whether this call to the **srcsbuf_r** subroutine is a continuation of a status request. If the Continued parameter is set to NEWREQUEST, a request for status is sent and the srcsbuf_r subroutine then waits for a reply. On return from the srcsbuf_r subroutine, the Continued parameter is updated to the new continuation indicator from the reply packet. The continuation indicator in the reply packet will be set to END or **STATCONTINUED** by the subsystem. If the *Continued* parameter is set to something other than END, the caller should not change that value; otherwise, this function will not be able to receive any more packets for the original status request. The calling process

should not set the value of the Continued parameter to a value other than **NEWREQUEST**. In normal processing, the *Continued* parameter should not be changed while more responses are expected. The caller must continue to call the srcsbuf_r subroutine until END is received. As an alternative, call the srcsbuf_r subroutine with Continued=SRC_CLOSE to discard the remaining data, close the

socket, and free the internal buffers.

SRCHandle

Identifies a request and its associated responses. Set to NULL by the caller for a NEWREQUEST. The srcsbuf_r subroutine saves a value in SRCHandle to allow srcsbuf_r continuation calls to use the same socket and internal buffers. The SRCHandle parameter should not be changed by the caller except for

NEWREQUESTs.

Return Values

If the srcsbuf_r subroutine succeeds, it returns the size (in bytes) of printable text pointed to by the StatusText parameter.

Error Codes

The srcsbuf_r subroutine fails and returns the corresponding error code if one of the following error conditions is detected:

SRC BADSOCK The request could not be passed to the subsystem because of some

socket failure.

SRC_CONT The subsystem uses signals. The request cannot complete.

SRC DMNA The SRC daemon is not active.

SRC INET AUTHORIZED HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC_INVALID_USER The user is not root or group system.

SRC MMRY An SRC component could not allocate the memory it needs. SRC_NOCONTINUE The *Continued* parameter was not set to **NEWREQUEST**, and no

continuation is currently active.

The request timed out waiting for a response. SRC_NORPLY

SRC NSVR The subsystem is not active.

SRC_SOCK There is a problem with SRC socket communications.

SRC STPG The request was not passed to the subsystem. The subsystem is

stopping.

SRC UDP The SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known.

SRC_WICH There are multiple instances of the subsystem active.

Examples

1. To get the status of a subsystem, enter:

```
char *status;
int continued=NEWREQUEST;
int rc:
char *handle
do {
```

```
rc=srcsbuf_r("MaryC", SUBSYSTEM, "srctest", "", 0,
     SHORTSTAT, SDAEMON, &status, continued, &handle);
   if (status!=0)
        printf(status);
        free(status);
        status=0;
  while (rc>0);
if (rc<0)
   ...handle error from srcsbuf r...
```

This gets short status of the srctest subsystem on the MaryC machine and prints the formatted status to standard output.

Caution: In a multithreaded environment, the caller must manage the sharing of standard output between threads. Set the StatusFrom parameter to SDAEMON to prevent unexpected error messages from being printed to standard output.

2. To get the status of a subserver, enter:

```
char *status;
int continued=NEWREQUEST;
int rc;
char *handle
  rc=srcsbuf_r("", 12345, "srctest", "", 0,
     LONGSTAT, SDAEMON, &status, continued, &handle);
   if (status!=0)
    {
        printf(status);
        free(status);
        status=0;
} while (rc>0);
if (rc<0)
   ...handle error from srcsbuf r...
```

This gets long status for a specific subserver belonging to subsystem srctest. The subserver is the one having code point 12345. This request is processed on the local machine. The formatted status is printed to standard output.

CAUTION:

In a multithreaded environment, the caller must manage the sharing of standard output between threads. Set the StatusFrom parameter to SDAEMON to prevent unexpected error messages from being printed to standard output.

System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcsrpy Subroutine

Purpose

Sends a reply to a request from the System Resource Controller (SRC) back to the client process.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
int srcsrpy ( SRChdr, PPacket, PPacketSize, Continued)
struct srchdr *SRChdr:
char *PPacket;
int PPacketSize;
ushort Continued;
```

Description

The srcsrpy subroutine returns a subsystem reply to a System Resource Controller (SRC) subsystem request. The format and content of the reply are determined by the subsystem and the requester, but must start with a **srchdr** structure. This structure and all others required for subsystem communication with the SRC are defined in the /usr/include/spc.h file. The subsystem must reply with a pre-defined format and content for the following requests: START, STOP, STATUS, REFRESH, and TRACE. The START, STOP, REFRESH, and TRACE requests must be answered with a srcrep structure. The STATUS request must be answered with a reply in the form of a **statbuf** structure.

Note: The srcsrpy subroutine creates its own socket to send the subsystem reply packets.

Parameters

SRChdr Points to the reply address buffer as returned by the **srcrrqs** subroutine.

PPacket Points to the reply packet. The first element of the reply packet is a **srchdr** structure. The cont

> element of the *PPacket->srchdr* structure is modified on returning from the *srcsrpy* subroutine. The second element of the reply packet should be a svrreply structure, an array of statcode structures, or another format upon which the subsystem and the requester have agreed.

PPacketSize Specifies the number of bytes in the reply packet pointed to by the PPacket parameter. The

PPacketSize parameter may be the size of a short, or it may be between the size of a srchdr

structure and the SRCPKTMAX value, which is defined in the spc.h file.

Continued

Indicates whether this reply is to be continued. If the *Continued* parameter is set to the constant **END**, no more reply packets are sent for this request. If the *Continued* parameter is set to **CONTINUED**, the second element of what is indicated by the *PPacket* parameter must be a **svrreply** structure, since the rtnmsg element of the **svrreply** structure is printed to standard output. For a status reply, the *Continued* parameter is set to **STATCONTINUED**, and the second element of what is pointed to by the *PPacket* parameter must be an array of **statcode** structures. If a STOP subsystem request is received, only one reply packet can be sent and the *Continued* parameter must be set to **END**. Other types of continuations, as determined by the subsystem and the requester, must be defined using positive values for the *Continued* parameter. Values other than the following must be used:

- 0 END
- 1 CONTINUED
- 2 STATCONTINUED

Return Values

If the srcsrpy subroutine succeeds, it returns the value SRC_OK.

Error Codes

The **srcsrpy** subroutine fails if one or both of the following are true:

SRC_SOCK There is a problem with SRC socket communications.

SRC_REPLYSZ SRC reply size is invalid.

Examples

1. To send a STOP subsystem reply, enter:

```
struct srcrep return_packet;
struct srchdr *srchdr;

bzero(&return_packet,sizeof(return_packet));
return_packet.svrreply.rtncode=SRC_OK;
strcpy(return_packet.svrreply, "srctest");
srcsrpy(srchdr,return_packet,sizeof(return_packet),END);
```

This entry sends a message that the subsystem spctest is stopping successfully.

2. To send a **START** subserver reply, enter:

```
struct srcrep return_packet;
struct srchdr *srchdr;

bzero(&return_packet,sizeof(return_packet));
return_packet.svrreply.rtncode=SRC_SUBMSG;
strcpy(return_packet.svrreply,objname, "mysubserver");
strcpy(return_packet.svrreply,objtext, "The subserver,\
mysubserver, has been started");
srcsrpy(srchdr,return packet,sizeof(return packet),END);
```

The resulting message indicates that the start subserver request was successful.

3. To send a status reply, enter:

```
int rc;
struct sockaddr addr;
int addrsz;
struct srcreq packet;
struct
{
    struct srchdr srchdr;
    struct statcode statcode[10];
```

```
} status:
struct srchdr *srchdr;
struct srcreq packet;
/* grab the reply information from the SRC packet */
srchdr=srcrrqs(&packet);
bzero(&status.statcode[0].objname,
/* get SRC status header */
srcstathdr(status.statcode[0].objname,
  status.statcode[0].objtext);
/* send status packet(s) */
srcsrpy(srchdr,&status,sizeof(status),STATCONTINUED);
srcsrpy(srchdr,&status,sizeof(status),STATCONTINUED);
/* send final packet */
srcsrpy(srchdr,&status,sizeof(struct srchdr),END);
This entry sends several status packets.
```

srcsrqt Subroutine

Purpose

Sends a request to a subsystem.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h> srcsrqt(Host, SubsystemName, SubsystemPID,
RequestLength, SubsystemRequest, ReplyLength, ReplyBuffer, StartItAlso, Continued)
char * Host, * SubsystemName;
char * SubsystemRequest, * ReplyBuffer;
int SubsystemPID, StartItAlso, * Continued;
short RequestLength, * ReplyLength;
```

Description

The **srcsrqt** subroutine sends a request to a subsystem, waits for a response, and returns one or more replies to the caller. The format of the request and the reply is determined by the caller and the subsystem.

Note: The **srcsrqt** subroutine creates its own socket to send a request to the subsystem. The socket that this function opens remains open until an error or an end packet is received.

Two types of continuation are returned by the **srcsrqt** subroutine:

No continuation ReplyBuffer->srchdr.continued is set to the **END** constant.

Reply continuation ReplyBuffer->srchdr.continued is not set to the END constant, but to a positive

value agreed upon by the calling process and the subsystem. The packet is

returned to the caller.

Parameters

SubsystemPID The process ID of the subsystem.

Host Specifies the foreign host on which this subsystem request is to be sent. If the host is

null, the request is sent to the subsystem on the local host. The local user must be running as "root". The remote system must be configured to accept remote System Resource Controller requests. That is, the **srcmstr** daemon (see /etc/inittab) must be started with the -r flag and the /etc/hosts.equiv or .rhosts file must be configured to

allow remote requests.

SubsystemName Specifies the name of the subsystem to which this request is to be sent. You must

specify a SubsystemName if you do not specify a SubsystemPID.

RequestLength Specifies the length, in bytes, of the request to be sent to the subsystem. The

maximum value in bytes for this parameter is 2000 bytes.

SubsystemRequest Points to the subsystem request packet.

ReplyLength Specifies the maximum length, in bytes, of the reply to be received from the

subsystem. On return from the srcsrqt subroutine, the ReplyLength parameter is set

to the actual length of the subsystem reply packet.

ReplyBuffer Points to a buffer for the receipt of the reply packet from the subsystem.

StartItAlso Specifies whether the subsystem should be started if it is nonactive. When nonzero,

the System Resource Controller (SRC) attempts to start a nonactive subsystem, and

then passes the request to the subsystem.

Continued Specifies whether this call to the **srcsrqt** subroutine is a continuation of a previous

request. If the *Continued* parameter is set to **NEWREQUEST**, a request for it is sent to the subsystem and the subsystem is notified that another response is expected.

The calling process should never set Continued to any value other than

NEWREQUEST. The last response from the subsystem will set *Continued* to **END**.

Return Values

If the **srcsrqt** subroutine is successful, the value **SRC_OK** is returned.

Error Codes

The **srcsrqt** subroutine fails if one or more of the following are true:

SRC_BADSOCK The request could not be passed to the subsystem because of a

socket failure.

SRC_CONT The subsystem uses signals. The request cannot complete.

SRC_DMNA The SRC daemon is not active.

SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC_INVALID_USERThe user is not root or group system.

SRC_MMRY

An SRC component could not allocate the memory it needs.

SRC_NOCONTINUE

The Continued parameter was not set to NEWREQUEST, and no

continuation is currently active.

SRC_NORPLY The request timed out waiting for a response.

SRC_NSVR The subsystem is not active.

SRC_REQLEN2BIG The RequestLength is greater than the maximum 2000 bytes.

SRC_SOCK There is a problem with SRC socket communications.

SRC_STPG The request was not passed to the subsystem. The subsystem is

stopping.

SRC_UDP The SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known.

Examples

1. To request long subsystem status, enter:

```
int cont=NEWREQUEST;
int rc;
short replen;
short reglen;
struct
    struct srchdr srchdr;
    struct statcode statcode[20];
} statbuf;
struct subreq subreq;
subreq.action=STATUS;
subreq.object=SUBSYSTEM;
subreq.parm1=LONGSTAT;
strcpy(subreq.objname, "srctest");
replen=sizeof(statbuf);
reqlen=sizeof(subreq);
rc=srcsrqt("MaryC", "srctest", 0, reqlen, &subreq, &replen,
&statbuf, SRC NO, &cont);
```

This entry gets long status of the subsystem srctest on the MaryC machine. The subsystem keeps sending status packets until statbuf.srchdr.cont=END.

2. To start a subserver, enter:

```
int cont=NEWREQUEST;
int rc;
short replen;
short reqlen;
struct
{
    struct srchdr srchdr;
    struct statcode statcode[20];
} statbuf;
```

```
struct subreq subreq;
subreq.action=START;
subreq.object=1234;
replen=sizeof(statbuf);
reqlen=sizeof(subreq);
rc=srcsrqt("", "", 987, reqlen, &subreq, &replen, &statbuf,
SRC NO, &cont);
```

This entry starts the subserver with the code point of 1234, but only if the subsystem is already active.

3. To start a subserver and a subsystem, enter:

```
int cont=NEWREQUEST;
int rc;
short replen;
short reqlen;
struct
{
    struct srchdr srchdr;
    struct statcode statcode[20];
} stabuf;
struct subreq subreq;
subreq.action=START;
subreq.object=1234;
replen=sizeof(statbuf);
reqlen=sizeof(subreq);
rc=srcsrqt("", "", 987, reqlen, &subreq, &replen, &statbuf, SRC YES, &cont);
```

This entry starts the subserver with the code point of 1234. If the subsystem to which this subserver belongs is not active, the subsystem is started.

Files

/etc/services Defines sockets and protocols used for Internet services.

/dev/SRC Specifies the AF UNIX socket file.

/dev/.SRC-unix Specifies the location for temporary socket files.

Related Information

The **srcrrqs** ("srcrrqs Subroutine" on page 291) subroutine, **srcsbuf** ("srcsbuf Subroutine" on page 293) subroutine, **srcsrpy** ("srcsrpy Subroutine" on page 300) subroutine, **srcstat** ("srcstat Subroutine" on page 309) subroutine, **srcstathdr** ("srcstathdr Subroutine" on page 313) subroutine, **srcstattxt** ("srcstattxt Subroutine" on page 314) subroutine, **srcstop** ("srcstop Subroutine" on page 316) subroutine, **srcstrt** ("srcstrt Subroutine" on page 318) subroutine.

List of SRC Subroutines, Programming Subsystem Communication with the SRC, System Resource Controller (SRC) Overview for Programmers in *AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.*

srcsrqt_r Subroutine

Purpose

Sends a request to a subsystem.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
srcsrqt r(Host, SubsystemName, SubsystemPID, RequestLength,
```

SubsystemRequest, ReplyLength, ReplyBuffer, StartItAlso,

Continued, SRCHandle)

char * Host, * SubsystemName;

char * SubsystemRequest, * ReplyBuffer;

pid t SubsystemPID,

int, StartItAlso, * Continued; short RequestLength, * ReplyLength;

char ** SRCHandle;

Description

The srcsrqt_r subroutine sends a request to a subsystem, waits for a response and returns one or more replies to the caller. The format of the request and the reply is determined by the caller and the subsystem.

Note: For each NEWREQUEST, the srcsrqt_r subroutine creates its own socket to send a request to the subsystem. The socket that this function opens remains open until an error or an end packet is received.

This system is threadsafe and reentrant.

Two types of continuation are returned by the **srcsrqt_r** subroutine:

No continuation ReplyBuffer->srchdr.continued is set to the END constant.

Reply continuation ReplyBuffer->srchdr.continued is not set to the END constant, but to a positive

value agreed upon by the calling process and the subsystem. The packet is

returned to the caller.

Parameters

SubsystemPID The process ID of the subsystem.

Specifies the foreign host on which this subsystem request is to be sent. If the Host

host is null, the request is sent to the subsystem on the local host.

SubsystemName Specifies the name of the subsystem to which this request is to be sent. You

must specify a SubsystemName if you do not specify a SubsystemPID.

RequestLength Specifies the length, in bytes, of the request to be sent to the subsystem. The

maximum length is 2000 bytes.

SubsystemRequest Points to the subsystem request packet.

Specifies the maximum length, in bytes, of the reply to be received from the ReplyLength

subsystem. On return from the **srcsrqt** subroutine, the *ReplyLength* parameter is

set to the actual length of the subsystem reply packet.

ReplyBuffer Points to a buffer for the receipt of the reply packet from the subsystem. StartItAlso Specifies whether the subsystem should be started if it is nonactive. When

nonzero, the System Resource Controller (SRC) attempts to start a nonactive

subsystem, and then passes the request to the subsystem.

Continued Specifies whether this call to the **srcsrqt** subroutine is a continuation of a

previous request. If the *Continued* parameter is set to **NEWREQUEST**, a request for it is sent to the subsystem and the subsystem is notified that a response is expected. Under normal circumstances, the calling process should never set *Continued* to any value other than **NEWREQUEST**. The last response from the subsystem will set *Continued* to **END**. The caller must continue to call the **srcsrqt_r** subroutine until **END** is received. Otherwise, the socket will not be

closed and the internal buffers freed. As an alternative, set

Continued=SRC_CLOSE to discard the remaining data, close the socket, and

free the internal buffers.

SRCHandle Identifies a request and its associated responses. Set to NULL by the caller for a

NEWREQUEST. The **srcsrqt_r** subroutine saves a value in *SRCHandle* to allow **srcsrqt_r** continuation calls to use the same socket and internal buffers. The *SRCHandle* parameter should not be changed by the caller except for

NEWREQUESTs.

Return Values

If the **srcsrqt_r** subroutine is successful, the value **SRC_OK** is returned.

Error Codes

The **srcsrqt_r** subroutine fails and returns the corresponding error code if one of the following error conditions is detected:

SRC_BADSOCK The request could not be passed to the subsystem because of a

socket failure.

SRC_CONTThe subsystem uses signals. The request cannot complete.

SRC_DMNA The SRC daemon is not active.

SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC_INVALID_USER The user is not root or group system.

SRC_MMRY An SRC component could not allocate the memory it needs.

SRC_NOCONTINUE The Continued parameter was not set to NEWREQUEST, and no

continuation is currently active.

SRC NORPLY The request timed out waiting for a response.

SRC_NSVR The subsystem is not active.

SRC_REQLEN2BIG The RequestLength is greater than the maximum 2000 bytes.

SRC_SOCK There is a problem with SRC socket communications.

SRC_STPG The request was not passed to the subsystem. The subsystem is

stopping.

SRC_UDP The SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known.

Examples

1. To request long subsystem status, enter:

```
int cont=NEWREQUEST;
int rc;
short replen;
short reqlen;
char *handle;
struct
{
    struct srchdr srchdr;
    struct statcode statcode[20];
} statbuf;
struct subreq subreq;
```

```
subreq.action=STATUS;
subreq.object=SUBSYSTEM;
subreq.parm1=LONGSTAT;
strcpy(subreq.objname,"srctest");
replen=sizeof(statbuf);
reqlen=sizeof(subreq);
rc=srcsrqt_r("MaryC", "srctest", 0, reqlen, &subreq, &replen,
&statbuf, SRC NO, &cont, &handle);
```

This entry gets long status of the subsystem srctest on the MaryC machine. The subsystem keeps sending status packets until statbuf.srchdr.cont=END.

2. To start a subserver, enter:

```
int cont=NEWREQUEST;
int rc;
short replen;
short reglen;
struct
char *handle;
struct
    struct srchdr srchdr;
    struct statcode statcode[20];
} statbuf;
struct subreq subreq;
subreq.action=START;
subreq.object=1234;
replen=sizeof(statbuf);
reqlen=sizeof(subreq);
rc=srcsrqt_r("", "", 987, reqlen, &subreq, &replen, &statbuf,
SRC NO, &cont, &handle);
```

This entry starts the subserver with the code point of 1234, but only if the subsystem is already active.

3. To start a subserver and a subsystem, enter:

```
int cont=NEWREQUEST;
int rc;
short replen;
short reglen;
char *handle;
struct
    struct srchdr srchdr;
    struct statcode statcode[20];
} statbuf;
struct subreq subreq;
subreq.action=START;
subreq.object=1234;
replen=sizeof(statbuf);
reglen=sizeof(subreg);
rc=srcsrqt("", "", 987, reglen, &subreq, &replen, &statbuf, SRC YES, &cont, &handle);
```

This entry starts the subserver with the code point of 1234. If the subsystem to which this subserver belongs is not active, the subsystem is started.

Files

System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcstat Subroutine

Purpose

Gets short status on one or more subsystems.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
int srcstat(Host,
SubsystemName, SubsystemPID, ReplyLength, StatusReply, Continued)
char * Host, * SubsystemName;
int SubsystemPID, * Continued;
short * ReplyLength;
void * StatusReply;
```

Description

The srcstat subroutine sends a short status request to the System Resource Controller (SRC) and returns status for one or more subsystems to the caller.

Parameters

Host	Specifies the foreign host on which this status action is requested. If the host is null, the status request is sent to the SRC on the local host. The local user must be running as "root". The remote system must be configured to accept remote System Resource Controller requests. That is, the srcmstr daemon (see /etc/inittab) must be started with the -r flag and the /etc/hosts.equiv or .rhosts file must be configured to allow remote requests.
SubsystemName	Specifies the name of the subsystem on which to get short status. To get status of all subsystems, use the SRCALLSUBSYS constant. To get status of a group of subsystems, the <i>SubsystemName</i> parameter must start with the SRCGROUP constant, followed by the name of the group for which you want status appended. If you specify a null <i>SubsystemName</i> parameter, you must specify a <i>SubsystemPID</i> parameter.
SubsystemPID	Specifies the PID of the subsystem on which to get status as returned by the srcstat subroutine. You must specify the <i>SubsystemPID</i> parameter if multiple instances of the subsystem are active and you request a long subsystem status or subserver status. If you specify a null <i>SubsystemPID</i> parameter, you must specify a <i>SubsystemName</i> parameter.

ReplyLength Specifies size of a srchdr structure plus the number of statcode structures times the size

of one **statcode** structure. On return from the **srcstat** subroutine, this value is updated.

StatusReply Specifies a pointer to a structure containing first element as struct srchdr and secondary

element as struct statcode (both defined in spc.h file) array that receives the status reply for the requested subsystem. The first element of the returned statcode array contains the status title line. The number of statcode structures array items depends on the number of

subsystems user queried.

Continued Specifies whether this call to the **srcstat** subroutine is a continuation of a previous status

> request. If the Continued parameter is set to NEWREQUEST, a request for short subsystem status is sent to the SRC and srcstat waits for the first status response. The calling process should never set *Continued* to a value other than **NEWREQUEST**. The last

response for the SRC sets *Continued* to **END**.

Return Values

If the srcstat subroutine succeeds, it returns a value of 0. An error code is returned if the subroutine is unsuccessful.

Error Codes

The **srcstat** subroutine fails if one or more of the following are true:

SRC DMNA The SRC daemon is not active.

SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC INVALID USER The user is not root or group system.

SRC_MMRY An SRC component could not allocate the memory it needs. SRC_NOCONTINUE Continued was not set to NEWREQUEST and no continuation is

currently active.

SRC NORPLY The request timed out waiting for a response.

SRC_SOCK There is a problem with SRC socket communications. SRC UDP The SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known.

Examples

1. To request the status of a subsystem, enter:

```
intcont=NEWREOUEST:
struct {
           struct srchdr srchdr
           struct statcode statcode[6];
} status;
short replen=sizeof(status);
srcstat("MaryC", "srctest", 0, &replen, &status, &cont);
```

This entry requests short status of all instances of the subsystem srctest on the MaryC machine.

2. To request the status of all subsystems, enter:

```
int cont=NEWREQUEST;
struct {
    struct srchdr srchdr;
    struct statcode statcode[80];
} status;
short replen=sizeof(status);
srcstat("",SRCALLSUBSYS,0,&replen,&status,&cont);
```

This entry requests short status of all subsystems on the local machine.

3. To request the status for a group of subsystems, enter:

```
int cont=NEWREOUEST:
struct struct {
    struct srchdr srchdr;
struct statcode statcode[30];
} status:
short replen=sizeof(status), rep num;
char subsysname[30];
strcpy(subsysname, SRCGROUP);
strcat(subsysname, "tcpip");
srcstat("",subsysname,0,&replen,&status, &cont);
rep num = (replen - sizeof(strcut srchdr)) / sizeof(strcut statcode);
for (i = 0; i < rep num; i++)
    printf("objtype %d status %d objname %s objtext %s\n",
            status.statcode[i].objtype, status.statcode[i].status,
            status.statcode[i].objname, status.statcode[i].objtext);
```

This entry requests short status of all members of the subsystem group tcpip on the local machine, and displays the query results on stdout.

Files

/etc/services Defines the sockets and protocols used for Internet services.

/dev/SRC Specifies the AF_UNIX socket file.

List of SRC Subroutines, Programming Subsystem Communication with the SRC, System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcstat r Subroutine

Purpose

Gets short status on a subsystem.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
int srcstat r(Host, SubsystemName, SubsystemPID, ReplyLength,
                 StatusReply, Continued, SRCHandle)
char * Host, * SubsystemName;
pid_t SubsystemPID;
int * Continued;
```

short * ReplyLength; struct statrep * StatusReply; char ** SRCHandle;

Description

The srcstat_r subroutine sends a short status request to the System Resource Controller (SRC) and returns status for one or more subsystems to the caller. This subroutine is threadsafe and reentrant.

Parameters

StatusReply

Continued

Host Specifies the foreign host on which this status action is requested. If the host is null, the

status request is sent to the SRC on the local host.

Specifies the name of the subsystem on which to get short status. To get status of all SubsystemName

> subsystems, use the SRCALLSUBSYS constant. To get status of a group of subsystems, the SubsystemName parameter must start with the SRCGROUP constant, followed by the

name of the group for which you want status appended. If you specify a null SubsystemName parameter, you must specify a SubsystemPID parameter.

Specifies the PID of the subsystem on which to get status as returned by the srcstat_r SubsystemPID

> subroutine. You must specify the SubsystemPID parameter if multiple instances of the subsystem are active and you request a long subsystem status or subserver status. If you specify a null SubsystemPID parameter, you must specify a SubsystemName parameter. Specifies size of a srchdr structure plus the number of statcode structures times the size

ReplyLength of one statcode structure. On return from the srcstat_r subroutine, this value is updated.

> Specifies a pointer to a statrep code structure containing a statcode array that receives the status reply for the requested subsystem. The first element of the returned statcode array contains the status title line. The statcode structure is defined in the spc.h file.

Specifies whether this call to the **srcstat** r subroutine is a continuation of a previous status

request. If the Continued parameter is set to NEWREQUEST, a request for short subsystem status is sent to the SRC and srcstat_r waits for the first status response.

During **NEWREQUEST** processing, the **srcstat r** subroutine opens a socket, mallocs internal buffers, and saves a value in SRCHandle. In normal circumstances, the calling process should never set Continued to a value other than NEWREQUEST. When the srcstat_r subroutine returns with Continued=STATCONTINUED, call srcstat_r without changing the Continued and SRCHandle parameters to receive additional data. The last response from the SRC sets Continued to END. The caller must continue to call srcstat_r until END is received. Otherwise, the socket will not be closed and the internal buffers freed. As an alternative, call srcstat r with Continued=STATCONTINUED to discard the

remaining data, close the socket, and free the internal buffers.

SRCHandle Identifies a request and its associated responses. Set to NULL by the caller for a

> **NEWREQUEST.** The **srcstat_r** subroutine saves a value in *SRCHandle* to allow subsequent srcstat r calls to use the same socket and internal buffers. The SRCHandle

parameter should not be changed by the caller except for **NEWREQUEST**s.

Return Values

If the srcstat_r subroutine succeeds, it returns a value of 0. An error code is returned if the subroutine is unsuccessful.

Error Codes

The srcstat_r subroutine fails and returns the corresponding error code if one of the following error conditions is detected:

The SRC daemon is not active. SRC_DMNA

SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC INVALID USER The user is not root or group system.

SRC MMRY An SRC component could not allocate the memory it needs. SRC_NOCONTINUE Continued was not set to **NEWREQUEST** and no continuation is

currently active.

SRC_NORPLY The request timed out waiting for a response.

SRC SOCK There is a problem with SRC socket communications. SRC UDP The SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known.

Examples

1. To request the status of a subsystem, enter:

```
int cont=NEWREQUEST;
struct statcode statcode[20];
short replen=sizeof(statcode);
char *handle;
srcstat r("MaryC", "srctest", 0, &replen, statcode, &cont, &handle);
```

This entry requests short status of all instances of the subsystem srctest on the MaryC machine.

2. To request the status of all subsystems, enter:

```
int cont=NEWREQUEST;
struct statcode statcode[20];
short replen=sizeof(statcode);
char *handle;
srcstat r("",SRCALLSUBSYS,0,&replen,statcode, &cont, &handle);
```

This entry requests short status of all subsystems on the local machine.

3. To request the status for a group of subsystems, enter:

```
int cont=NEWREQUEST;
struct statcode statcode[20];
short replen=sizeof(statcode);
char subsysname[30];
char *handle;
strcpy(subsysname, SRCGROUP);
strcat(subsysname, "tcpip");
srcstat_r("",subsysname,0,&replen,statcode, &cont, &handle);
```

This entry requests short status of all members of the subsystem group tcpip on the local machine.

Files

/etc/services Defines the sockets and protocols used for Internet services.

/dev/SRC Specifies the AF_UNIX socket file.

/dev/.SRC-unix Specifies the location for temporary socket files.

srcstathdr Subroutine

Purpose

Gets the title line of the System Resource Controller (SRC) status text.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
void srcstathdr ( Title1, Title2)
char *Title1, *Title2;
```

Description

The srcstathdr subroutine retrieves the title line, or header, of the SRC status text.

Parameters

Title1 Specifies the objname field of a **statcode** structure. The subsystem name title is placed here. Title2 Specifies the objtext field of a statcode structure. The remaining titles are placed here.

Return Values

The subsystem name title is returned in the *Title1* parameter. The remaining titles are returned in the *Title2* parameter.

Related Information

The srcrrqs ("srcrrqs Subroutine" on page 291) subroutine, srcsbuf ("srcsbuf Subroutine" on page 293) subroutine, **srcsrpy** ("srcsrpy Subroutine" on page 300) subroutine, **srcsrqt** ("srcsrqt Subroutine" on page 302) subroutine, srcstat ("srcstat Subroutine" on page 309) subroutine, srcstattxt ("srcstattxt Subroutine") subroutine, srcstop ("srcstop Subroutine" on page 316) subroutine, srcstrt ("srcstrt Subroutine" on page 318) subroutine.

List of SRC Subroutines, Programming Subsystem Communication with the SRC, System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcstattxt Subroutine

Purpose

Gets the System Resource Controller (SRC) status text representation for a status code.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
char *srcstattxt ( StatusCode)
short StatusCode;
```

Description

The **srcstattxt** subroutine, given an SRC status code, gets the text representation and returns a pointer to this text.

Parameters

StatusCode Specifies an SRC status code to be translated into meaningful text.

Return Values

The **srcstattxt** subroutine returns a pointer to the text representation of a status code.

Related Information

List of SRC Subroutines, Programming Subsystem Communication with the SRC, System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcstattxt_r Subroutine

Purpose

Gets the status text representation for an SRC status code.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
char *srcstattxt r (StatusCode, Text)
short StatusCode;
char *Text:
```

Description

The **srcstattxt** r subroutine, given an SRC status code, gets the text representation and returns it in a caller-supplied buffer. This routine is threadsafe and reentrant.

Parameters

StatusCode Specifies an SRC status code to be translated into meaningful text.

Points to a caller-supplied buffer where the text will be returned. If the length of the text is Text

unknown, the maximum text length can be used when allocating the buffer. The maximum text

length is SRC_STAT_MAX in /usr/include/spc.h (64 bytes).

Return Values

Upon successful completion, the srcstattxt_r subroutine returns the address of the caller-supplied buffer. Otherwise, no text is returned and the subroutine returns NULL.

Related Information

The **src err msg r** ("src err msg r Subroutine" on page 290), **srcsbuf r** ("srcsbuf r Subroutine" on page 296), srcsrqt_r ("srcsrqt_r Subroutine" on page 305), srcrrqs_r ("srcrrqs_r Subroutine" on page 292), and **srcstat** r ("srcstat r Subroutine" on page 311) subroutines.

List of SRC Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcstop Subroutine

Purpose

Stops a System Resource Controller (SRC) subsystem.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include <spc.h>
srcstop(Host, SubsystemName, SubsystemPID, StopType)
srcstop(ReplyLength, ServerReply, StopFrom)
char * Host, * SubsystemName;
int SubsystemPID, StopFrom;
short StopType, * ReplyLength;
struct srcrep * ServerReply;
```

Description

The srcstop subroutine sends a stop subsystem request to a subsystem and waits for a stop reply from the System Resource Controller (SRC) or the subsystem. The srcstop subroutine can only stop a subsystem that was started by the SRC.

Parameters

Host	Specifies the foreign host on which this stop action is requested. If the host is the null
	value, the request is sent to the SRC on the local host. The local user must be running as
	"root". The remote system must be configured to accept remote System Resource
	Controller requests. That is, the srcmstr daemon (see /etc/inittab) must be started with the
	-r flag and the /etc/hosts.equiv or .rhosts file must be configured to allow remote
	requests.

SubsystemName Specifies the name of the subsystem to stop.

SubsystemPID Specifies the process ID of the system to stop as returned by the srcstrt subroutine. If you

specify a null SubsystemPID parameter, you must specify a SubsystemName parameter.

StopType

Specifies the type of stop requested of the subsystem. If this parameter is null, a normal stop is assumed. The *StopType* parameter must be one of the following values:

CANCEL

Requires a quick stop of the subsystem. The subsystem is sent a **SIGTERM** signal. After the wait time defined in the subsystem object, the SRC issues a SIGKILL signal to the subsystem. This waiting period allows the subsystem to clean up all its resources and terminate. The stop reply is returned by the SRC.

FORCE

Requests a quick stop of the subsystem and all its subservers. The stop reply is returned by the SRC for subsystems that use signals and by the subsystem for other communication types.

NORMAL

Requests the subsystem to terminate after all current subsystem activity has completed. The stop reply is returned by the SRC for subsystems that use signals and by the subsystem for other communication types.

ReplyLength

Specifies the maximum length, in bytes, of the stop reply. On return from the **srcstop** subroutine, this field is set to the actual length of the subsystem reply packet received.

ServerReply **StopFrom**

Points to an svrreply structure that will receive the subsystem stop reply.

Specifies whether the srcstop subroutine is to display stop results to standard output. If the StopFrom parameter is set to SSHELL, the stop results are displayed to standard output and the srcstop subroutine returns successfully. If the StopFrom parameter is set to SDAEMON, the stop results are not displayed to standard output, but are passed back to the caller.

Return Values

Upon successful completion, the srcstop subroutine returns SRC OK or SRC STPOK.

Error Codes

The **srcstop** subroutine fails if one or more of the following are true:

SRC BADFSIG The stop force signal is an invalid signal. SRC_BADNSIG The stop normal signal is an invalid signal.

SRC_BADSOCK The stop request could not be passed to the subsystem on its

communication socket.

SRC_DMNA The SRC daemon is not active.

SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file. SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC_INVALID_USER The user is not root or group system.

SRC_MMRY An SRC component could not allocate the memory it needs.

SRC_NORPLY The request timed out waiting for a response. SRC_NOTROOT The SRC daemon is not running as root.

SRC_SOCK There is a problem with SRC socket communications.

SRC_STPG The request was not passed to the subsystem. The subsystem is

stopping.

SRC SVND The subsystem is unknown to the SRC daemon.

SRC UDP The remote SRC port is not defined in the /etc/services file.

SRC_UHOST The foreign host is not known. SRC PARM Invalid parameter passed.

Examples

1. To stop all instances of a subsystem, enter:

```
int rc;
struct svrreply svrreply;
short replen=sizeof(svrreply);
rc=srcstop("MaryC","srctest",0,FORCE,&replen,&svrreply,SDAEMON);
```

This request stops a subsystem with a stop type of FORCE for all instances of the subsystem srctest on the MaryC machine and does not print a message to standard output about the status of the stop.

2. To stop a single instance of a subsystem, enter:

```
struct svrreply svrreply;
short replen=sizeof(svrreply);
rc=srcstop("","",999,CANCEL,&replen,&svrreply,SSHELL);
```

This request stops a subsystem with a stop type of CANCEL, with the process ID of 999 on the local machine and prints a message to standard output about the status of the stop.

Files

/etc/services Defines sockets and protocols used for Internet services.

/dev/SRC Specifies the AF_UNIX socket file.

/dev/.SRC-unix Specifies the location for temporary socket files.

System Resource Controller (SRC) Overview for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

srcstrt Subroutine

Purpose

Starts a System Resource Controller (SRC) subsystem.

Library

System Resource Controller Library (libsrc.a)

Syntax

```
#include<spc.h>
srcstrt (Host, SubsystemName, Environment, Arguments, Restart, StartFrom)
char * Host, * SubsystemName;
char * Environment, * Arguments;

318 AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions, Volume 2
```

unsigned int Restart; int StartFrom;

Description

The srcstrt subroutine sends a start subsystem request packet and waits for a reply from the System Resource Controller (SRC).

Parameters

Host Specifies the foreign host on which this start subsystem action is requested. If the host is

null, the request is sent to the SRC on the local host. The local user must be running as "root". The remote system must be configured to accept remote System Resource

Controller requests. That is, the srcmstr daemon (see /etc/inittab) must be started with the

-r flag and the /etc/hosts.equiv or .rhosts file must be configured to allow remote

requests.

SubsystemName Specifies the name of the subsystem to start.

Environment Specifies a string that is placed in the subsystem environment when the subsystem is

> executed. The combined values of the Environment and Arguments parameters cannot exceed a maximum of 2400 characters. Otherwise, the srcstrt subroutine will fail. The environment string is parsed by the SRC according to the same rules used by the shell. For example, quoted strings are passed as a single Environment value, and blanks outside a

quoted string delimit each environment value.

Specifies a string that is passed to the subsystem when the subsystem is executed. The Arguments

> string is parsed from the command line and appended to the command line arguments from the subsystem object class. The combined values of the Environment and Arguments parameters cannot exceed a maximum of 2400 characters. Otherwise, the srcstrt subroutine will fail. The command argument is parsed by the SRC according to the same rules used by the shell. For example, quoted strings are passed as a single argument, and

blanks outside a quoted string delimit each argument.

Restart Specifies override on subsystem restart. If the Restart parameter is set to SRCNO, the

subsystem's restart definition from the subsystem object class is used. If the Restart parameter is set to SRCYES, the restart of a subsystem is not attempted if it terminates

abnormally.

StartFrom Specifies whether the srcstrt subroutine is to display start results to standard output. If the

> StartFrom parameter is set to SSHELL, the start results are displayed to standard output, and the srcstrt subroutine always returns successfully. If the StartFrom parameter is set to SDAEMON, the start results are not displayed to standard output but are passed back to

the caller.

Return Values

When the StartFrom parameter is set to SSHELL, the srcstrt subroutine returns the value SRC_OK. Otherwise, it returns the subsystem process ID.

Error Codes

The **srcstrt** subroutine fails if any of the following are true:

SRC_AUDITID The audit user ID is invalid. SRC DMNA The SRC daemon is not active.

SRC FEXE The subsystem could not be **fork**ed and **exec**ed. SRC_INET_AUTHORIZED_HOST The local host is not in the remote /etc/hosts.equiv file.

SRC_INET_INVALID_HOST On the remote host, the local host is not known.

SRC_INVALID_USER The user is not root or group system.

SRC_INPT The subsystem standard input file could not be established. SRC_MMRY An SRC component could not allocate the memory it needs. SRC_MSGQ The subsystem message queue could not be created.

SRC_MULT

Multiple instance of the subsystem are not allowed.

SRC_NORPLY

The request timed out waiting for a response.

SRC OUT

The subsystem standard output file could not be established.

SRC_PIPE A pipe could not be established for the subsystem.

SRC_SERR

The subsystem standard error file could not be established.
SRC_SUBSOCK

The subsystem communication socket could not be created.

SRC_SUBSYSID The system user ID is invalid.

SRC_SOCK
There is a problem with SRC socket communications.
SRC_SVND
The subsystem is unknown to the SRC daemon.

SRC_UDP The SRC port is not defined in the /etc/services header file.

SRC_UHOST The foreign host is not known.

Examples

1. To start a subsystem passing the *Environment* and *Arguments* parameters, enter:

```
rc=srcstrt("","srctest","HOME=/tmpTERM=ibm6155",
"-z\"thezflagargument\"",SRC_YES,SSHELL);
```

This starts the srctest subsystem on the local host, placing HOME=/tmp, TERM=ibm6155 in the environment and using -z and thezflagargument as two arguments to the subsystem. This also displays the results of the start command to standard output and allows the SRC to restart the subsystem should it end abnormally.

2. To start a subsystem on a foreign host, enter:

```
rc=srcstrt("MaryC","srctest","","",SRC NO,SDAEMON);
```

This starts the srctest subsystem on the MaryC machine. This does not display the results of the start command to standard output and does not allow the SRC to restart the subsystem should it end abnormally.

Files

/etc/services Defines sockets and protocols used for Internet services.

/dev/SRC Specifies the AF_UNIX socket file.

/dev/.SRC-unix Specifies the location for temporary socket files.

List of SRC Subroutines, Programming Subsystem Communication with the SRC, System Resource Controller (SRC) Overview for Programmers in *AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.*

ssignal or gsignal Subroutine

Purpose

Implements a software signal facility.

Library

Standard C Library (libc.a)

Syntax

```
#include <signal.h>
void (*ssignal ( Signal, Action))()
int Signal;
void (*Action)();
int gsignal (Signal)
int Signal;
```

Description

Attention: Do not use the **ssignal** or **gsignal** subroutine in a multithreaded environment.

The ssignal and gsignal subroutines implement a software facility similar to that of the signal and kill subroutines. However, there is no connection between the two facilities. User programs can use the ssignal and gsignal subroutines to handle exceptional processing within an application. The signal subroutine and related subroutines handle system-defined exceptions.

The software signals available are associated with integers in the range 1 through 16. Other values are reserved for use by the C library and should not be used.

The **ssignal** subroutine associates the procedure specified by the *Action* parameter with the software signal specified by the Signal parameter. The **gsignal** subroutine raises the Signal, causing the procedure specified by the Action parameter to be taken.

The Action parameter is either a pointer to a user-defined subroutine, or one of the constants SIG_DFL (default action) and SIG IGN (ignore signal). The ssignal subroutine returns the procedure that was previously established for that signal. If no procedure was established before, or if the signal number is illegal, then the ssignal subroutine returns the value of SIG DFL.

The **gsignal** subroutine raises the signal specified by the *Signal* parameter by doing the following:

- If the procedure for the Signal parameter is SIG DFL, the qsignal subroutine returns a value of 0 and takes no other action.
- If the procedure for the Signal parameter is SIG_IGN, the gsignal subroutine returns a value of 1 and takes no other action.
- If the procedure for the Signal parameter is a subroutine, the Action value is reset to the SIG_DFL procedure and the subroutine is called, with the Signal value passed as its parameter. The **gsignal** subroutine returns the value returned by the signal-handling routine.
- · If the Signal parameter specifies an illegal value or if no procedure is specified for that signal, the gsignal subroutine returns a value of 0 and takes no other action.

Parameters

Signal Specifies a signal. Action Specifies a procedure.

Related Information

The kill or killpg subroutine, signal ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine.

statacl or fstatacl Subroutine

Purpose

Retrieves the AIXC ACL type access control information for a file.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/acl.h>
#include <sys/stat.h>
int statacl (Path, Command, ACL, ACLSize)
char * Path;
int Command;
struct acl * ACL;
int ACLSize;
int fstatacl (FileDescriptor, Command, ACL, ACLSize)
int FileDescriptor;
int Command;
struct acl *ACL;
int ACLSize;
```

Description

The statacl and fstatacl subroutines return the access control information for a file system object if the ACL associated is of AIXC type. If the ACL associated is of different type or if the underlying physical file system does not support AIXC ACL type, error could be returned by these interfaces. If the statacl subroutine is used on NFS V4 files, invalid results are returned.

Parameters

Path FileDescriptor Command

Specifies a pointer to the path name of a file. Specifies the file descriptor of an open file.

Specifies the mode of the path interpretation for Path, specifically whether to retrieve information about a symbolic link or mount point. Valid values for the Command parameter are defined in the stat.h file and include:

- STX_LINK
- STX_MOUNT
- STX NORMAL

ACL

Specifies a pointer to a buffer to contain the AIXC-type Access Control List (ACL) of the file system object. The format of an AIXC ACL is defined in the **sys/acl.h** file and includes the following members:

acl len

Size of the Access Control List (ACL).

Note: The entire ACL for a file cannot exceed one memory page (4096 bytes).

acl mode

File mode.

Note: The valid values for the acl mode are defined in the sys/mode.h file.

u access

Access permissions for the file owner.

g access

Access permissions for the file group.

o access

Access permissions for default class others.

acl_ext[]

An array of the extended entries for this access control list.

The members for the base ACL (owner, group, and others) may contain the following bits, which are defined in the **sys/access.h** file:

R ACC

Allows read permission.

W_ACC

Allows write permission.

X_ACC Allows execute or search permission.

ACLSize Specifies the size of the buffer to contain the ACL. If this value is too small, the first word of the ACL is set to the size of the buffer needed.

Return Values

On successful completion, the **statacl** and **fstatacl** subroutines return a value of 0. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **statacl** subroutine fails if one or more of the following are true:

ENOTDIR A component of the *Path* prefix is not a directory.

ENOENT A component of the *Path* does not exist or has the **disallow**

truncation attribute (see the ulimit subroutine).

ENOENT The *Path* parameter was null.

EACCESSearch permission is denied on a component of the *Path* prefix.

The *Path* parameter points to a location outside of the allocated

address space of the process.

ESTALEThe process' root or current directory is located in a virtual file

system that has been unmounted.

ELOOP Too many symbolic links were encountered in translating the *Path*

parameter.

ENOENT A symbolic link was named, but the file to which it refers does not

exist.

ENAMETOOLONG A component of the *Path* parameter exceeded 255 characters, or

the entire Path parameter exceeded 1023 characters.

The **fstatacl** subroutine fails if the following is true:

EBADF The file descriptor FileDescriptor is not valid.

The **statacl** or **fstatacl** subroutine fails if one or more of the following are true:

EFAULT The ACL parameter points to a location outside of the allocated address space of the process.

EINVAL The Command parameter is not a value of STX_LINK, STX_MOUNT, STX_NORMAL.

ENOSPC The ACLSize parameter indicates the buffer at ACL is too small to hold the Access Control List. In this

case, the first word of the buffer is set to the size of the buffer required.

EIO An I/O error occurred during the operation.

If Network File System (NFS) is installed on your system, the statacl and fstatacl subroutines can also fail if the following is true:

ETIMEDOUT The connection timed out.

Related Information

The chacl subroutine, stat ("statx, stat, Istat, fstatx, fstat, fullstat, ffullstat, stat64, Istat64, fstat64, stat64x, fstat64x, or Istat64x Subroutine" on page 329) subroutine.

The acl_chg subroutine, acl_get subroutine, acl_put subroutine, acl_set subroutine.

The aclx_get Subroutine, aclx_put Subroutine.

The aciget command, aciput command, chmod command.

List of Security and Auditing Subroutines and Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

statea Subroutine

Purpose

Provides information about an extended attribute.

Syntax

```
#include <svs/ea.h>
```

```
int statea(const char *path, const char *name, struct stat64x *buffer)
int fstatea(int filedes, const char *name, struct stat64x *buffer)
int lstatea(const char *path, const char *name, struct stat64x *buffer)
```

Description

Extended attributes are name: value pairs associated with the file system objects (such as files, directories, and symlinks). They are extensions to the normal attributes that are associated with all of the objects in the file system (that is, the **stat(2)** data).

Do not define an extended attribute name with the 8-character prefix "(0xF8)SYSTEM(0xF8)". Prefix "(0xF8)SYSTEM(0xF8)" is reserved for system use only.

Note: 0xF8 represents a non-printable character.

The **statea** subroutine gets information about the extended attribute name name associated with the file system object specified by path. The fstatea subroutine is identical to statea, except that it takes a file descriptor instead of a path. The Istatea subroutine is identical to statea, except, in the case of a symbolic link, the link itself is interrogated rather than the file that it refers to.

The **statea** subroutine uses a **stat64x** structure to return the information. Note that all values in this structure are 64-bit, including the devices and size. A normal struct stat cannot be passed to statea. For more information, see the "statx, stat, Istat, fstatx, fstat, fullstat, ffullstat, stat64, Istat64, fstat64, stat64x, fstat64x, or Istat64x Subroutine" on page 329.

Parameters

path The path name of the file.

The name of the extended attribute. An extended attribute name is a NULL-terminated string. name

buffer A pointer to the stat structure in which information is returned.

A file descriptor for the file. filedes

Return Values

If the statea subroutine succeeds, 0 is returned. Upon failure, -1 is returned and errno is set appropriately.

Error Codes

EACCES Caller lacks read permission on the base file, or lacks the appropriate ACL privileges for

named attribute lookup.

EFAULT A bad address was passed for path, name, or buffer.

EFORMAT File system is capable of supporting EAs, but EAs are disabled. **EINVAL** A path-like name should not be used (such as zml/file, . and ..).

ENAMETOOLONG The path or name value is too long. **ENOATTR** No attribute named *name* is present.

ENOTSUP Extended attributes are not supported by the file system.

Related Information

The getea Subroutine, listea Subroutine, "removeea Subroutine" on page 57, "setea Subroutine" on page 174, and "statx, stat, Istat, fstatx, fstat, fullstat, ffullstat, stat64, Istat64, stat64x, fstat64x, or Istat64x Subroutine" on page 329.

statfs, fstatfs, statfs64, fstatfs64, or ustat Subroutine

Purpose

Gets file system statistics.

Library

Standard C Library (libc.a)

Syntax

#include <sys/statfs.h>

```
int statfs ( Path, StatusBuffer)
char *Path:
struct statfs *StatusBuffer;
int fstatfs (FileDescriptor, StatusBuffer)
int FileDescriptor;
struct statfs *StatusBuffer;
int statfs64 ( Path, StatusBuffer64)
char *Path;
struct statfs64 *StatusBuffer64;
int fstatfs64 (FileDescriptor, StatusBuffer64)
int FileDescriptor;
struct statfs64 *StatusBuffer64;
#include <sys/types.h>
#include <ustat.h>
int ustat ( Device, Buffer)
dev_t Device;
struct ustat *Buffer;
```

Description

The **statfs** and **fstatfs** subroutines return information about the mounted file system that contains the file named by the Path or FileDescriptor parameters. The returned information is in the format of a statfs structure, described in the sys/statfs.h file.

The statfs64 and fstatfs64 subroutines are similar to the statfs and fstatfs subroutines except that the returned information is in the format of a statfs64 structure, described in the sys/statfs.h file, instead of a statfs structure.

The **statfs64** structure provides invariant 64-bit fields for the file system blocks (or inodes) sizes or counts, and the file system ID. This structure allows statfs64 and fstatfs64 to always return the specified information in invariant 64-bit sizes.

The ustat subroutine also returns information about a mounted file system identified by Device. This device identifier is for any given file and can be determined by examining the st dev field of the stat structure defined in the sys/stat.h file. The returned information is in the format of a ustat structure, described in the ustat.h file. The ustat subroutine is superseded by the statfs and fstatfs subroutines. Use one of these (statfs and fstatfs) subroutines instead.

Note: The ustat subroutine does not work for 64-bit sizes.

Parameters

Path The path name of any file within the mounted file system.

FileDescriptor A file descriptor obtained by a successful open or fcntl subroutine. A file descriptor is a

small positive integer used instead of a file name.

StatusBuffer A pointer to a statfs buffer for the returned information from the statfs or fstatfs

subroutine.

StatusBuffer64 A pointer to a statfs64 buffer for the returned information from the statfs64 or fstatfs64

subroutine.

The ID of the device. It corresponds to the st rdev field of the structure returned by the Device

stat subroutine. The stat subroutine and the sys/stat.h file provide more information

about the device driver.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The statfs, fstatfs, statfs64, fstatfs64, and ustat subroutines fail if the following is true:

EFAULT The Buffer parameter points to a location outside of the allocated address space of the process.

The **fstatfs** or **fstatfs64** subroutine fails if the following is true:

The FileDescriptor parameter is not a valid file descriptor. EIO An I/O error occurred while reading from the file system.

The statfs or statfs64 subroutine can be unsuccessful for other reasons. For a list of additional errors, see "Base Operating System Error Codes For Services That Require Path-Name Resolution".

Related Information

The stat ("statx, stat, Istat, fstatx, fstat, fullstat, ffullstat, stat64, Istat64, fstat64, stat64x, fstat64x, or Istat64x Subroutine" on page 329) subroutine.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

statvfs, fstatvfs, statvfs64, or fstatvfs64 Subroutine

Purpose

Returns information about a file system.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/statvfs.h>
int statvfs ( Path, Buf)
const char *Path;
struct statvfs *Buf;
int fstatvfs ( Fildes, Buf)
int Fildes;
struct statvfs *Buf;
int statvfs64 ( Path, Buf)
const char *Path;
struct statvfs64 *Buf;
```

int fstatvfs64 (Fildes, Buf) int Fildes: struct statvfs64 *Buf;

Description

The **statyfs** and **fstatyfs** subroutines return descriptive information about a mounted file system containing the file referenced by the Path or Fildes parameters. The Buf parameter is a pointer to a structure which will by filled by the subroutine call.

The Path and Fildes parameters must reference a file which resides on the file system. Read, write, or execute permission of the named file is not required, but all directories listed in the pathname leading to the file must be searchable.

The statvfs64 and fstatvfs64 subroutines are similar to the statvfs and fstatvfs subroutines except that the returned information is in the format of a statvfs64 structure instead of a statvfs structure.

The **statyfs64** structure provides invariant 64-bit fields for the file system blocks (or inodes) sizes and counts, and the file system ID. This structure allows statvfs64 and fstatvfs64 to always return the specified information in invariant 64-bit values.

Parameters

Path The path name identifying the file.

Buf A pointer to a statvfs or statvfs64 structure in which information is returned. The statvfs or statvfs64

structure is described in the sys/statvfs.h header file.

Fildes The file descriptor identifying the open file.

Return Values

Successful completion.

-1 Not successful and errno set to one of the following.

Error Codes

EACCES Search permission is denied on a component of the path. **EBADF** The file referred to by the Fildes parameter is not an open file

descriptor.

EIO An I/O error occurred while reading from the filesystem. **ELOOP** Too many symbolic links encountered in translating path. **ENAMETOOLONG** The length of the pathname exceeds PATH MAX, or name

component is longer than NAME_MAX.

ENOENT The file referred to by the *Path* parameter does not exist. **ENOMEM** A memory allocation failed during information retrieval. **ENOTDIR** A component of the *Path* parameter prefix is not a directory. **EOVERFLOW** One of the values to be returned cannot be represented correctly

in the structure pointed to by buf.

Related Information

The stat ("statx, stat, Istat, fstatx, fstat, fullstat, ffullstat, stat64, Istat64, fstat64, stat64x, fstat64x, or Istat64x Subroutine" on page 329) subroutine, statfs ("statfs, fstatfs, statfs64, fstatfs64, or ustat Subroutine" on page 325) subroutine.

statx, stat, Istat, fstatx, fstat, fullstat, ffullstat, stat64, Istat64, fstat64x, stat64x, or Istat64x Subroutine

Purpose

Provides information about a file or shared memory object.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/stat.h>
int stat ( Path, Buffer)
const char *Path;
struct stat *Buffer;
int lstat (Path, Buffer)
const char *Path;
struct stat *Buffer;
int fstat ( FileDescriptor, Buffer)

int FileDescriptor;
struct stat64x *Buffer;
#include <sys/fullstat.h>
int fullstat (Path, Command, Buffer)
struct fullstat *Buffer;
char *Path;
int Command;
```

int ffullstat (FileDescriptor, Command, Buffer) struct fullstat *Buffer; int FileDescriptor; int Command;

Description

The **stat** subroutine obtains information about the file named by the *Path* parameter. Read, write, or execute permission for the named file is not required, but all directories listed in the path leading to the file must be searchable. The file information, which is a subset of the stat structure, is written to the area specified by the Buffer parameter.

The **Istat** subroutine obtains information about a file that is a symbolic link. The **Istat** subroutine returns information about the link, while the stat subroutine returns information about the file referenced by the link.

The **fstat** subroutine obtains information about the open file or shared memory object referenced by the FileDescriptor parameter. The **fstatx** subroutine obtains information about the open file or shared memory object referenced by the FileDescriptor parameter, as in the fstat subroutine.

The st mode, st dev, st uid, st gid, st atime, st ctime, and st mtime fields of the stat structure have meaningful values for all file types. The statx, stat, Istat, fstatx, fstat, fullstat, or ffullstat subroutine sets the st nlink field to a value equal to the number of links to the file.

The **statx** subroutine obtains a greater set of file information than the **stat** subroutine. The *Path* parameter is processed differently, depending on the contents of the Command parameter. The Command parameter provides the ability to collect information about symbolic links (as with the Istat subroutine) as well as information about mount points and hidden directories. The statx subroutine returns the amount of information specified by the Length parameter.

The fullstat and ffullstat subroutines are interfaces maintained for backward compatibility. With the exception of some field names, the fullstat structure is identical to the stat structure.

The stat64, Istat64, and fstat64 subroutines are similar to the stat, Istat, fstat subroutines except that they return file information in a stat64 structure instead of a stat structure. The information is identical except that the st size field is defined to be a 64-bit size. This allows stat64, Istat64, and fstat64 to return file sizes which are greater than **OFF MAX** (2 gigbytes minus 1).

In the large file enabled programming environment, stat is redefined to be stat64, Istat is redefined to be Istat64 and fstat is redefined to be fstat64.

The stat64x, Istat64x, and fstat64x subroutines are similar to the stat, Istat, fstat subroutines except that they return file information in a stat64x structure instead of a stat structure. The information is identical except the following fields are defined to be 64-bit sizes: st dev, st ino, st rdev, st size, st atime, st mtime, st ctime, st blksize, and st blocks.

Note: The 64-bit st dev field always contains a 64-bit device ID, where the first two bits are reserved, the next 30 bits are the device major number, and the next 32 bits are the device minor number.

This allows stat64x, Istat64x, and fstat64x to return the specified information in invariant 64-bit sizes, regardless of the mode of an application or the kernel it is running on.

Parameters

Path Specifies the path name identifying the file. This name is interpreted differently depending on the interface used.

FileDescriptor

Specifies the file descriptor identifying the open file or shared memory object.

Note: If the *FileDescriptor* parameter references a shared memory object, only the *st_uid*, *st_gid*, st size, and st mode fields of the stat structure are filled, and only the S IRUSR, S IWUSR, S IRGRP, S IWGRP, S IROTH, and S IWOTH file permission bits are valid.

Buffer Specifies a pointer to the stat structure in which information is returned. The stat structure is described in the sys/stat.h file.

Length

Indicates the amount of information, in bytes, to be returned. Any value between 0 and the value returned by the STATXSIZE macro, inclusive, may be specified. The following macros may be used:

STATSIZE

Specifies the subset of the **stat** structure that is normally returned for a **stat** call.

FULLSTATSIZE

Specifies the subset of the stat (fullstat) structure that is normally returned for a fullstat call.

STATXSIZE

Specifies the complete stat structure. 0 specifies the complete stat structure, as if **STATXSIZE** had been specified.

Command

Specifies a processing option. For the statx subroutine, the Command parameter determines how to interpret the path name provided, specifically, whether to retrieve information about a symbolic link, hidden directory, or mount point. Flags can be combined by logically ORing them together. The following options are possible values:

STX_LINK

If the Command parameter specifies the STX_LINK flag and the Path parameter is a path name that refers to a symbolic link, the statx subroutine returns information about the symbolic link. If the STX LINK flag is not specified, the statx subroutine returns information about the file to which the link refers.

If the Command parameter specifies the STX_LINK flag and the Path value refers to a symbolic link, the st mode field of the returned stat structure indicates that the file is a symbolic link.

STX HIDDEN

If the Command parameter specifies the STX_HIDDEN flag and the Path value is a path name that refers to a hidden directory, the statx subroutine returns information about the hidden directory. If the STX_HIDDEN flag is not specified, the statx subroutine returns information about a subdirectory of the hidden directory.

If the Command parameter specifies the STX HIDDEN flag and Path refers to a hidden directory, the st mode field of the returned stat structure indicates that this is a hidden directory.

STX MOUNT

If the Command parameter specifies the STX MOUNT flag and the Path value is the name of a file or directory that has been mounted over, the statx subroutine returns information about the mounted-over file. If the STX MOUNT flag is not specified, the statx subroutine returns information about the mounted file or directory (the root directory of a virtual file system).

If the Command parameter specifies the STX MOUNT flag, the FS MOUNT bit in the st flag field of the returned stat structure is set if, and only if, this file is mounted over.

If the Command parameter does not specify the STX_MOUNT flag, the FS_MOUNT bit in the st flag field of the returned stat structure is set if, and only if, this file is the root directory of a virtual file system.

STX NORMAL

If the Command parameter specifies the STX_NORMAL flag, then no special processing is performed on the Path value. This option should be used when STX_LINK, STX_HIDDEN, and STX_MOUNT flags are not desired.

For the **fstatx** subroutine, there are currently no special processing options. The only valid value for the Command parameter is the STX_NORMAL flag.

For the fullstat and ffullstat subroutines, the Command parameter may specify the FL_STAT flag, which is equivalent to the STX_NORMAL flag, or the FL_NOFOLLOW flag, which is equivalent to STX LINK flag.

STX 64

If the Command parameter specifies the STX 64 flag and the file size is greater than OFF MAX, then statx succeeds and returns the file size. Otherwise, statx fails and sets the errno to EOVERFLOW.

STX 64X

If the Command parameter specifies the STX 64X flag and the stat structure size is not equal to the size of STX 64X, statx fails and sets the errno to EINVAL.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

EOVERFLOW

The stat, Istat, statx, and fullstat subroutines are unsuccessful if one or more of the following are true:

FACCES Search permission is denied for one component of the path prefix. **ENAMETOOLONG** The length of the path prefix exceeds the PATH MAX flag value or

a path name is longer than the NAME_MAX flag value while the

POSIX_NO_TRUNC flag is in effect.

ENOTDIR A component of the path prefix is not a directory.

Either the Path or the Buffer parameter points to a location outside **EFAULT**

of the allocated address space of the process.

ENOENT The file named by the *Path* parameter does not exist.

The file size or the i-node number is larger than the maximum

value that can be represented in the **stat** structure pointed to by

the Buffer parameter.

The stat, Istat, statx, and fullstat subroutines can be unsuccessful for other reasons. See "Base Operating System Error Codes for Services that Require Path-Name Resolution" for a list of additional errors.

The **fstat**, **fstatx**, and **ffullstat** subroutines fail if one or more of the following are true:

EBADF The FileDescriptor parameter is not a valid file descriptor.

EFAULT The Buffer parameter points to a location outside the allocated address space of the process.

EIO An input/output (I/O) error occurred while reading from the file system. The **statx** and **fstatx** subroutines are unsuccessful if one or more of the following are true:

EINVAL The Length value is not between 0 and the value returned by the STATSIZE macro, inclusive.

EINVAL The Command parameter contains an unacceptable value.

Files

/usr/include/sys/fullstat.h Contains the fullstat structure.

/usr/include/sys/mode.h Defines values on behalf of the stat.h file.

strcat, strncat, strxfrm, strcpy, strncpy, or strdup Subroutine

Purpose

Copies and appends strings in memory.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
char * strcat ( String1, String2)
char *String1;
const char *String2;
char * strncat (String1, String2, Number)
char *String1;
const char *String2;
size_t Number;
size_t strxfrm (String1, String2, Number)
char *String1;
const char *String2;
size t Number;
char * strcpy (String1, String2)
char *String1;
const char *String2;
char * strncpy (String1, String2, Number)
char *String1;
const char *String2;
size t Number;
```

char * strdup (String1) const char *String1;

Description

The strcat, strncat, strxfrm, strcpy, strncpy, and strdup subroutines copy and append strings in memory.

The String1 and String2 parameters point to strings. A string is an array of characters terminated by a null character. The strcat, strncat, strcpy, and strncpy subroutines all alter the string in the String1 parameter. However, they do not check for overflow of the array to which the *String1* parameter points. String movement is performed on a character-by-character basis and starts at the left. Overlapping moves toward the left work as expected, but overlapping moves to the right may give unexpected results. All of these subroutines are declared in the **string.h** file.

The **strcat** subroutine adds a copy of the string pointed to by the *String2* parameter to the end of the string pointed to by the String1 parameter. The strcat subroutine returns a pointer to the null-terminated result.

The **strncat** subroutine copies a number of bytes specified by the *Number* parameter from the *String2* parameter to the end of the string pointed to by the String1 parameter. The subroutine stops copying before the end of the number of bytes specified by the Number parameter if it encounters a null character in the String2 parameter's string. The **strncat** subroutine returns a pointer to the null-terminated result. The **strncat** subroutine returns the value of the *String1* parameter.

The strxfrm subroutine transforms the string pointed to by the String2 parameter and places it in the array pointed to by the String1 parameter. The **strxfrm** subroutine transforms the entire string if possible, but places no more than the number of bytes specified by the *Number* parameter in the array pointed to by the String1 parameter. Consequently, if the Number parameter has a value of 0, the String1 parameter can be a null pointer. The strxfrm subroutine returns the length of the transformed string, not including the terminating null byte. If the returned value is equal to or more than that of the Number parameter, the contents of the array pointed to by the String1 parameter are indeterminable. If the number of bytes specified by the Number parameter is 0, the strxfrm subroutine returns the length required to store the transformed string, not including the terminating null byte. The **strxfrm** subroutine is determined by the LC COLLATE category.

The **strcpy** subroutine copies the string pointed to by the *String2* parameter to the character array pointed to by the String1 parameter. Copying stops after the null character is copied. The strcpy subroutine returns the value of the String1 parameter, if successful. Otherwise, a null pointer is returned.

The **strncpy** subroutine copies the number of bytes specified by the *Number* parameter from the string pointed to by the String2 parameter to the character array pointed to by the String1 parameter. If the String2 parameter value is less than the specified number of characters, then the strncpy subroutine pads the String1 parameter with trailing null characters to a number of bytes equaling the value of the Number parameter. If the String2 parameter is exactly the specified number of characters or more, then only the number of characters specified by the *Number* parameter are copied and the result is not terminated with a null byte. The **strncpy** subroutine returns the value of the *String1* parameter.

The **strdup** subroutine returns a pointer to a new string, which is a duplicate of the string pointed to by the String1 parameter. Space for the new string is obtained by using the malloc subroutine. A null pointer is returned if the new string cannot be created.

Parameters

Number Specifies the number of bytes in a string to be copied or transformed. Points to a string to which the specified data is copied or appended. String1

Error Codes

The strcat, strncat, strxfrm, strcpy, strncpy, and strdup subroutines fail if the following occurs:

EFAULT A string parameter is an invalid address.

In addition, the **strxfrm** subroutine fails if:

EINVAL A string parameter contains characters outside the domain of the collating sequence.

strcmp, strncmp, strcasecmp, strncasecmp, or strcoll Subroutine

Purpose

Compares strings in memory.

Library

Standard C Library (libc.a)

Syntax

#include <string.h>

int strcmp (String1, String2) const char *String1, *String2;

int strncmp (String1, String2, Number) const char *String1, *String2; size t Number;

int strcoll (String1, String2) const char *String1, *String2;

#include <strings.h>

int strcasecmp (String1, String2) const char *String1, *String2;

int strncasecmp (String1, String2, Number) const char *String1, *String2; size_t Number;

Description

The strcmp, strncmp, strcasecmp, strncasecmp, and strcoll subroutines compare strings in memory.

The String1 and String2 parameters point to strings. A string is an array of characters terminated by a null character.

The **strcmp** subroutine performs a case-sensitive comparison of the string pointed to by the *String1* parameter and the string pointed to by the String2 parameter, and analyzes the extended ASCII character set values of the characters in each string. The **strcmp** subroutine compares **unsigned char** data types. The **strcmp** subroutine then returns a value that is:

- Less than 0 if the value of string String1 is lexicographically less than string String2.
- Equal to 0 if the value of string String1 is lexicographically equal to string String2.
- Greater than 0 if the value of string String1 is lexicographically greater than string String2.

The **strncmp** subroutine makes the same comparison as the **strcmp** subroutine, but compares up to the maximum number of pairs of bytes specified by the *Number* parameter.

The strcasecmp subroutine performs a character-by-character comparison similar to the strcmp subroutine. However, the **strcasecmp** subroutine is not case-sensitive. Uppercase and lowercase letters are mapped to the same character set value. The sum of the mapped character set values of each string is used to return a value that is:

- Less than 0 if the value of string String1 is lexicographically less than string String2.
- Equal to 0 if the value of string String1 is lexicographically equal to string String2.
- Greater than 0 if the value of string String1 is lexicographically greater than string String2.

The **strncasecmp** subroutine makes the same comparison as the **strcasecmp** subroutine, but compares up to the maximum number of pairs of bytes specified by the *Number* parameter.

Note: Both the **strcasecmp** and **strncasecmp** subroutines only work with 7-bit ASCII characters.

The **strcoll** subroutine works the same as the **strcmp** subroutine, except that the comparison is based on a collating sequence determined by the LC_COLLATE category. If the strcmp subroutine is used on transformed strings, it returns the same result as the strcoll subroutine for the corresponding untransformed strings.

Parameters

Number The number of bytes in a string to be examined.

String1 Points to a string which is compared.

String2 Points to a string which serves as the source for comparison.

Error Codes

The strcmp, strncmp, strcasecmp, strncasecmp, and strcoll subroutines fail if the following occurs:

EFAULT A string parameter is an invalid address. In addition, the **strcoll** subroutine fails if:

EINVAL A string parameter contains characters outside the domain of the collating sequence.

strerror Subroutine

Purpose

Maps an error number to an error message string.

Library

Standard C Library (libc.a)

Syntax

#include <string.h>

char *strerror (ErrorNumber) int ErrorNumber;

Description

Attention: Do not use the strerror subroutine in a multithreaded environment.

The **strerror** subroutine maps the error number in the *ErrorNumber* parameter to the error message string. The strerror subroutine retrieves an error message based on the current value of the LC_MESSAGES category. If the specified message catalog cannot be opened, the default message is returned. The returned message does not contain a new line ("\n").

Parameters

ErrorNumber Specifies the error number to be associated with the error message.

Return Values

The **strerror** subroutine returns a pointer to the error message.

Related Information

The **perror** subroutine.

The clearerr macro, feof macro, ferror macro, fileno macro.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

strfmon Subroutine

Purpose

Formats monetary strings.

Library

Standard C Library (libc. a)

Syntax

```
#include <monetary.h>
ssize t strfmon ( S, MaxSize, Format, ...)
char *S;
size t MaxSize;
const char *Format, ...;
```

Description

The **strfmon** subroutine converts numeric values to monetary strings according to the specifications in the Format parameter. This parameter also contains numeric values to be converted. Characters are placed into the S array, as controlled by the Format parameter. The LC MONETARY category governs the format of the conversion.

The **strfmon** subroutine can be called multiple times by including additional **format** structures, as specified by the Format parameter.

The Format parameter specifies a character string that can contain plain characters and conversion specifications. Plain characters are copied to the output stream. Conversion specifications result in the fetching of zero or more arguments, which are converted and formatted.

If there are insufficient arguments for the Format parameter, the results are undefined. If arguments remain after the Format parameter is exhausted, the excess arguments are ignored.

A conversion specification consists of the following items in the following order: a % (percent sign), optional flags, optional field width, optional left precision, optional right precision, and a required conversion character that determines the conversion to be performed.

Parameters

S Contains the output of the **strfmon** subroutine.

MaxSize Specifies the maximum number of bytes (including the null terminating byte) that may be placed in the

S parameter.

Format Contains characters and conversion specifications.

Flags

One or more of the following flags can be specified to control the conversion:

- =f An = (equal sign) followed by a single character that specifies the numeric fill character. The default numeric fill character is the space character. This flag does not affect field-width filling, which always uses the space character. This flag is ignored unless a left precision is specified.
- ^ Does not use grouping characters when formatting the currency amount. The default is to insert grouping characters if defined for the current locale.
- + or (Determines the representation of positive and negative currency amounts. Only one of these flags may be specified. The locale's equivalent of + (plus sign) and (negative sign) are used if + is specified. The locale's equivalent of enclosing negative amounts within parentheses is used if ((left parenthesis) is specified. If neither flag is included, a default specified by the current locale is used.
- Left-justifies all fields (pads to the right). The default is right-justification.
- ! Suppresses the currency symbol from the output conversion.

Field Width

W The decimal-digit string w specifies the minimum field width in which the result of the conversion is right-justified. If -w is specified, the result is left-justified. The default is a value of 0.

Left Precision

#n A # (pound sign) followed by a decimal-digit string, n, specifies the maximum number of digits to be formatted to the left of the radix character. This option can be specified to keep formatted output from multiple calls to the **strfmon** subroutine aligned in the same columns. It can also be used to fill unused positions with a special character (for example, \$***123.45). This option causes an amount to be formatted as if it has the number of digits specified by the n variable. If more than n digit positions are required, this option is ignored. Digit positions in excess of those required are filled with the numeric fill character set with the =f flag.

If defined for the current locale and not suppressed with the ^ flag, the subroutine inserts grouping characters before fill characters (if any). Grouping characters are not applied to fill characters, even if the fill character is a digit. In the example:

\$0000001,234.56

grouping characters do not appear after the first or fourth 0 from the left.

To ensure alignment, any characters appearing before or after the number in the formatted output, such as currency or sign symbols, are padded as necessary with space characters to make their positive and negative formats equal in length.

Right Precision

.p A . (period) followed by a decimal digit string, p, specifies the number of digits after the radix character. If the value of the p variable is 0, no radix character is used. If a right precision is not specified, a default specified by the current locale is use. The amount being formatted is rounded to the specified number of digits prior to formatting.

Conversion Characters

- The double argument is formatted according to the current locale's international currency format; for example, in the U.S.: 1,234.56.
- n The double argument is formatted according to the current locale's national currency format; for example, in the U.S.: \$1,234.56.
- % No argument is converted; the conversion specification %% is replaced by a single %.

Return Values

If successful, and if the number of resulting bytes (including the terminating null character) is not more than the number of bytes specified by the MaxSize parameter, the strfmon subroutine returns the number of bytes placed into the array pointed to by the S parameter (not including the terminating null byte). Otherwise, a value of -1 is returned and the contents of the S array are indeterminate.

Error Codes

The **strfmon** subroutine may fail if the following is true:

Conversion stopped due to lack of space in the buffer. E2BIG

National Language Support Overview and List of Time and Monetary Formatting Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

strftime Subroutine

Purpose

Formats time and date.

Library

Standard C Library (libc.a)

Syntax

```
#include <time.h>
size t strftime ( String, Length, Format, TmDate)
char *String;
size_t Length;
const char *Format;
const struct tm *TmDate;
```

Description

The **strftime** subroutine converts the internal time and date specification of the **tm** structure, which is pointed to by the TmDate parameter, into a character string pointed to by the String parameter under the direction of the format string pointed to by the Format parameter. The actual values for the format specifiers are dependent on the current settings for the LC TIME category. The tm structure values may be assigned by the user or generated by the **localtime** or **gmtime** subroutine. The resulting string is similar to the result of the printf Format parameter, and is placed in the memory location addressed by the String parameter. The maximum length of the string is determined by the Length parameter and terminates with a null character.

Many conversion specifications are the same as those used by the **date** command. The interpretation of some conversion specifications is dependent on the current locale of the process.

The *Format* parameter is a character string containing two types of objects: plain characters that are simply placed in the output string, and conversion specifications that convert information from the *TmDate* parameter into readable form in the output string. Each conversion specification is a sequence of this form:

% type

- A % (percent sign) introduces a conversion specification.
- The type of conversion is specified by one or two conversion characters. The characters and their meanings are:
- %a Represents the locale's abbreviated weekday name (for example, Sun) defined by the **abday** statement in the **LC_TIME** category.
- **%A** Represents the locale's full weekday name (for example, Sunday) defined by the **day** statement in the **LC_TIME** category.
- **%b** Represents the locale's abbreviated month name (for example, Jan) defined by the **abmon** statement in the **LC_TIME** category.
- **%B** Represents the locale's full month name (for example, January) defined by the **mon** statement in the **LC_TIME** category.
- %c Represents the locale's date and time format defined by the d_t_fmt statement in the LC_TIME category.
- %C Represents the century number (the year divided by 100 and truncated to an integer) as a decimal number (00 through 99).
- **%d** Represents the day of the month as a decimal number (01 to 31).
- %D Represents the date in %m/%d/%y format (for example, 01/31/91).
- **%e** Represents the day of the month as a decimal number (01 to 31). The **%e** field descriptor uses a two-digit field. If the day of the month is not a two-digit number, the leading digit is filled with a space character.
- **%E** Represents the locale's combined alternate era year and name, respectively, in **%o %N** format.
- **%h** Represents the locale's abbreviated month name (for example, Jan) defined by the **abmon** statement in the **LC_TIME** category. This field descriptor is a synonym for the **%b** field descriptor.
- **%H** Represents the 24-hour-clock hour as a decimal number (00 to 23).
- **%I** Represents the 12-hour-clock hour as a decimal number (01 to 12).
- %j Represents the day of the year as a decimal number (001 to 366).
- %k Represents the 24-hour-clock hour clock as a right-justified space-filled number (0 to 23).
- **%m** Represents the month of the year as a decimal number (01 to 12).
- **%M** Represents the minutes of the hour as a decimal number (00 to 59).
- **%n** Specifies a new-line character.
- %N Represents the locale's alternate era name.
- %o Represents the alternate era year.
- %p Represents the locale's a.m. or p.m. string defined by the am_pm statement in the LC_TIME category.
- %r Represents 12-hour clock time with a.m./p.m. notation as defined by the **t_fmt_ampm** statement. The usual format is %**l:**%**M:**%**S** %**p**.
- %R Represents 24-hour clock time in %H:%M format.
- %s Represents the number of seconds since January 1, 1970, Coordinated Universal Time (CUT).
- **%S** Represents the seconds of the minute as a decimal number (00 to 59).
- %t Specifies a tab character.
- **%T** Represents 24-hour-clock time in the format **%H:%M:%S** (for example, 16:55:15).
- **%u** Represents the weekday as a decimal number (1 to 7). Monday or its equivalent is considered the first day of the week for calculating the value of this field descriptor.
- %U Represents the week of the year as a decimal number (00 to 53). Sunday, or its equivalent as defined by the day statement in the LC_TIME category, is considered the first day of the week for calculating the value of this field descriptor.
- %V Represents the week number of the year (with Monday as the first day of the week) as a decimal number (01 to 53). If the week containing January 1 has four or more days in the new year, then it is considered week 1; otherwise, it is considered week 53 of the previous year, and the next week is week 1 of the new year.
- **%w** Represents the day of the week as a decimal number (0 to 6). Sunday, or its equivalent as defined by the **day** statement, is considered as 0 for calculating the value of this field descriptor.
- **%W** Represents the week of the year as a decimal number (00 to 53). Monday, or its equivalent as defined by the **day** statement, is considered the first day of the week for calculating the value of this field descriptor.
- **%x** Represents the locale's date format as defined by the **d_fmt** statement.

- %X Represents the locale's time format as defined by the t_fmt statement.
- %у Represents the year of the century.
 - Note: When the environment variable XPG_TIME_FMT=ON, %y is the year within the century. When a century is not otherwise specified, values in the range 69-99 refer to years in the twentieth century (1969 to 1999, inclusive); values in the range 00-68 refer to 2000 to 2068, inclusive.
- %Y Represents the year as a decimal number (for example, 1989).
- %Z Represents the time-zone name if one can be determined (for example, EST). No characters are displayed if a time zone cannot be determined.
- %% Specifies a % (percent sign).

Some conversion specifiers can be modified by the E or O modifier characters to indicate that an alternative format or specification should be used. If the alternative format or specification does not exist for the current locale, the behavior will be the same as with the unmodified conversion specification. The following modified conversion specifiers are supported:

- %Ec Represents the locale's alternative appropriate date and time as defined by the era d t fmt statement.
- %EC Represents the name of the base year (or other time period) in the locale's alternative form as defined by the **era** statement under the **era_name** category of the current era.
- **%Ex** Represents the locale's alternative date as defined by the **era_d fmt** statement.
- **%EX** Represents the locale's alternative time as defined by the **era t fmt** statement.
- **%Ey** Represents the offset from the **%EC** modified conversion specifier (year only) in the locale's alternative form.
- **%EY** Represents the full alternative-year form.
- **%Od** Represents the day of the month, using the locale's alternative numeric symbols, filled as needed with leading 0's if an alternative symbol for 0 exists. If an alternative symbol for 0 does not exist, the %Od modified conversion specifier uses leading space characters.
- **%Oe** Represents the day of the month, using the locale's alternative numeric symbols, filled as needed with leading 0's if an alternative symbol for 0 exists. If an alternative symbol for 0 does not exist, the %Oe modified conversion specifier uses leading space characters.
- **%OH** Represents the hour in 24-hour clock time, using the locale's alternative numeric symbols.
- **%0I** Represents the hour in 12-hour clock time, using the locale's alternative numeric symbols.
- **%Om** Represents the month, using the locale's alternative numeric symbols.
- **%OM** Represents the minutes, using the locale's alternative numeric symbols.
- **%OS** Represents the seconds, using the locale's alternative numeric symbols.
- **%Ou** Represents the weekday as a number using the locale's alternative numeric symbols.
- **%OU** Represents the week number of the year, using the locale's alternative numeric symbols. Sunday is considered the first day of the week. Use the rules corresponding to the %U conversion specifier.
- %OV Represents the week number of the year (Monday as the first day of the week, rules corresponding to %V) using the locale's alternative numeric symbols.
- %Ow Represents the number of the weekday (with Sunday equal to 0), using the locale's alternative numeric symbols.
- %OW Represents the week number of the year using the locale's alternative numeric symbols. Monday is considered the first day of the week. Use the rules corresponding to the %W conversion specifier.
- **%Oy** Represents the year (offset from %C) using the locale's alternative numeric symbols.

Parameters

String Points to the string to hold the formatted time.

Length Specifies the maximum length of the string pointed to by the *String* parameter.

Format Points to the format character string.

TmDate Points to the time structure that is to be converted.

Return Values

If the total number of resulting bytes, including the terminating null byte, is not more than the Length value, the strftime subroutine returns the number of bytes placed into the array pointed to by the String parameter, not including the terminating null byte. Otherwise, a value of 0 is returned and the contents of the array are indeterminate.

char **String1;
const char *String2;
char *index (String, Character)
const char *String;
int Character;
char *rindex (String, Character)
const char *String;
int Character;
```

Description

Attention: Do not use the strtok subroutine in a multithreaded environment. Use the strtok r subroutine instead.

The strlen, strrchr, strrchr, strpbrk, strspn, strcspn, strstr, and strtok subroutines determine such values as size, location, and the existence of strings in memory.

The String1, String2, and String parameters point to strings. A string is an array of characters terminated by a null character.

The **strlen** subroutine returns the number of bytes in the string pointed to by the *String* parameter, not including the terminating null bytes.

The **strchr** subroutine returns a pointer to the first occurrence of the character specified by the *Character* (converted to an unsigned character) parameter in the string pointed to by the String parameter. A null pointer is returned if the character does not occur in the string. The null byte that terminates a string is considered to be part of the string.

The **strrchr** subroutine returns a pointer to the last occurrence of the character specified by the *Character* (converted to a character) parameter in the string pointed to by the String parameter. A null pointer is returned if the character does not occur in the string. The null byte that terminates a string is considered to be part of the string.

The **strpbrk** subroutine returns a pointer to the first occurrence in the string pointed to by the *String1* parameter of any bytes from the string pointed to by the String2 parameter. A null pointer is returned if no bytes match.

The **strspn** subroutine returns the length of the initial segment of the string pointed to by the *String1* parameter, which consists entirely of bytes from the string pointed to by the String2 parameter.

The **strcspn** subroutine returns the length of the initial segment of the string pointed to by the *String1* parameter, which consists entirely of bytes not from the string pointed to by the String2 parameter.

The strstr subroutine finds the first occurrence in the string pointed to by the String1 parameter of the sequence of bytes specified by the string pointed to by the String2 parameter (excluding the terminating null character). It returns a pointer to the string found in the String1 parameter, or a null pointer if the string was not found. If the String2 parameter points to a string of 0 length, the strstr subroutine returns the value of the String1 parameter.

The **strtok** subroutine breaks the string pointed to by the *String1* parameter into a sequence of tokens, each of which is delimited by a byte from the string pointed to by the String2 parameter. The first call in the sequence takes the String1 parameter as its first argument and is followed by calls that take a null pointer as their first argument. The separator string pointed to by the String2 parameter may be different from call to call.

The first call in the sequence searches the String1 parameter for the first byte that is not contained in the current separator string pointed to by the String2 parameter. If no such byte is found, no tokens exist in the string pointed to by the String1 parameter, and a null pointer is returned. If such a byte is found, it is the start of the first token.

The **strtok** subroutine then searches from the first token for a byte that is contained in the current separator string. If no such byte is found, the current token extends to the end of the string pointed to by the String1 parameter, and subsequent searches for a token return a null pointer. If such a byte is found, the strtok subroutine overwrites it with a null byte, which terminates the current token. The strtok subroutine saves a pointer to the following byte, from which the next search for a token will start. The subroutine returns a pointer to the first byte of the token.

Each subsequent call with a null pointer as the value of the first argument starts searching from the saved pointer, using it as the first token. Otherwise, the subroutine's behavior does not change.

The **strsep** subroutine returns the next token from the string *String1* which is delimited by *String2*. The token is terminated with a \0 character and String1 is updated to point past the token. The strsep subroutine returns a pointer to the token, or NULL if String2 is not found in String1.

The index, rindex and strsep subroutines are included for compatibility with BSD and are not part of the ANSI C Library. The index subroutine is implemented as a call to the strchr subroutine. The rindex subroutine is implemented as a call to the **strrchr** subroutine.

Parameters

Character Specifies a character for which to return a pointer. Points to a string from which data is returned. Strina

Strina1 Points to a string from which an operation returns results. Points to a string which contains source for an operation. String2

Error Codes

The strlen, strrchr, strrchr, strpbrk, strspn, strcspn, strstr, and strtok subroutines fail if the following occurs:

EFAULT A string parameter is an invalid address.

strncollen Subroutine

Purpose

Returns the number of collation values for a given string.

Library

Standard C Library (libc.a)

Syntax

include <string.h>

int strncollen (String, Number) const char *String; const int Number;

Description

The **strncollen** subroutine returns the number of collation values for a given string pointed to by the *String* parameter. The count of collation values is terminated when either a null character is encountered or when the number of bytes indicated by the *Number* parameter have been examined.

The collation values are set by the **setlocale** subroutine for the **LC COLLATE** category. For example, if the locale is set to Es_ES (Spanish spoken in Spain) for the LC_COLLATE category, where 'ch' has one collation value, then strncollen ('abchd', 5) returns 4.

In German, the <Sharp-S> character has two collation values, so substituting the <Sharp-S> character for B in the following example, **strncollen** ('straBa', 6) returns 7.

If a character has no collation value, its collation length is 0.

Parameters

Number The number of bytes in a string to be examined. String Pointer to a string to be examined for collation value.

Return Values

Upon successful completion, the **strncollen** subroutine returns the collation value for a given string, pointed to by the String parameter.

National Language Support Overview in AIX 5L Version 5.3 National Language Support Guide and Reference.

strtod32, strtod64, or strtod128 Subroutine

Purpose

Converts a string to a decimal floating-point number.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
Decimal32 strtod32 (nptr, endptr)
const char *nptr;
char **endptr;
_Decimal64 strtod64 (nptr, endptr)
const char *nptr;
char **endptr;
Decimal 128 strtod 128 (nptr, endptr)
const char *nptr;
char **endptr;
```

Description

The strtod32, strtod64, and strtod128 subroutines convert the initial portion of the string pointed to by the nptr parameter to _Decimal32, _Decimal64, and _Decimal128 representation, respectively. First, these subroutines decompose the input string into three parts:

- An initial and possibly empty sequence of white-space characters (as specified by the isspace subroutine).
- A subject sequence interpreted as a floating-point constant or representing infinity or NaN.
- · A final string of one or more unrecognized characters, including the terminating null byte of the input string.

Then, the strtod32, strtod64, and strtod128 subroutines attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign and one of the following:

- · A non-empty sequence of decimal digits optionally containing a radix character and an optional exponent part
- One of INF or INFINITY, or any other string equivalent except for case
- One of NAN or NAN (*n-char-sequence* opt), ignoring case in the NAN, where:

```
n-char-sequence:
              digit
              n-char-sequence digit
```

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence contains no characters if the input wide string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the radix character (whichever occurs first) are interpreted as a floating constant according to the rules of the C language, except that it is not a hexadecimal floating number or the radix character is used in place of a period. If neither an exponent part nor a radix character appears in a decimal floating-point number, an exponent part of the appropriate type with value 0 is assumed to follow the last digit in the string.

If the subject sequence begins with a minus sign, the sequence is interpreted as negated. A character sequence INF or INFINITY is interpreted as infinity. A character sequence NAN or NAN (n-char-sequence opt) is interpreted as a quiet NaN. The meaning of the n-char sequences is implementation-defined. A pointer to the final string is stored in the object pointed to by the endptr parameter, provided that the endptr parameter is not a null pointer.

The radix character is as defined in the locale of the program (category LC_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the radix character defaults to a period.

In locales other than the C or POSIX locale, other implementation-defined subject sequences can be accepted.

If the subject sequence is empty or does not have the expected form, no conversion is performed. The value of the nptr parameter is stored in the object pointed to by the endptr parameter, provided that the endptr parameter is not a null pointer.

The strtod32, strtod64, and strtod128 subroutines do not change the setting of the errno global variable if successful.

The value of 0 is returned on error and is also a valid return on success. Therefore, an application checking for error situations should set the value of the errno global variable to 0, call the strtod32, strtod64, or strto128 subroutine, and check the errno global variable.

Parameters

nptr	Contains a pointer to the string to be converted to a decimal floating point value.
endpr	Contains a pointer to the position in the string specified by the <i>nptr</i> parameter where a
	character is found that is not a valid character for the conversion

Return Values

Upon successful completion, the strtod32, strtod64, and strtod128 subroutines return the converted value. If no conversion can be performed, the value of 0 is returned and the errno global variable might be set to EINVAL.

If the correct value is outside the range of representable values, ±HUGE VAL D32, ±HUGE VAL D64, or **±HUGE VAL D128** is returned (according to the return type and sign of the value), and the **errno** global variable is set to **ERANGE**.

If the correct value causes underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type is returned, and the errno global variable is set to ERANGE.

The scanf, fscanf, sscanf, or wsscanf subroutine; the setlocale subroutine; the strtol, strtoll, strtoll, strtoull, or atoi subroutine; the wcstod32, wcstod64 or wcstod128 subroutine.

The ctype, isalpha, isupper, islower, isdigit, isxdigit, isalnum, isspace, ispunct, isprint, isgraph, iscntrl, or isascii subroutine; the localeconv subroutine in the AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

strtof, strtod, or strtold Subroutine

Purpose

Converts a string to a double-precision number.

Syntax

```
#include <stdlib.h>
float strtof (nptr, endptr)
const char *restrict nptr;
char **restrict endptr;
double strtod ( nptr, endptr)
const char *nptr
char**endptr;
long double strtold (nptr, endptr)
const char *restrict nptr;
char **restrict endptr;
```

Description

The **strtof**, **strtod**, and **strtold** subroutines convert the initial portion of the string pointed to by *nptr* to double, float, and long double representation, respectively. First, they decompose the input string into three parts:

- An initial, possibly empty, sequence of white-space characters (as specified by isspace()).
- A subject sequence interpreted as a floating-point constant or representing infinity or NaN.
- A final string of one or more unrecognized characters, including the terminating null byte of the input string.

Then, they attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign, and one of the following:

- · A non-empty sequence of decimal digits optionally containing a radix character, and an optional exponent part
- A 0x or 0X, and a non-empty sequence of hexadecimal digits optionally containing a radix character, and an optional binary exponent part
- One of INF or INFINITY, ignoring case
- One of NAN or NAN(n-char-sequence opt), ignoring case in the NAN part, where:

```
n-char-sequence:
  digit
  nondigit
 n-char-sequence digit
 n-char-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) are interpreted as a floating constant of the C language, except that the radix character is used in place of a period, and if neither an exponent part nor a radix character appears in a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string.

If the subject sequence begins with a minus sign, the sequence is interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type, or else as if it were a floating constant that is too large for the range of the return type. A character sequence NAN or NAN(n-char-sequence opt) is interpreted as a quiet NaN, if supported in the return type, or else as if it were a subject sequence part that does not have the expected form. The meaning of the *n*-char

sequences is implementation-defined. A pointer to the final string is stored in the object pointed to by the endptr parameter, provided that the endptr parameter is not a null pointer.

If the subject sequence has the hexadecimal form, the value resulting from the conversion is correctly rounded.

The radix character is defined in the program's locale (category LC_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the radix character defaults to a period.

In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of **str** is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

The **strtod** subroutine does not change the setting of the **errno** global variable if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set errno to 0, call the strtof or strtold subroutine, then check errno.

Parameters

nptr Specifies the string to be converted.

endptr Points to the final string.

Return Values

Upon successful completion, the strtof and strtold subroutines return the converted value. If no conversion could be performed, 0 is returned, and the errno global variable may be set to EINVAL.

If the correct value is outside the range of representable values, HUGE_VAL, HUGE_VALF, or **HUGE_VALL** is returned (according to the sign of the value), and **errno** is set to ERANGE.

If the correct value would cause an underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type is returned and the **errno** global variable is set to ERANGE.

Error Codes

Note: Because a value of 0 can indicate either an error or a valid result, an application that checks for errors with the strtod, strtof, and strtold subroutines should set the errno global variable equal to 0 prior to the subroutine call. The application can check the errno global variable after the subroutine call.

If the string pointed to by NumberPointer is empty or begins with an unrecognized character, a value of 0 is returned for the **strtod**, **strtof**, and **strtold** subroutines.

If the conversion cannot be performed, a value of 0 is returned, and the errno global variable is set to indicate the error.

If the conversion causes an overflow (that is, the value is outside the range of representable values), +/-**HUGE VAL** is returned with the sign indicating the direction of the overflow, and the **errno** global variable is set to **ERANGE**.

If the conversion would cause an underflow, a properly signed value of 0 is returned and the errno global variable is set to **ERANGE**.

For the **strtod**, **strtof**, and **strtold** subroutines, if the value of the *EndPointer* parameter is not (**char****) NULL, a pointer to the character that stopped the subroutine is stored in *EndPointer. If a floating-point value cannot be formed, *EndPointer is set to NumberPointer.

The **strtof** subroutine has only one rounding error. (If the **strtod** subroutine is used to create a double-precision floating-point number and then that double-precision number is converted to a floating-point number, two rounding errors could occur.)

strtoimax or strtoumax Subroutine

Purpose

Converts string to integer type.

Syntax

```
#include <inttypes.h>
intmax t strtoimax (nptr, endptr, base)
const char *restrict nptr;
char **restrict endptr;
int base;
uintmax_t strtoumax (nptr, endptr, base)
const char *restrict nptr;
char **restrict endptr;
int base;
```

Description

The strtoimax and strtoumax subroutines are equivalent to the strtol, strtoll, strtoul, and strtoull subroutines, except that the initial portion of the string shall be converted to intmax_t and uintmax_t representation, respectively.

Parameters

nptr Points to the string to be converted.

endptr Points to the object where the final string is stored.

Determines the value of the integer represented in some radix. base

Return Values

The **strtoimax** and **strtoumax** subroutines return the converted value, if any.

If no conversion could be performed, zero is returned.

If the correct value is outside the range of representable values, {INTMAX_MAX}, {INTMAX_MIN}, or {UINTMAX_MAX} is returned (according to the return type and sign of the value, if any), and the errno global variable is set to ERANGE.

Related Information

The "strtol, strtoul, strtoll, strtoull, or atoi Subroutine" on page 353.

inttypes.h in AIX 5L Version 5.3 Files Reference.

strtok r Subroutine

Purpose

Breaks a string into a sequence of tokens.

Libraries

Thread-Safe C Library (libc_r.a)

Syntax

```
#include<string.h>
char *strtok r (String, Separators, Pointer);
char *String;
const char *Separators;
char **Pointer;
```

Description

Note: The **strtok_r** subroutine is used in a multithreaded environment.

The **strtok_r** subroutine breaks the string pointed to by the *String* parameter into a sequence of tokens, each of which is delimited by a byte from the string pointed to by the Separators parameter. The Pointer parameter holds the information necessary for the **strtok** r subroutine to perform scanning on the *String* parameter. In the first call to the **strtok** r subroutine, the value passed as the *Pointer* parameter is ignored.

The first call in the sequence searches the *String* parameter for the first byte that is not contained in the current separator string pointed to by the Separators parameter. If no such byte is found, no tokens exist in the String parameter, and a null pointer is returned. If such a byte is found, it is the start of the first token. The **strtok** r subroutine also updates the *Pointer* parameter with the starting address of the token following the first occurrence of the Separators parameter.

In subsequent calls, a null pointer should be passed as the first parameter to the strtok r subroutine instead of the String parameter. Each subsequent call with a null pointer as the value of the first argument starts searching from the *Pointer* parameter, using it as the first token. Otherwise, the subroutine's behavior does not change. The **strtok_r** subroutine would return successive tokens until no tokens remain. The Separators parameter may be different from one call to another.

Parameters

String Separators Pointer

Points to a string from which an operation returns results. Points to a string which contains source for an operation. Points to a user provided pointer.

Error Codes

The **strtok r** subroutine fails if the following occurs:

EFAULT

A String parameter is an invalid address.

Related Information

The "strlen, strchr, strrchr, strpbrk, strspn, strcspn, strstr, strtok, or strsep Subroutine" on page 343.

Writing Reentrant and Thread-Safe Code in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

strtol, strtoul, strtoll, strtoull, or atoi Subroutine

Purpose

Converts a string to a signed or unsigned long integer or long long integer.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
long strtol ( String, EndPointer, Base)
const char *String;
char **EndPointer;
int Base;
unsigned long strtoul (String, EndPointer, Base)
const char *String;
char **EndPointer;
int Base;
long long int strtoll (String, EndPointer, Base)
char *String, **EndPointer;
int Base;
unsigned long long int strtoull (String, EndPointer, Base)
char *String, **EndPointer;
int Base;
int atoi (String)
const char *String;
```

Description

The strtol subroutine returns a long integer whose value is represented by the character string to which the String parameter points. The strtol subroutine scans the string up to the first character that is inconsistent with the Base parameter. Leading white-space characters are ignored, and an optional sign may precede the digits.

The **strtoul** subroutine provides the same functions but returns an unsigned long integer.

The **strtoll** and **strtoull** subroutines provide the same functions but return long long and unsigned long long integers, respectively.

The atoi subroutine is equivalent to the strtol subroutine where the value of the EndPointer parameter is a null pointer and the Base parameter is a value of 10.

If the value of the EndPointer parameter is not null, then a pointer to the character that ended the scan is stored in EndPointer. If an integer cannot be formed, the value of the EndPointer parameter is set to that of the String parameter.

If the Base parameter is a value between 2 and 36, the subject sequence's expected form is a sequence of letters and digits representing an integer whose radix is specified by the Base parameter. This sequence is optionally preceded by a + (positive) or - (negative) sign. Letters from a (or A) to z (or Z) inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of the Base parameter are permitted. If the Base parameter has a value of 16, the characters 0x or 0X optionally precede the sequence of letters and digits, following the + (positive) or - (negative) sign if present.

If the value of the Base parameter is 0, the string determines the base. Thus, after an optional leading sign, a leading 0 indicates octal conversion, and a leading 0x or 0X indicates hexadecimal conversion. The default is to use decimal conversion.

Parameters

String Points to the character string to be converted.

EndPointer Points to a character string that contains the first character not converted.

Base Specifies the base to use for the conversion.

Return Values

Upon successful completion, the strtol, strtoll, strtoll, and strtoll subroutines return the converted value. If no conversion could be performed, 0 is returned, and the errno global variable is set to indicate the error. If the correct value is outside the range of representable values, the strtol subroutine returns a value of LONG MAX or LONG MIN according to the sign of the value, while the strtoul subroutine returns a value of **ULONG_MAX**. The **strtoll** subroutine returns a value of **LLONG_MAX** or **LLONG_MIN**, according to the sign of the value. The strtoul subroutine returns a value of ULONG MAX, and the strtoull subroutine returns a value of ULLONG_MAX.

Error Codes

The **strtol** and **strtoul** subroutines return the following error codes:

ERANGE The correct value of the converted number causes underflow or overflow.

EINVAL The value of the Base parameter is not valid.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

strptime Subroutine

Purpose

Converts a character string to a time value.

Library

Standard C Library (libc.a)

Syntax

#include <time.h>

```
char *strptime ( Buf, Format, Tm)
const char *Buf, *Format;
struct tm *Tm;
```

Description

The **strptime** subroutine converts the characters in the *Buf* parameter to values that are stored in the *Tm* structure, using the format specified by the Format parameter.

Parameters

Buf

Contains the character string to be converted by the **strptime** subroutine.

Format

Contains format specifiers for the strptime subroutine. The Format parameter contains 0 or more specifiers. Each specifier is composed of one of the following elements:

- · One or more white-space characters
- An ordinary character (neither % [percent sign] nor a white-space character)
- · A format specifier

Note: If more than one format specifier is present, they must be separated by white space or a non-percent/non-alphanumeric character. If the seperator between format specifiers is other than white space, the Buf string should hold the same seperator at the corresponding locations.

The LC TIME category defines the locale values for the format specifiers. The following format specifiers are supported:

- %a Represents the weekday name, either abbreviated as specified by the abday statement or full as specified by the day statement.
- Represents the weekday name, either abbreviated as specified by the abday statement or full as specified by %A the **day** statement.
- %b Represents the month name, either abbreviated as specified by the abmon statement or full as specified by the **month** statement.
- %B Represents the month name, either abbreviated as specified by the abmon statement or full as specified by the **month** statement.
- %с Represents the date and time format defined by the d_t_fmt statement in the LC_TIME category.
- Represents the century number (0 through 99); leading zeros are permitted but not required. %C
- %d Represents the day of the month as a decimal number (01 to 31).
- %D Represents the date in %m/%d/%y format (for example, 01/31/91).
- %e Represents the day of the month as a decimal number (01 to 31).
- %Е Represents the combined alternate era year and name, respectively, in %o %N format.
- Represents the month name, either abbreviated as specified by the abmon statement or full as specified by %h the month statement.
- %Н Represents the 24-hour-clock hour as a decimal number (00 to 23).
- %l Represents the 12-hour-clock hour as a decimal number (01 to 12).
- %i Represents the day of the year as a decimal number (001 to 366).
- Represents the month of the year as a decimal number (01 to 12). %m
- %M Represents the minutes of the hour as a decimal number (00 to 59).
- %n Represents any white space.
- Represents the alternate era name. %N
- **%o** Represents the alternate era year.
- Represents the a.m. or p.m. string defined by the am pm statement in the LC TIME category. %p
- %r Represents 12-hour-clock time with a.m./p.m. notation as defined by the t_fmt_ampm statement, usually in the format %I:%M:%S %p.
- Represents the seconds of the minute as a decimal number (00 to 61). The decimal number range of 00 to 61 %S provides for leap seconds.
- %t Represents any white space.
- %T Represents 24-hour-clock time in the format %H:%M:%S (for example, 16:55:15).

- Represents the week of the year as a decimal number (00 to 53). Sunday, or its equivalent as defined by the %U day statement, is considered the first day of the week for calculating the value of this field descriptor.
- Represents the day of the week as a decimal number (0 to 6). Sunday, or its equivalent as defined by the day %w statement in the LC TIME category, is considered to be 0 for calculating the value of this field descriptor.
- Represents the week of the year as a decimal number (00 to 53). Monday, or its equivalent as defined by the %W day statement in the LC_TIME category, is considered the first day of the week for calculating the value of this field descriptor.
- %x Represents the date format defined by the **d_fmt** statement in the **LC_TIME** category.
- %X Represents the time format defined by the t_fmt statement in the LC_TIME category.
- %у Represents the year within century.
 - Note: When the environment variable XPG_TIME_FMT=ON, %y is the year within the century. When a century is not otherwise specified, values in the range 69-99 refer to years in the twentieth century (1969 to 1999, inclusive); values in the range 00-68 refer to 2000 to 2068, inclusive.
- %Y Represents the year as a decimal number (for example, 1989).
- %Z Represents the time-zone name, if one can be determined (for example, EST). No characters are displayed if a time zone cannot be determined.
- Specifies a % (percent sign) character. %%

Some format specifiers can be modified by the E and O modifier characters to indicate an alternative format or specification. If the alternative format or specification does not exist in the current locale, the behavior will be as if the unmodified format specifier were used. The following modified format specifiers are supported:

- **%Ec** Represents the locale's alternative appropriate date and time as defined by the **era_d_t_fmt** statement.
- %EC Represents the base year (or other time period) in the locale's alternative form as defined by the era statement under the **era_name** category of the current era.
- **%Ex** Represents the alternative date as defined by the **era_d_fmt** statement.
- **%EX** Represents the locale's alternative time as defined by the **era t fmt** statement.
- **%Ey** Represents the offset from the **%EC** format specifier (year only) in the locale's alternative form.
- %EY Represents the full alternative-year format.
- %Od Represents the month using the locale's alternative numeric symbols. Leading 0's are permitted but not required.
- %Oe Represents the month using the locale's alternative numeric symbols. Leading 0's are permitted but not required.
- **%OH** Represents the hour in 24-hour-clock time using the locale's alternative numeric symbols.
- **%OI** Represents the hour in 12-hour-clock time using the locale's alternative numeric symbols.
- **%Om** Represents the month using the locale's alternative numeric symbols.
- **%OM** Represents the minutes using the locale's alternative numeric symbols.
- **%OS** Represents the seconds using the locale's alternative numeric symbols.
- **%OU** Represents the week number of the year using the locale's alternative numeric symbols. Sunday is considered the first day of the week. Use the rules corresponding to the %U format specifier.
- **%Ow** Represents the day of the week using the locale's alternative numeric symbols. Sunday is considered the first day of the week.
- %OW Represents the week number of the year using the locale's alternative numeric symbols. Monday is considered the first day of the week. Use the rules corresponding to the %W format specifier.
- **%Oy** Represents the year (offset from %C) using the locale's alternative numeric symbols.

A format specification consisting of white-space characters is performed by reading input until the first nonwhite-space character (which is not read) or up to no more characters can be read.

A format specification consisting of an ordinary character is performed by reading the next character from the Buf parameter. If this character differs from the character comprising the directive, the directive fails and the differing character and any characters following it remain unread. Case is ignored when matching Buf items, such as month or weekday names.

A series of directives composed of %n format specifiers, %t format specifiers, white-space characters, or any combination of the three items is processed by reading up to the first character that is not white space (which remains unread), or until no more characters can be read.

Tm Specifies the structure to contain the output of the strptime subroutine. If a conversion fails, the contents of the *Tm* structure are undefined.

Return Values

If successful, the **strptime** subroutine returns a pointer to the character following the last character parsed. Otherwise, a null pointer is returned.

National Language Support Overview and List of Time and Monetary Formatting Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

stty or gtty Subroutine

Purpose

Sets or gets terminal state.

Library

Standard C Library (libc.a)

Syntax

#include <sgtty.h> **stty** (FileDescriptor, Buffer)

int FileDescriptor; struct sgttyb *Buffer; gtty (FileDescriptor, Buffer) int FileDescriptor; struct sgttyb *Buffer;

Description

These subroutines have been made obsolete by the ioctl subroutine.

The **stty** subroutine sets the state of the terminal associated with the *FileDescriptor* parameter. The **gtty** subroutine retrieves the state of the terminal associated with FileDescriptor. To set the state of a terminal, the calling process must have write permission.

Use of the stty subroutine is equivalent to the ioctl (FileDescriptor, TIOSETP, Buffer) subroutine, while use of the **gtty** subroutine is equivalent to the **ioctl** (*FileDescriptor*, TIOGETP, *Buffer*) subroutine.

Parameters

FileDescriptor Specifies an open file descriptor.

Buffer Specifies the buffer.

Return Values

If the stty or gtty subroutine is successful, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Related Information

The **ioctl** subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

swab Subroutine

Purpose

Copies bytes.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>

void swab (From, To, NumberOfBytes) const void *From; void *To: ssize_t NumberOfBytes;

Description

The **swab** subroutine copies the number of bytes pointed to by the *NumberOfBytes* parameter from the location pointed to by the *From* parameter to the array pointed to by the *To* parameter, exchanging adjacent even and odd bytes.

The NumberOfBytes parameter should be even and nonnegative. If the NumberOfBytes parameter is odd and positive, the **swab** subroutine uses *NumberOfBytes* -1 instead. If the *NumberOfBytes* parameter is negative, the swab subroutine does nothing.

Parameters

From Points to the location of data to be copied.

То Points to the array to which the data is to be copied.

NumberOfBytes Specifies the number of even and nonnegative bytes to be copied.

Related Information

The memccpy, memchr, memcmp, memmove, or memset subroutine, string ("strlen, strchr, strrchr, strpbrk, strspn, strcspn, strstr, strtok, or strsep Subroutine" on page 343) subroutine.

Input and output redirection in Operating system and device management.

Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

swapoff Subroutine

Purpose

Deactivates paging or swapping to a designated block device.

Library

Standard C Library (libc.a)

Syntax

int swapoff (PathName) char *PathName;

Description

The swapoff subroutine deactivates a block device or logical volume that is actively being used for paging and swapping. There must be sufficient space to satisfy the system's paging space requirements in the remaining devices after this device is deactivated or swapoff will fail. Sufficient space must accommodate the current system-wide paging space usage and the npswarn value. Refer to the swap command for information on current system-wide paging space usage. Refer to the **npswarn** tunable parameter of the vmo command, and Values for the npswarn and npskill paramaters for information on the npswarn value.

Parameters

PathName Specifies the full path name of the block device or logical volume.

Error Codes

If an error occurs, the **errno** global variable is set to indicate the error:

EBUSY The deactivation is already running.

EINTR The signal was received during the processing of a request.

ENODEV The PathName file does not exist.

No memory is available. **ENOMEM**

ENOSPC There is not enough space in other paging spaces to satisfy the system's requirements.

ENOTBLK The device must be a block device or logical volume. A component of the PathName prefix is not a directory. ENOTDIR

EPERM Caller does not have proper authority.

Other errors are from calls to the device driver's open subroutine or ioctl subroutine.

Related Information

The **swapoff** command, **vmo** command.

Values for the npswarn and npskill paramaters.

The Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

swapon Subroutine

Purpose

Activates paging or swapping to a designated block device.

Library

Standard C Library (libc.a)

Syntax

#include <sys/vminfo.h>

int swapon (PathName)
char *PathName;

Description

The **swapon** subroutine makes the designated block device available to the system for allocation for paging and swapping.

The specified block device must be a logical volume on a disk device. The paging space size is determined from the current size of the logical volume.

Parameters

PathName Specifies the full path name of the block device.

Error Codes

If an error occurs, the errno global variable is set to indicate the error:

EINTR Signal was received during processing of a request.

EINVAL Invalid argument (size of device is invalid).

ENOENT The *PathName* file does not exist.

ENOMEM The maximum number of paging space devices (16) are already defined, or no memory is available.

ENOTBLK Block device required.

ENOTDIR A component of the *PathName* prefix is not a directory.

ENXIO No such device address.

Other errors are from calls to the device driver's open subroutine or ioctl subroutine.

Related Information

The **swapoff** subroutine, **swapqry** subroutine.

The swapoff command, swapon command.

The Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

swapqry Subroutine

Purpose

Returns paging device status.

Library

Standard C Library (libc.a)

Syntax

#include <sys/vminfo.h>

int swapqry (PathName, Buffer) char *PathName; struct pginfo *Buffer;

Description

The **swapqry** subroutine returns information to a user-designated buffer about active paging and swap devices.

Parameters

PathName Specifies the full path name of the block device. Points to the buffer into which the status is stored. Buffer

Return Values

The **swapqry** subroutine returns 0 if the *PathName* value is an active paging device. If the *Buffer* value is not null, it also returns status information.

Error Codes

If an error occurs, the subroutine returns -1 and the errno global variable is set to indicate the error, as follows:

EFAULT Buffer pointer is invalid. EINVAL Invalid argument.

EINTR Signal was received while processing request.

ENODEV Device is not an active paging device. ENOENT The PathName file does not exist.

ENOTBLK Block device required.

ENOTDIR A component of the *PathName* prefix is not a directory.

ENXIO No such device address.

Related Information

Subroutines Overview and Understanding Paging Space Programming Requirements in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

symlink Subroutine

Purpose

Makes a symbolic link to a file.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
int symlink ( Path1, Path2)
const char *Path1;
const char *Path2;
```

Description

The **symlink** subroutine creates a symbolic link with the file named by the *Path2* parameter, which refers to the file named by the Path1 parameter.

As with a hard link (described in the link subroutine), a symbolic link allows a file to have multiple names. The presence of a hard link guarantees the existence of a file, even after the original name has been removed. A symbolic link provides no such assurance. In fact, the file named by the Path1 parameter need not exist when the link is created. In addition, a symbolic link can cross file system boundaries.

When a component of a path name refers to a symbolic link rather than a directory, the path name contained in the symbolic link is resolved. If the path name in the symbolic link starts with a / (slash), it is resolved relative to the root directory of the process. If the path name in the symbolic link does not start with / (slash), it is resolved relative to the directory that contains the symbolic link.

If the symbolic link is not the last component of the original path name, remaining components of the original path name are resolved from the symbolic-link point.

If the last component of the path name supplied to a subroutine refers to a symbolic link, the symbolic link path name may or may not be traversed. Most subroutines always traverse the link; for example, the chmod, chown, link, and open subroutines. The statx subroutine takes an argument that determines whether the link is to be traversed.

The following subroutines refer only to the symbolic link itself, rather than to the object to which the link refers:

1010101	
mkdir	
	Fails with the EEXIST error code if the target is a symbolic link.
mknod	
	Fails with the EEXIST error code if a symbolic link exists with the same name as the target file as specified by the <i>Path</i> parameter in the mknod and mkfifo subroutines.
open	
	Fails with EEXIST error code when the O_CREAT and O_EXCL flags are specified and a symbolic link exists for the path name specified.
readlink ("readlink Subroutine" on page 38)	
	Applies only to symbolic links.
rename ("rename Subroutine" on page 59)	
	Renames the symbolic link if the file to be renamed (the <i>FromPath</i> parameter for the rename subroutine) is a symbolic link. If the new

name (the *ToPath* parameter for the **rename** subroutine) refers to

Fails with the **ENOTDIR** error code if the target is a symbolic link.

an existing symbolic link, the symbolic link is destroyed.

rmdir ("rmdir Subroutine" on page 64)

symlink Running this subroutine causes an error if a symbolic link named by

the *Path2* parameter already exists. A symbolic link can be created that refers to another symbolic link; that is, the *Path1* parameter can

refer to a symbolic link.

unlink ("unlink Subroutine" on page 495)

Removes the symbolic link.

Since the mode of a symbolic link cannot be changed, its mode is ignored during the lookup process. Any files and directories referenced by a symbolic link are checked for access normally.

Parameters

Path1 Specifies the contents of the Path2 symbolic link. This value is a null-terminated string representing the

object to which the symbolic link will point. Path1 cannot be the null value and cannot be more than

PATH_MAX characters long. PATH_MAX is defined in the limits.h file.

Path2 Names the symbolic link to be created.

Return Values

Upon successful completion, the **symlink** subroutine returns a value of 0. If the **symlink** subroutine fails, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **symlink** subroutine fails if one or more of the following are true:

EEXIST Path2 already exists.

EACCES The requested operation requires writing in a directory with a mode that denies write permission.

EROFS The requested operation requires writing in a directory on a read-only file system.

ENOSPC The directory in which the entry for the symbolic link is being placed cannot be extended because there

is no space left on the file system containing the directory.

EDQUOT The directory in which the entry for the new symbolic link is being placed cannot be extended or disk

blocks could not be allocated for the symbolic link because the user's or group's quota of disk blocks on

the file system containing the directory has been exhausted.

The **symlink** subroutine can be unsuccessful for other reasons. See "Base Operating System Error Codes For Services That Require Path-Name Resolution" for a list of additional errors.

Related Information

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sync Subroutine

Purpose

Updates all file systems.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>
void sync ()

Description

The **sync** subroutine causes all information in memory that should be on disk to be written out. The writing, although scheduled, is not necessarily complete upon return from this subroutine. Types of information to be written include modified superblocks, i-nodes, data blocks, and indirect blocks.

The **sync** subroutine should be used by programs that examine a file system, such as the **df** and **fsck** commands.

If Network File System (NFS) is installed on your system, information in memory that relates to remote files is scheduled to be sent to the remote node.

Related Information

The **fsync** subroutine.

The **df** command, **sync** command.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

syncvfs Subroutine

Purpose

Updates a filesystem.

Syntax

#include <fscntl.h>

int syncvfs (vfsName, command)
char *vfsName;
int command;

Description

The **syncvfs** subroutine behaves in 3 different manners depending on the granularity specified. In each case the **GFS_SYNCVFS** flag is checked and **VFS_SYNCVFS** or **VFS_SYNC** is called on the GFS and/or VFS specified. In each case the the *command* parameter is passed untouched. The cases are:

• If a NULL pointer is passed through the *vfsName* parameter, the **FS_SYNCVFS_ALL** level is assumed, and the call loops through each GFS in a similar manner to the sync call.

- If FS_SYNCVFS_FSTYPE is passed, the GFS is scanned and the names compared. The GFS with the correct name (if one exists) is called with its own GFS pointer and a null VFS pointer.
- If FS_SYNCVFS_FS is passed, the mount point is looked up and, if it exists, VFS_SYNCVFS is called with the GFS pointer and the VFS pointer of the filesystem found.

Parameters

vfsName Depending on the value of the command parameter, this can either be NULL, the

name of a filesystem type (for example, "jfs", "j2") or the name of a filesystem,

specified by mount point (for example, "/testj2").

command Command is the mask of two options, a level and a granularity. The granularity can

be one of:

FS_SYNCVFS_ALL

sync every filesystem

FS_SYNCVFS_FSTYPE

sync every filesystem of VFS type corresponding to vfsName

FS_SYNCVFS_FS

sync specific filesystem at vfsName

The level can be one of:

FS_SYNCVFS_TRY

daemon heurstics

FS_SYNCVFS_FORCE

user requested sync

FS_SYNCVFS_QUIESCE

full filesystem quiesce

Return Values

Upon successful completion, the **syncvfs** subroutine returns 0. If unsuccessful, -1 is returned and the **errno** global variable is set.

_sync_cache_range Subroutine

Purpose

Synchronizes the I cache with the D cache.

Library

Standard C Library (libc.a)

Syntax

void _sync_cache_range (eaddr, count)
caddr_t eaddr;
uint count;

Description

The _sync_cache_range subroutine synchronizes the I cache with the D cache, given an effective address and byte count. Programs performing instruction modification can call this routine to ensure that the most recent instructions are fetched for the address range.

Parameters

eaddr Specifies the starting effective address of the address range.

count Specifies the byte count of the address range.

Related Information

The clf (Cache Line Flush) Instruction in Assembler Language Reference.

sysconf Subroutine

Purpose

Determines the current value of a specified system limit or option.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>

long int sysconf (Name) int Name;

Description

The **sysconf** subroutine determines the current value of certain system parameters, the configurable system limits, or whether optional features are supported. The Name parameter represents the system variable to be queried.

Parameters

Name Specifies which system variable setting should be returned. The valid values for the

Name parameter are defined in the limits.h, time.h, and unistd.h files and are

described below:

SC AIO LISTIO MAX Maximum number of Input and Output operations that can be specified in a list

Input and Output call.

SC AIO MAX Maximum number of outstanding asynchronous Input and Output operations.

_SC_ASYNCHRONOUS_IO Implementation supports the Asynchronous Input and Output option.

_SC_ARG_MAX Specifies the maximum byte length of the arguments for one of the exec

functions, including environment data.

_SC_BC_BASE_MAX Specifies the maximum number ibase and obase variables allowed by the bc

command.

Specifies the maximum number of elements permitted in an array by the bc _SC_BC_DIM_MAX

command.

SC BC SCALE MAX Specifies the maximum scale variable allowed by the bc command. Specifies the maximum length of a string constant allowed by the bc SC BC STRING MAX

_SC_CHILD_MAX Specifies the number of simultaneous processes per real user ID.

_SC_CLK_TCK Indicates the clock-tick increment as defined by the CLK_TCK in the time.h

_SC_COLL_WEIGHTS_MAX Specifies the maximum number of weights that can be assigned to an entry of

the LC_COLLATE keyword in the locale definition file.

SC DELAYTIMER MAX Maximum number of Timer expiration overruns. _SC_EXPR_NEST_MAX Specifies the maximum number of expressions that can be nested within

parentheses by the expr command.

_SC_JOB_CONTROL If this symbol is defined, job control is supported.

_SC_IOV_MAX Specifies the maximum number of iovec structures one process has available

for use with the **readv** and **writev** subroutines.

_SC_LARGE_PAGESIZE Size (in bytes) of a large-page.

SC LINE MAX Specifies the maximum byte length of a command's input line (either standard

input or another file) when a command is described as processing text files.

The length includes room for the trailing new-line character.

_SC_LOGIN_NAME_MAX Maximum length of a login name.

SC MQ OPEN MAX Maximum number of open message queue descriptors.

_SC_MQ_PRIO_MAX Maximum number of message priorities.

_SC_MEMLOCK Implementation supports the Process Memory Locking option.
_SC_MEMLOCK_RANGE Implementation supports the Range Memory Locking option.
_SC_MEMORY_PROTECTION Implementation supports the Memory Protection option.
_SC_MESSAGE_PASSING Implementation supports the Message Passing option.

_SC_NGROUPS_MAX Specifies the maximum number of simultaneous supplementary group IDs per

process.

_SC_OPEN_MAX Specifies the maximum number of files that one process can have open at any

one time.

_SC_PASS_MAX Specifies the maximum number of significant characters in a password (not

including the terminating null character).

_SC_PASS_MAX Maximum number of significant bytes in a password.

_SC_PAGESIZE Equivalent to _SC_PAGE_SIZE.

_SC_PAGE_SIZE Size in bytes of a page.

_SC_PRIORITIZED_IO Implementation supports the Prioritized Input and Output option.

_SC_PRIORITY_SCHEDULING Implementation supports the Process Scheduling option.

_SC_RE_DUP_MAX Specifies the maximum number of repeated occurrences of a regular

expression permitted when using the $\{m, n\}$ interval notation.

_SC_RTSIG_MAX Maximum number of Realtime Signals reserved for applications use.

_SC_REALTIME_SIGNALS Implementation supports the Realtime Signals Extension option.

_SC_SAVED_IDS If this symbol is defined, each process has a saved set-user ID and set-group

ID.

_SC_SEM_NSEMS_MAX Maximum number of Semaphores per process.
_SC_SEM_VALUE_MAX Maximum value a Semaphore may have.
_SC_SEMAPHORES Implementation supports the Semaphores option.

_SC_SHARED_MEMORY_OBJECTS Implementation supports the Shared Memory Objects option.

_SC_SIGQUEUE_MAX Maximum number of signals a process may send and have pending at any

time.

_SC_STREAM_MAX Specifies the maximum number of streams that one process can have open

simultaneously.

_SC_SYNCHRONIZED_IO Implementation supports the Synchronised Input and Output option.

_SC_TIMER_MAX Maximum number of per-process Timers.
_SC_TIMERS Implementation supports the Timers option.

_SC_TZNAME_MAX Specifies the maximum number of bytes supported for the name of a time

zone (not of the **TZ** value).

_SC_VERSION Indicates that the version or revision number of the POSIX standard is

implemented to indicate the 4-digit year and 2-digit month that the standard was approved by the IEEE Standards Board. This value is currently the long

integer 198808.

_SC_XBS5_ILP32_OFF32 Implementation provides a C-language compilation environment with 32-bit int,

long, pointer and off_t types.

_SC_XBS5_ILP32_OFFBIG Implementation provides a C-language compilation environment with 32-bit int,

long and pointer types and an off_t type using at least 64 bits.

Implementation provides a C-language compilation environment with 32-bit int _SC_XBS5_LP64_OFF64

and 64-bit long, pointer and off_t types.

Implementation provides a C-language compilation environment with an int _SC_XBS5_LPBIG_OFFBIG

type using at least 32 bits and long, pointer and off_t types using at least 64

SC XOPEN CRYPT Indicates that the system supports the X/Open Encryption Feature Group.

SC XOPEN LEGACY The implementation supports the Legacy Feature Group.

_SC_XOPEN_REALTIME The implementation supports the X/Open Realtime Feature Group.

_SC_XOPEN_REALTIME_THREADS The implementation supports the X/Open Realtime Threads Feature Group. _SC_XOPEN_ENH_I18N

Indicates that the system supports the X/Open Enhanced Internationalization

Feature Group.

SC XOPEN SHM Indicates that the system supports the X/Open Shared Memory Feature Group.

SC XOPEN VERSION Indicates that the version or revision number of the X/Open standard is

implemented.

_SC_XOPEN_XCU_VERSION Specifies the value describing the current version of the XCU specification.

_SC_ATEXIT_MAX Specifies the maximum number of register functions for the atexit subroutine.

_SC_PAGE_SIZE Specifies page-size granularity of memory.

Indicates OSF AES version. _SC_AES_OS_VERSION

SC 2 VERSION Specifies the value describing the current version of POSIX.2. _SC_2_C_BIND Indicates that the system supports the C Language binding option. _SC_2_C_CHAR_TERM Indicates that the system supports at least one terminal type.

_SC_2_C_DEV Indicates that the system supports the C Language Development Utilities

Option.

_SC_2_C_VERSION Specifies the value describing the current version of POSIX.2 with the C

Language binding.

_SC_2_FORT_DEV Indicates that the system supports the FORTRAN Development Utilities

Option.

SC 2 FORT RUN Indicates that the system supports the FORTRAN Development Utilities

SC 2 LOCALEDEF Indicates that the system supports the creation of locales.

_SC_2_SW_DEV Indicates that the system supports the Software Development Utilities Option.

_SC_2_UPE Indicates that the system supports the User Portability Utilities Option.

_SC_NPROCESSORS_CONF Number of processors configured. Number of processors online. _SC_NPROCESSORS_ONLN

SC THREAD DATAKEYS MAX Maximum number of data keys that can be defined in a process.

_SC_THREAD_DESTRUCTOR_ITERATIONS Maximum number attempts made to destroy a thread's

thread-specific data.

_SC_THREAD_KEYS_MAX Maximum number of data keys per process. SC THREAD STACK MIN Minimum value for the threads stack size. _SC_THREAD_THREADS_MAX Maximum number of threads within a process.

SC REENTRANT FUNCTIONS System supports reentrant functions (reentrant functions must be

used in multi-threaded applications).

SC_THREADS System supports POSIX threads.

System supports the stack address option for POSIX threads _SC_THREAD_ATTR_STACKADDR

(stackaddr attribute of threads).

System supports the stack size option for POSIX threads SC THREAD ATTR STACKSIZE

(stacksize attribute of threads).

SC_THREAD_PRIORITY_SCHEDULING System supports the priority scheduling for POSIX threads.

SC_THREAD_PRIO_INHERIT System supports the priority inheritance protocol for POSIX

threads (priority inversion protocol for mutexes).

_SC_THREAD_PRIO_PROTECT System supports the priority ceiling protocol for POSIX threads

(priority inversion protocol for mutexes).

_SC_THREAD_PROCESS_SHARED System supports the process sharing option for POSIX threads

(pshared attribute of mutexes and conditions).

_SC_TTY_NAME_MAX Maximum length of a terminal device name. **Note:** The _SYNCHRONIZED_IO, _SC_FSYNC, and SC_MAPPED_FILES commands apply to operating system version 4.3 and later releases.

_SC_SYNCHRONIZED_IO Implementation supports the Synchronized Input and Output

option.

_SC_FSYNC Implementation supports the File Synchronization option.

_SC_MAPPED_FILES Implementation supports the Memory Mapped Files option.

_SC_LPAR_ENABLED Indicates whether LPARs are enabled or not. _SC_AIX_KERNEL_BITMODE Determines if the kernel is 32-bit or 64-bit.

_SC_AIX_REALMEM Determines the amount of real memory in kilobytes.
_SC_AIX_HARDWARE_BITMODE Determines whether the machine is 32-bit or 64-bit.
_SC_AIX_MP_CAPABLE Determines if the hardware is MP-capable or not.

Note: The _SC_AIX_MP_CAPABLE variable is available only to

the root user.

_SC_AIX_UKEYS Number of user-keys available. A value of 0 indicates that

user-keys and the interfaces that manage them are not available.

The values returned for the variables supported by the system do not change during the lifetime of the process making the call.

Return Values

If the **sysconf** subroutine is successful, the current value of the system variable is returned. The returned value cannot be more restrictive than the corresponding value described to the application by the **limits.h**, **time.h**, or **unistd.h** file at compile time. The returned value does not change during the lifetime of the calling process. If the **sysconf** subroutine is unsuccessful, a value of -1 is returned.

Error Codes

If the *Name* parameter is invalid, a value of -1 is returned and the **errno** global variable is set to indicate the error. If the *Name* parameter is valid but is a variable not supported by the system, a value of -1 is returned, and the **errno** global variable is set to a value of **EINVAL**. If the system variable

_SC_AIX_MP_CAPABLE is accessed by a non-root user, a value of -1 is returned and the errno global variable indicates the error

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sysconfig Subroutine

Purpose

Provides a service for controlling system/kernel configuration.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/types.h>
#include <sys/sysconfig.h>
int sysconfig (Cmd, Parmp, Parmlen)
int Cmd;
void *Parmp;
int Parmlen;
```

Description

SYS_KLOAD

The sysconfig subroutine is used to customize the operating system. This subroutine provides a means of loading, unloading, and configuring kernel extensions. These kernel extensions can be additional kernel services, system calls, device drivers, or File systems in Operating system and device management. The sysconfig subroutine also provides the ability to read and set system run-time operating parameters.

Use of the **sysconfig** subroutine requires appropriate privilege.

The particular operation that the **sysconfig** subroutine provides is defined by the value of the *Cmd* parameter. The following operations are defined:

Loads a kernel extension object file into kernel memory.

Loads a kerner extension object the into kerner memory.
Loads a kernel extension object file only if it is not already loaded.
Determines if a specified kernel object file is loaded.
Unloads a previously loaded kernel object file.
Checks the status of a device switch entry in the device switch table.
Calls the specified device driver configuration routine (module entry point).
Calls the specified module at its module entry point for configuration purposes.
Returns a structure containing the current values of run-time system parameters found in the var structure.
Sets run-time system parameters from a caller-provided structure.
Copies the system LPAR information into a user-allocated buffer.

page 374)

In addition, the SYS 64BIT flag can be bitwise or'ed with the Cmd parameter (if the Cmd parameter is SYS KLOAD or SYS SINGLELOAD). For kernel extensions, this indicates that the kernel extension does not export 64-bit system calls, but that all 32-bit system calls also work for 64-bit applications. For device drivers, this indicates that the device driver can be used by 64-bit applications.

"Loader Symbol Binding Support" on page 376 explains the symbol binding support provided when loading kernel object files.

Parameters

Cmd Specifies the function that the **sysconfig** subroutine is to perform.

Specifies a user-provided structure. Parmp

Parmlen Specifies the length of the user-provided structure indicated by the *Parmp* parameter.

Return Values

These sysconfig operations return a value of 0 upon successful completion of the subroutine. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Any sysconfig operation requiring a structure from the caller fails if the structure is not entirely within memory addressable by the calling process. A return value of -1 is passed back and the errno global variable is set to **EFAULT**.

Related Information

The **ddconfig** device driver entry point.

Device Configuration Subsystem, Kernel Environment, Understanding Kernel Extension Binding in AIX 5L Version 5.3 Kernel Extensions and Device Support Programming Concepts.

SYS CFGDD sysconfig Operation

Purpose

Calls a previously loaded device driver at its module entry point.

Description

The SYS_CFGDD sysconfig operation calls a previously loaded device driver at its module entry point. The device driver's module entry point, by convention, is its **ddconfig** entry point. The **SYS CFGDD** operation is typically invoked by device configure or unconfigure methods to initialize or terminate a device driver, or to request device vital product data.

The sysconfig subroutine puts no restrictions on the command code passed to the device driver. This allows the device driver's **ddconfig** entry point to provide additional services, if desired.

The parmp parameter on the SYS_CFGDD operation points to a cfg_dd structure defined in the sys/sysconfig.h file. The parmlen parameter on the sysconfig system call should be set to the size of this structure.

If the kmid variable in the cfg_dd structure is 0, the desired device driver is assumed to be already installed in the device switch table. The major portion of the device number (passed in the devno field in the cfg_dd structure) is used as an index into the device switch table. The device switch table entry indexed by this devno field contains the device driver's ddconfig entry point to be called.

If the kmid variable is not 0, it contains the module ID to use in calling the device driver. A uio structure is used to pass the address and length of the device-dependent structure, specified by the cfg dd.ddsptr and cfg dd.ddslen fields, to the device driver being called.

The **ddconfig** device driver entry point provides information on how to define the **ddconfig** subroutine.

The device driver to be called is responsible for using the appropriate routines to copy the device-dependent structure (DDS) from user to kernel space.

Return Values

If the SYS CFGDD operation successfully calls the specified device driver, the return code from the ddconfig subroutine determines the value returned by this subroutine. If the ddconfig routine's return code is 0, then the value returned by the sysconfig subroutine is 0. Otherwise the value returned is a -1, and the errno global variable is set to the return code provided by the device driver ddconfig subroutine.

Error Codes

Errors detected by the SYS_CFGDD operation result in the following values for the errno global variable:

The calling process does not have the required privilege.

EFAULT The calling process does not have sufficient authority to access the data area described by the parmp

and parmlen parameters provided on the system call. This error is also returned if an I/O error occurred

when accessing data in this area.

Invalid module ID. EINVAL

ENODEV Module ID specified by the cfg_dd.kmid field was 0, and an invalid or undefined devno value was

specified.

SYS_CFGKMOD sysconfig Operation

Purpose

Invokes a previously loaded kernel object file at its module entry point.

Description

The SYS_CFGKMOD sysconfig operation invokes a previously loaded kernel object file at its module entry point, typically for initialization or termination functions. The SYS CFGDD ("SYS CFGDD sysconfig Operation" on page 371) operation performs a similar function for device drivers.

The parmp parameter on the sysconfig subroutine points to a cfg kmod structure, which is defined in the sys/sysconfig.h file. The kmid field in this structure specifies the kernel module ID of the module to

invoke. This value is returned when using the SYS_KLOAD ("SYS_KLOAD sysconfig Operation" on page 376) or SYS SINGLELOAD ("SYS SINGLELOAD sysconfig Operation" on page 383) operation to load the object file.

The cmd field in the cfg_kmod structure is a module-dependent parameter specifying the action that the routine at the module's entry point should perform. This is typically used for initialization and termination commands after loading and prior to unloading the object file.

The mdiptr field in the cfg_kmod structure points to a module-dependent structure whose size is specified by the mdilen field. This field is used to provide module-dependent information to the module to be called. If no such information is needed, the mdiptr field can be null.

If the mdiptr field is not null, then the SYS_CFGKMOD operation builds a uio structure describing the address and length of the module-dependent information in the caller's address space. The mdiptr and mdilen fields are used to fill in the fields of this uio structure. The module is then called at its module entry point with the *cmd* parameter and a pointer to the **uio** structure. If there is no module-dependent information to be provided, the *uiop* parameter passed to the module's entry point is set to null.

The module's entry point should be defined as follows:

```
int module_entry(cmd, uiop)
int cmd;
struct uio *uiop;
```

The definition of the module-dependent information and its length is specific to the module being configured. The called module is responsible for using the appropriate routines to copy the module-dependent information from user to kernel space.

Return Values

If the kernel module to be invoked is successfully called, its return code determines the value that is returned by the SYS CFGKMOD operation. If the called module's return code is 0, then the value returned by the sysconfig subroutine is 0. Otherwise the value returned is -1 and the errno global variable is set to the called module's return code.

Error Codes

Errors detected by the SYS CFGKMOD operation result in the following values for the errno global variable:

EINVAL Invalid module ID.

EACCES The calling process does not have the required privilege.

EFAULT The calling process does not have sufficient authority to access the data area described by the parmp

and parmlen parameters provided on the system call. This error is also returned if an I/O error occurred

when accessing data in this area.

SYS GETLPAR INFO sysconfig Operation

Purpose

Copies the system LPAR information into a user-allocated buffer.

Description

The SYS_GETLPAR_INFO sysconfig operation copies the system LPAR information into a user-allocated buffer.

The parmp parameter on the sysconfig subroutine points to a structure of type getlpar_info. Within the getlpar_info structure, the Ipar_namelen field must be set by the user to the maximum length of the character buffer pointed to by Ipar_name. On return, the Ipar_namelen field will have its value replaced by the acual length of the *lpar name* field. However, only the minimum of the actual length or the length provided by the user will be copied into the buffer pointed to by Ipar_name. The Ipar_namesz, Ipar_num, and *lpar name* fields will contain valid data on returning from the call only if the system is running as an LPAR as indicated by the value of the *lpar_flags* field being equal to **LPAR_ENABLED**.

If a value of 0 is specified for the *lpar_namesz* field, the partition name will not be copied out.

If the system is not an LPAR (namely it is running as an SMP system), but it is LPAR-capable, the LPAR_CAPABLE flag will be set on return.

The **getlpar_info** structure is defined below:

lpar_flags	unsigned short	LPAR_ENABLED: System is LPAR enabled. LPAR_CAPABLE: System is LPAR capable, but running in SMP mode.
lpar namesz	unsigned short	Size of partition name.
lpar num	int	Partition Number.
lpar name	char *	Partition Name.

Note: The parmlen parameter (which is the third parameter to the sysconfig system call) is ignored by the SYS_GETLPAR_INFO sysconfig operation.

Error Codes

The SYS GETLPAR_INFO operation returns a value of -1 if an error occurs and the errno global variable is set to one of the following error codes:

The calling process does not have sufficient authority to access the data area described by the parmp **EFAULT** and parmlen parameters provided on the subroutine or the Ipar_name field in the getlpar_info structure. This error is also returned if an I/O error occurred when accessing data in any of these areas.

EINVAL Invalid command parameter to the sysconfig subroutine.

SYS_GETPARMS sysconfig Operation

Purpose

Copies the system parameter structure into a user-specified buffer.

Description

The SYS_GETPARMS sysconfig operation copies the system parameter var structure into a user-allocated buffer. This structure may be used for informational purposes alone or prior to setting specific system parameters.

In order to set system parameters, the required fields in the var structure must be modified, and then the SYS_SETPARMS ("SYS_SETPARMS sysconfig Operation" on page 382) operation can be called to change the system run-time operating parameters to the desired state.

The parmp parameter on the sysconfig subroutine points to a buffer that is to contain all or part of the var structure defined in the sys/var.h file. The fields in the var hdr part of the var structure are used for parameter update control.

The parmlen parameter on the system call should be set to the length of the var structure or to the number of bytes of the structure that is desired. The complete definition of the system parameters structure can be found in the sys/var.h file.

Return Values

The SYS GETPARMS operation returns a value of -1 if an error occurs and the errno global variable is set to one of the following error codes.

Error Codes

EACCES

The calling process does not have the required privilege.

EFAULT

The calling process does not have sufficient authority to access the data area described by the parmp and parmlen parameters provided on the subroutine. This error is also returned if an I/O error occurred when accessing data in this area.

Programming in the Kernel Environment Overview in AIX 5L Version 5.3 Kernel Extensions and Device Support Programming Concepts.

SYS_KLOAD sysconfig Operation

Purpose

Loads a kernel extension into the kernel.

Description

The SYS KLOAD sysconfig operation is used to load a kernel extension object file specified by a path name into the kernel. A kernel module ID for that instance of the module is returned. The SYS KLOAD operation loads a new copy of the object file into the kernel even though one or more copies of the specified object file may have already been loaded into the kernel. The returned module ID can then be used for any of these three functions:

- Subsequent invocation of the module's entry point (using the SYS CFGKMOD ("SYS CFGKMOD) sysconfig Operation" on page 372) operation)
- Invocation of a device driver's ddconfig subroutine (using the SYS_CFGDD ("SYS_CFGDD sysconfig Operation" on page 371) operation)
- Unloading the kernel module (using the SYS KULOAD ("SYS KULOAD sysconfig Operation" on page 378) operation).

The parmp parameter on the sysconfig subroutine must point to a cfg_load structure, (defined in the sys/sysconfig.h file), with the path field specifying the path name for a valid kernel object file. The parmlen parameter should be set to the size of the cfg load structure.

Note: A separate sysconfig operation, the SYS_SINGLELOAD ("SYS_SINGLELOAD sysconfig Operation" on page 383) operation, also loads kernel extensions. This operation, however, only loads the requested object file if not already loaded.

Loader Symbol Binding Support

The following information describes the symbol binding support provided when loading kernel object files.

Importing Symbols

Symbols imported from the kernel name space are resolved with symbols that exist in the kernel name space at the time of the load. (Symbols are imported from the kernel name space by specifying the #!/unix character string as the first field in an import list at link-edit time.)

Kernel modules can also import symbols from other kernel object files. These other kernel object files are loaded along with the specified object file if they are required to resolve the imported symbols.

Finding Directory Locations for Unqualified File Names: If the module header contains an unqualified base file name for the symbol (that is, no / [slash] characters in the name), a libpath search string is used to find the location of the shared object file required to resolve imported symbols. This librath search string can be taken from one of two places. If the libpath field in the cfg load structure is not null, then it points to a character string specifying the libpath to be used. However, if the libpath field is null, then the libpath is taken from the module header of the object file specified by the path field in the same (cfg load) structure.

The libpath specification found in object files loaded in order to resolve imported symbols is not used.

The kernel loader service does not support deferred symbol resolution. The load of the kernel object file is terminated with an error if any imported symbols cannot be resolved.

Exporting Symbols

Any symbols exported by the specified kernel object file are added to the kernel name space. This makes these symbols available to other subsequently loaded kernel object files. Any symbols specified with the SYSCALL keyword in the export list at link-edit time are added to the system call table at load time. These symbols are then available to application programs as a system call. Symbols can be added to the 32-bit and 64-bit system call tables separately by using the syscall32 and syscall64 keywords. Symbols can be added to both system call tables by using the syscall3264 keyword. A kernel extension that just exports 32-bit system calls can have all its system calls exported to 64-bit as well by passing the SYS 64BIT flag or'ed with the SYS KLOAD command to sysconfig.

Kernel object files loaded on behalf of the specified kernel object file to resolve imported symbols do not have their exported symbols added to the kernel name space.

These object files are considered private since they do not export symbols to the global kernel name space. For these types of object files, a new copy of the object file is loaded on each SYS KLOAD operation of a kernel extension that imports symbols from the private object file. In order for a kernel extension to add its exported symbols to the kernel name space, it must be explicitly loaded with the SYS_KLOAD operation before any other object files using the symbols are loaded. For kernel extensions of this type (those exporting symbols to the kernel name space), typically only one copy of the object file should ever be loaded.

Return Values

If the object file is loaded without error, the module ID is returned in the kmid variable within the cfg_load structure and the subroutine returns a value of 0.

Error Codes

On error, the subroutine returns a value of -1 and the errno global variable is set to one of the following values:

EACCES One of the following reasons applies:

- · The calling process does not have the required privilege.
- · An object module to be loaded is not an ordinary file.
- The mode of the object module file denies read-only permission.

EFAULT The calling process does not have sufficient authority to access the data area described by the parmp

and parmlen parameters provided on the system call. This error is also returned if an I/O error occurred

when accessing data in this area.

ENOEXEC The program file has the appropriate access permission, but has an invalid XCOFF object file indication

in its header. The SYS KLOAD operation only supports loading of XCOFF object files. This error is

also returned if the loader is unable to resolve an imported symbol.

The program file has a valid XCOFF indicator in its header, but the header is damaged or is incorrect EINVAL

for the machine on which the file is to be run.

ENOMEM The load requires more kernel memory than is allowed by the system-imposed maximum.

ETXTBSY The object file is currently open for writing by some process.

Understanding Kernel Extension Binding in AIX 5L Version 5.3 Kernel Extensions and Device Support Programming Concepts.

SYS KULOAD sysconfig Operation

Purpose

Unloads a loaded kernel object file and any imported kernel object files that were loaded with it.

Description

The SYS_KULOAD sysconfig operation unloads a previously loaded kernel file and any imported kernel object files that were automatically loaded with it. It does this by decrementing the load and use counts of the specified object file and any object file having symbols imported by the specified object file.

The parmp parameter on the sysconfig subroutine should point to a cfg_load structure, as described for the SYS_KLOAD ("SYS_KLOAD sysconfig Operation" on page 376) operation. The kmid field should specify the kernel module ID that was returned when the object file was loaded by the SYS_KLOAD or SYS_SINGLELOAD ("SYS_SINGLELOAD sysconfig Operation" on page 383) operation. The path and libpath fields are not used for this command and can be set to null. The parmlen parameter should be set to the size of the **cfg_load** structure.

Upon successful completion, the specified object file (and any other object files containing symbols that the specified object file imports) will have their load and use counts decremented. If there are no users of any of the module's exports and its load count is 0, then the object file is immediately unloaded.

However, if there are users of this module (that is, modules bound to this module's exported symbols), the specified module is not unloaded. Instead, it is unloaded on some subsequent unload request, when its use and load counts have gone to 0. The specified module is not in fact unloaded until all current users have been unloaded.

Notes:

- 1. Care must be taken to ensure that a subroutine has freed all of its system resources before being unloaded. For example, a device driver is typically prepared for unloading by using the SYS CFGDD ("SYS CFGDD sysconfig Operation" on page 371) operation and specifying termination.
- 2. If the use count is not 0, and you cannot force it to 0, the only way to terminate operation of the kernel extension is to reboot the machine.

"Loader Symbol Binding Support" on page 376 explains the symbol binding support provided when loading kernel object files.

Return Values

If the unload operation is successful or the specified object file load count is successfully decremented, a value of 0 is returned.

Error Codes

On error, the specified file and any imported files are not unloaded, nor are their load and use counts decremented. A value of -1 is returned and the errno global variable is set to one of the following:

EACCES The calling process does not have the required privilege.

EINVAL Invalid module ID or the specified module is no longer loaded or already has a load count of 0.

EFAULT The calling process does not have sufficient authority to access the data area described by the parmp

and parmlen parameters provided to the subroutine. This error is also returned if an I/O error occurred

when accessing data in this area.

SYS QDVSW sysconfig Operation

Purpose

Checks the status of a device switch entry in the device switch table.

Description

The SYS QDVSW sysconfig operation checks the status of a device switch entry in the device switch table.

The parmp parameter on the sysconfig subroutine points to a qry_devsw structure defined in the sys/sysconfig.h file. The parmlen parameter on the subroutine should be set to the length of the qry_devsw structure.

The qry devsw field in the qry_devsw structure is modified to reflect the status of the device switch entry specified by the qry devsw field. (Only the major portion of the devno field is relevant.) The following flags can be returned in the status field:

DSW UNDEFINED The device switch entry is not defined if this flag has a value of 0 on return.

DSW DEFINED The device switch entry is defined.

DSW CREAD The device driver in this device switch entry provides a routine for character reads or raw

input. This flag is set when the device driver provides a **ddread** entry point.

DSW_CWRITE The device driver in this device switch entry provides a routine for character writes or raw

output. This flag is set when the device driver provides a ddwrite entry point.

The device switch entry is defined by a block device driver. This flag is set when the device DSW_BLOCK

driver provides a **ddstrategy** entry point.

The device switch entry is defined by a multiplexed device driver. This flag is set when the DSW_MPX

device driver provides a ddmpx entry point.

The device driver in this device switch entry provides a routine for handling the select **DSW SELECT**

("select Subroutine" on page 146) or poll subroutines. This flag is set when the device

driver provides a **ddselect** entry point.

DSW_DUMP The device driver defined by this device switch entry provides the capability to support one

or more of its devices as targets for a kernel dump. This flag is set when the device driver

has provided a dddump entry point.

DSW_CONSOLE The device switch entry is defined by the console device driver.

DSW_TCPATH The device driver in this device switch entry supports devices that are considered to be in

> the trusted computing path and provides support for the revoke ("revoke Subroutine" on page 62) and frevoke subroutines. This flag is set when the device driver provides a

ddrevoke entry point.

The device switch entry is defined and the device has outstanding opens. This flag is set DSW_OPENED

when the device driver has at least one outstanding open.

The **DSW_UNDEFINED** condition is indicated when the device switch entry has not been defined or has been defined and subsequently deleted. Multiple status flags may be set for other conditions of the device switch entry.

Return Values

If no error is detected, this operation returns with a value of 0. If an error is detected, the return value is set to a value of -1.

Error Codes

When an error is dected, the **errno** global variable is also set to one of the following values:

EACCES The calling process does not have the required privilege.

EINVAL Device number exceeds the maximum allowed by the kernel.

EFAULT The calling process does not have sufficient authority to access the data area described by the parmp

and parmlen parameters provided on the system call. This error is also returned if an I/O error occurred

when accessing data in this area.

SYS QUERYLOAD sysconfig Operation

Purpose

Determines if a kernel object file has already been loaded.

Description

The SYS QUERYLOAD sysconfig operation performs a query operation to determine if a given object file has been loaded. This object file is specified by the path field in the cfg load structure passed in with the parmp parameter. This operation utilizes the same cfg load structure that is specified for the SYS KLOAD ("SYS KLOAD sysconfig Operation" on page 376) operation.

If the specified object file is not loaded, the kmid field in the cfg load structure is set to a value of 0 on return. Otherwise, the kernel module ID of the module is returned in the kmid field. If multiple instances of the module have been loaded into the kernel, the module ID of the one most recently loaded is returned.

The libpath field in the **cfg_load** structure is not used for this option.

Note: A path-name comparison is done to determine if the specified object file has been loaded. However, this operation will erroneously return a not loaded condition if the path name to the object file is expressed differently than it was on a previous load request.

"Loader Symbol Binding Support" on page 376 explains the symbol binding support provided when loading kernel object files.

Return Values

If the specified object file is found, the module ID is returned in the kmid variable within the cfg_load structure and the subroutine returns a 0. If the specified file is not found, a kmid variable of 0 is returned with a return code of 0.

Error Codes

On error, the subroutine returns a -1 and the **errno** global variable is set to one of the following values:

EACCES The calling process does not have the required privilege.

The calling process does not have sufficient authority to access the data area described by the parmp **EFAULT**

and parmlen parameters provided on the subroutine. This error is also returned if an I/O error occurred

when accessing data in this area.

EFAULT The path parameter points to a location outside of the allocated address space of the process.

An I/O error occurred during the operation. EIO

SYS SETPARMS sysconfig Operation

Purpose

Sets the kernel run-time tunable parameters.

Description

The SYS SETPARMS sysconfig operation sets the current system parameters from a copy of the system parameter var structure provided by the caller. Only the run-time tunable parameters in the var structure can be set by this subroutine.

If the var vers and var gen values in the caller-provided structure do not match the var vers and var gen values in the current system var structure, no parameters are modified and an error is returned. The var vers, var gen, and var size fields in the structure should not be altered. The var vers value is assigned by the kernel and is used to insure that the correct version of the structure is being used. The var_gen value is a generation number having a new value for each read of the structure. This provides consistency between the data read by the SYS_GETPARMS ("SYS_GETPARMS sysconfig Operation" on page 375) operation and the data written by the SYS_SETPARMS operation.

The parmp parameter on the sysconfig subroutine points to a buffer that contains all or part of the var structure as defined in the sys/var.h file.

The parmler parameter on the subroutine should be set either to the length of the var structure or to the size of the structure containing the parameters to be modified. The number of system parameters modified by this operation is determined either by the parmlen parameter value or by the var size field in the caller-provided **var** structure. (The smaller of the two values is used.)

The structure provided by the caller must contain at least the header fields of the **var** structure. Otherwise, an error will be returned. Partial modification of a parameter in the var structure can occur if the caller's data area does not contain enough data to end on a field boundary. It is up to the caller to ensure that this does not happen.

Return Values

The SYS_SETPARMS sysconfig operation returns a value of -1 if an error occurred.

Error Codes

When an error occurs, the **errno** global variable is set to one of the following values:

EACCES EINVAL

The calling process does not have the required privilege.

One of the following error situations exists:

- · The var vers version number of the provided structure does not match the version number of the current var structure.
- · The structure provided by the caller does not contain enough data to specify the header fields within the var structure.
- · One of the specified variable values is invalid or not allowed. On the return from the subroutine, the var vers field in the caller-provided buffer contains the byte offset of the first variable in the structure that was detected in error.

EAGAIN The var gen generation number in the structure provided does not match the current generation number

in the kernel. This occurs if consistency is lost between reads and writes of this structure. The caller

should repeat the read, modify, and write operations on the structure.

EFAULT The calling process does not have sufficient authority to access the data area described by the parmp

and parmlen parameters provided to the subroutine. This error is also returned if an I/O error occurred

when accessing data in this area.

Programming in the Kernel Environment Overview in AIX 5L Version 5.3 Kernel Extensions and Device Support Programming Concepts.

SYS_SINGLELOAD sysconfig Operation

Purpose

Loads a kernel extension module if it is not already loaded.

Description

The SYS SINGLELOAD sysconfig operation is identical to the SYS KLOAD ("SYS KLOAD sysconfig Operation" on page 376) operation, except that the SYS SINGLELOAD operation loads the object file only if an object file with the same path name has not already been loaded into the kernel.

If an object file with the same path name has already been loaded, the module ID for that object file is returned in the kmid field and its load count incremented. If the object file is not loaded, this operation performs the load request exactly as defined for the SYS KLOAD operation.

This option is useful in supporting global kernel routines where only one copy of the routine and its data can be present. Typically routines that export symbols to be added to the kernel name space are of this type.

Note: A path name comparison is done to determine if the same object file has already been loaded. However, this function will erroneously load a new copy of the object file into the kernel if the path name to the object file is expressed differently than it was on a previous load request.

"Loader Symbol Binding Support" on page 376 explains the symbol binding support provided when loading kernel object files.

Return Values

The SYS_SINGLELOAD operation returns the same set of error codes that the SYS_KLOAD operation returns.

syslog, openlog, closelog, or setlogmask Subroutine

Purpose

Controls the system log.

Library

Standard C Library (libc.a)

Syntax

#include <syslog.h>

void openlog (ID, LogOption, Facility) const char *ID; int LogOption, Facility;

void syslog (Priority, Value,...) int Priority: const char *Value;

void closelog ()

int setlogmask(MaskPriority) int MaskPriority:

void bsdlog (Priority, Value,...) int Priority; const char *Value;

Description

Attention: Do not use the syslog, openlog, closelog, or setlogmask subroutine in a multithreaded environment. See the multithread alternatives in the syslog_r ("syslog_r, openlog_r, closelog_r, or setlogmask r Subroutine" on page 387), openlog r, closelog r, or setlogmask r subroutine article. The syslog subroutine is not threadsafe; for threadsafe programs the syslog r subroutine should be used instead.

The syslog subroutine writes messages onto the system log maintained by the syslogd command.

Note: Messages passed to syslog that are longer than 900 bytes may be truncated by syslogd before being logged.

The message is similar to the **printf** fmt string, with the difference that %m is replaced by the current error message obtained from the errno global variable. A trailing new-line can be added to the message if needed.

Messages are read by the **syslogd** command and written to the system console or log file, or forwarded to the **syslogd** command on the appropriate host.

If special processing is required, the **openlog** subroutine can be used to initialize the log file.

Messages are tagged with codes indicating the type of *Priority* for each. A *Priority* is encoded as a *Facility*. which describes the part of the system generating the message, and as a level, which indicates the severity of the message.

If the **syslog** subroutine cannot pass the message to the **syslogd** command, it writes the message on the /dev/console file, provided the LOG CONS option is set.

The **closelog** subroutine closes the log file.

The **setlogmask** subroutine uses the bit mask in the *MaskPriority* parameter to set the new log priority mask and returns the previous mask.

The LOG_MASK and LOG_UPTO macros in the sys/syslog.h file are used to create the priority mask. Calls to the **syslog** subroutine with a priority mask that does not allow logging of that particular level of message causes the subroutine to return without logging the message.

Parameters

ID

Contains a string that is attached to the beginning of every message. The Facility parameter encodes a default facility from the previous list to be assigned to messages that do not have an explicit facility encoded.

LogOption

Specifies a bit field that indicates logging options. The values of LogOption are:

Sends messages to the console if unable to send them to the syslogd command. This option is useful in daemon processes that have no controlling terminal.

LOG_NDELAY

Opens the connection to the syslogd command immediately, instead of when the first message is logged. This option is useful for programs that need to manage the order in which file descriptors are allocated.

LOG_NOWAIT

Logs messages to the console without waiting for forked children. Use this option for processes that enable notification of child termination through SIGCHLD; otherwise, the syslog subroutine may block, waiting for a child process whose exit status has already been collected.

LOG_ODELAY

Delays opening until the syslog subroutine is called.

LOG_PID

Logs the process ID with each message. This option is useful for identifying daemons.

Facility

Specifies which of the following values generated the message:

LOG_AUTH

Indicates the security authorization system: the login command, the su command, and so on.

LOG_DAEMON

Logs system daemons.

LOG_KERN

Logs messages generated by the kernel. Kernel processes should use the bsdlog routine to generate syslog messages. The syntax of bsdlog is identical to syslog. The bsdlog messages can only be created by kernel processes and must be of LOG_KERN priority. The syslog subroutine cannot log LOG_KERN facility messages. Instead it will log LOG_USER facility messages.

LOG LPR

Logs the line printer spooling system.

LOG_LOCAL0 through LOG_LOCAL7

Reserved for local use.

LOG_MAIL

Logs the mail system.

LOG_NEWS

Logs the news subsystem.

LOG_UUCP

Logs the UUCP subsystem.

LOG USER

Logs messages generated by user processes. This is the default facility when none is specified.

Specifies the part of the system generating the message, and as a level, indicates the severity of the message. The level of severity is selected from the following list:

LOG_ALERT

Indicates a condition that should be corrected immediately; for example, a corrupted database.

LOG_CRIT

Indicates critical conditions; for example, hard device errors.

LOG_DEBUG

Displays messages containing information useful to debug a program.

LOG_EMERG

Indicates a panic condition reported to all users; system is unusable.

LOG ERR

Indicated error conditions.

LOG_INFO

Indicates general information messages.

LOG NOTICE

Indicates a condition requiring special handling, but not an error condition.

LOG_WARNING

Logs warning messages.

MaskPriority

Enables logging for the levels indicated by the bits in the mask that are set and disabled where the bits are not set. The default mask allows all priorities to be logged.

Specifies the values given in the Value parameters and follows the the same syntax as the printf subroutine Format parameter.

Priority

Value

Examples

1. To log an error message concerning a possible security breach, such as the following, enter: syslog (LOG ALERT, "who:internal error 23");

```
2. To initialize the log file, set the log priority mask, and log an error message, enter:
```

```
openlog ("ftpd", LOG_PID, LOG_DAEMON);
setlogmask (LOG_UPTO (LOG_ERR));
syslog (LOG INFO, "");
```

3. To log an error message from the system, enter:

```
syslog (LOG INFO | LOG LOCAL2, "foobar error: %m");
```

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

syslog_r, openlog_r, closelog_r, or setlogmask_r Subroutine

Purpose

Controls the system log.

Library

Standard C Library (libc.a)

Syntax

```
#include <syslog.h>
int syslog_r (Priority, SysLogData, Format, . . .)
int Priority;
struct syslog_data * SysLogData;
const char * Format;
int openlog r (ID, LogOption, Facility, SysLogData)
const char * ID;
int LogOption;
int Facility;
struct syslog_data *SysLogData;
void closelog r (SysLogData)
struct syslog_data *SysLogData;
int setlogmask_r ( MaskPriority, SysLogData)
int MaskPriority;
struct syslog_data *SysLogData;
```

Description

The syslog_r subroutine writes messages onto the system log maintained by the syslogd daemon.

The messages are similar to the Format parameter in the printf subroutine, except that the %m field is replaced by the current error message obtained from the errno global variable. A trailing new-line character can be added to the message if needed.

Messages are read by the syslogd daemon and written to the system console or log file, or forwarded to the **syslogd** daemon on the appropriate host.

If a program requires special processing, you can use the **openlog** r subroutine to initialize the log file.

The syslog r subroutine takes as a second parameter a variable of the type struct syslog data, which should be provided by the caller. When that variable is declared, it should be set to the SYSLOG_DATA_INIT value, which specifies an initialization macro defined in the sys/syslog.h file. Without initialization, the data structure used to support the thread safety is not set up and the syslog r subroutine does not work properly.

Messages are tagged with codes indicating the type of *Priority* for each. A *Priority* is encoded as a *Facility*, which describes the part of the system generating the message, and as a level, which indicates the severity of the message.

If the syslog r subroutine cannot pass the message to the syslogd daemon, it writes the message the /dev/console file, provided the LOG CONS option is set.

The **closelog_r** subroutine closes the log file.

The **setlogmask** r subroutine uses the bit mask in the *MaskPriority* parameter to set the new log priority mask and returns the previous mask.

The LOG_MASK and LOG_UPTO macros in the sys/syslog.h file are used to create the priority mask. Calls to the syslog_r subroutine with a priority mask that does not allow logging of that particular level of message causes the subroutine to return without logging the message.

Programs using this subroutine must link to the **libpthreads.a** library.

Parameters

Priority

Specifies the part of the system generating the message and indicates the level of severity of the message. The level of severity is selected from the following list:

- · A condition that should be corrected immediately, such as a corrupted database.
- · A critical condition, such as hard device errors.
- · A message containing information useful to debug a program.
- · A panic condition reported to all users, such as an unusable system.
- · An error condition.
- · A general information message.
- · A condition requiring special handling, other than an error condition.
- · A warning message.

SysLogData

Specifies a structure that contains the following information:

- · The file descriptor for the log file.
- · The status bits for the log file.
- · A string for tagging the log entry.
- · The mask of priorities to be logged.
- · The default facility code.
- The address of the local logger.

Format

Specifies the format, given in the same format as for the printf subroutine.

Contains a string attached to the beginning of every message. The Facility parameter encodes a default facility from the previous list to be assigned to messages that do not have an explicit facility encoded.

LogOption

Specifies a bit field that indicates logging options. The values of *LogOption* are:

LOG_CONS

Sends messages to the console if unable to send them to the **syslogd** command. This option is useful in daemon processes that have no controlling terminal.

LOG_NDELAY

Opens the connection to the **syslogd** command immediately, instead of when the first message is logged. This option is useful for programs that need to manage the order in which file descriptors are allocated.

LOG_NOWAIT

Logs messages to the console without waiting for forked children. Use this option for processes that enable notification of child termination through **SIGCHLD**; otherwise, the **syslog** subroutine may block, waiting for a child process whose exit status has already been collected.

LOG_ODELAY

Delays opening until the syslog subroutine is called.

LOG_PID

Logs the process ID with each message. This option is useful for identifying daemons.

Facility

Specifies which of the following values generated the message:

LOG_AUTH

Indicates the security authorization system: the login command, the su command, and so on.

LOG_DAEMON

Logs system daemons.

LOG_KERN

Logs messages generated by the kernel. Kernel processes should use the bsdlog routine to generate syslog messages. The syntax of bsdlog is identical to syslog. The bsdlog messages can only be created by kernel processes and must be of LOG_KERN priority.

LOG LPR

Logs the line printer spooling system.

LOG_LOCAL0 through LOG_LOCAL7

Reserved for local use.

LOG MAIL

Logs the mail system.

LOG NEWS

Logs the news subsystem.

LOG UUCP

Logs the UUCP subsystem.

LOG_USER

Logs messages generated by user processes. This is the default facility when none is specified.

- Remote file systems, such as the Andrew File System (AFS).
- · The UUCP subsystem.
- · Messages generated by user processes. This is the default facility when none is specified.

MaskPriority

Enables logging for the levels indicated by the bits in the mask that are set, and disables logging where the bits are not set. The default mask allows all priorities to be logged.

Return Values

- Indicates that the subroutine was successful.
- -1 Indicates that the subroutine was not successful. Moves an error code, indicating the specific error, into the errno global variable.

Error Codes

When the syslog_r subroutine is unsuccessful, the errno global variable can be set to the following values:

EAGAIN Exceeds the limit on the total number of processes running either system-wide or by a single user,

or the system does not have the resources necessary to create another process.

EBADF The syslogd daemon is not active.

ECONNRESET The **syslogd** daemon stopped during the operation.

ENOBUFS Buffer resources were not available. **ENOMEM** Not enough space exists for this process.

ENOTCONN The **syslogd** daemon stopped during the operation. EPROCLIM If WLM is running, the limit on the number of processes or threads in the class might have been

met.

EINVAL The Priority parameter is not a valid parameter.

Examples

1. To log an error message concerning a possible security breach, enter:

```
syslog r (LOG ALERT, syslog data struct, "%s", "who:internal error 23");
```

2. To initialize the log file, set the log priority mask, and log an error message, enter:

```
openlog_r ("ftpd", LOG_PID, LOG_DAEMON, syslog_data_struct);
setlogmask_r (LOG_UPTO (LOG_ERR), syslog_data_struct);
syslog_r (LOG_INFO, syslog_data_struct, "");
```

3. To log an error message from the system, enter:

```
syslog_r (LOG_INFO | LOG_LOCAL2, syslog_data_struct, "system error: %m");
```

Subroutines Overview and List of Multithread Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

sys_parm Subroutine

Purpose

Provides a service for examining or setting kernel run-time tunable parameters.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/types.h>
#include <sys/var.h>

int sys_parm ( cmd,  parmflag,  parmp)
int cmd;
int parmflag;
struct vario *parmp;
```

Description

The **sys_parm** subroutine is used to query and/or customize run-time operating system parameters.

Note: This is a replacement service for **sysconfig** with respect to querying or changing information in the **var** structure. The **audit** subroutine or command can be used to audit changes to the **var** structure.

The sys_parm subroutine:

- · Works on both 32 bit and 64 bit platforms
- · Requires appropriate privilege for its use.

The following operations are supported:

SYSP GET

SYSP_SET

Returns a structure containing the current value of the specified run-time parameter found in the var structure. Sets the value of the specfied run-time parameter.

The run-time parameters that can be returned or set are found in the var structure as defined in var.h

Parameters

cmd parmflag parmp

Specifies the SYSP_GET or SYSP_SET function. Specifies the parameter upon which the function will act. Points to the user specified structure from which or to which the system parameter value is copied. parmp points to a structure of type vario as defined in var.h.

The vario structure is an abstraction of the various fields in the var structure for which each field is size invariant. The size of the data does not depend on the execution environment of the kernel being 32 or 64 bit or the calling application being 32 or 64 bit.

Examples

1. To examine the value of v.v iostrun (collect disk usage statistics).

```
#include <sys/var.h>
#include <stdio.h>
struct vario myvar;
rc=sys parm(SYSP GET,SYSP V IOSTRUN,&myvar);
        printf("v.v iostrun is set to %d\n",myvar.v.v iostrun.value);
```

2. To change the value of v.v_iostrun (collect disk usage statistics).

```
#include <sys/var.h>
#include <stdio.h>
struct vario myvar;
myvar.v.v_iostrun.value=0; /* initialize to false */
rc=sys_parm(SYSP_SET,SYSP_V_IOSTRUN,&myvar);
if(rc==0)
        printf("disk usage statistics are not being collected\n");
```

Other parameters may be examined or set by changing the parmflag parameter.

Return Values

These operations return a value of 0 upon succesful completion of the subroutine. Otherwise or a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

EACCES EINVAL

The calling process does not have the required privilege. One of the following is true:

- The command is neither SYSP_GET nor SYSP_SET
- · parmflag is out of range of parameters defined in var.h
- The value specified in the parmp parameter is not a valid value for the field indicated by the parmflag parameter.

EFAULT

An invalid address was specified by the *parmp* parameter.

File

sys/var.h

Contains structure definitions.

Related Information

The SYS_GETPARMS ("SYS_GETPARMS sysconfig Operation" on page 375) sysconfig Operation, and SYS SETPARMS ("SYS SETPARMS sysconfig Operation" on page 382) sysconfig Operation

system Subroutine

Purpose

Runs a shell command.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h>

int system (String) const char *String;

Description

The system subroutine passes the String parameter to the sh command as input. Then the sh command interprets the String parameter as a command and runs it.

The system subroutine calls the fork subroutine to create a child process that in turn uses the exec I subroutine to run the /usr/bin/sh command, which interprets the shell command contained in the String parameter. When invoked on the Trusted Path, the system subroutine runs the Trusted Path shell (/usr/bin/tsh). The current process waits until the shell has completed, then returns the exit status of the shell. The exit status of the shell is returned in the same manner as a call to the wait or waitpid subroutine, using the structures in the sys/wait.h file.

The system subroutine ignores the SIGINT and SIGQUIT signals, and blocks the SIGCHILD signal while waiting for the command specified by the String parameter to terminate. If this might cause the application to miss a signal that would have killed it, the application should use the value returned by the system subroutine to take the appropriate action if the command terminated due to receipt of a signal. The system subroutine does not affect the termination status of any child of the calling process unless that process was created by the system subroutine. The system subroutine does not return until the child process has terminated.

Parameters

String Specifies a valid sh shell command.

Note: The **system** subroutine runs only **sh** shell commands. The results are unpredictable if the *String* parameter is not a valid **sh** shell command.

Return Values

Upon successful completion, the **system** subroutine returns the exit status of the shell. The exit status of the shell is returned in the same manner as a call to the **wait** or **waitpid** subroutine, using the structures in the **sys/wait.h** file.

If the *String* parameter is a null pointer and a command processor is available, the **system** subroutine returns a nonzero value. If the **fork** subroutine fails or if the exit status of the shell cannot be obtained, the **system** subroutine returns a value of -1. If the **exec I** subroutine fails, the system subroutine returns a value of 127. In all cases, the **errno** global variable is set to indicate the error.

Error Codes

The **system** subroutine fails if any of the following are true:

EAGAIN The system-imposed limit on the total number of running processes, either systemwide or by a single

user ID, was exceeded.

EINTR The system subroutine was interrupted by a signal that was caught before the requested process was

started. The EINTR error code will never be returned after the requested process has begun.

ENOMEM Insufficient storage space is available.

Related Information

The **sh** command.

List of Security and Auditing Subroutines, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tan, tanf, tanl, tand32, tand64, and tand128 Subroutines

Purpose

Computes the tangent.

Syntax

```
#include <math.h>
float tanf (x)
float x;
long double tanl (x)
long double x;
double tan (x)
double x;
_Decimal32 tand32 (x)
_Decimal32 x;
_Decimal64 tand64 (x)
_Decimal64 x;
_Decimal128 tand128 (x)
_Decimal128 tand128 x;
```

Description

The tan, tanf, tanl, tand32, tand64, and tand128 subroutines compute the tangent of the x parameter, measured in radians.

An application wishing to check for error situations should set the **errno** global variable to zero and call feclearexcept(FE ALL EXCEPT) before calling these functions. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

Specifies the value to be computed.

Return Values

Upon successful completion, the tan, tanf, tanl, tand32, tand64, and tand128 subroutines return the tangent of x.

If the correct value would cause underflow, and is not representable, a range error may occur, and 0.0 is returned.

If x is NaN, a NaN is returned.

If x is ± 0 , x is returned.

If x is subnormal, a range error may occur and x should be returned.

If x is $\pm Inf$, a domain error occurs, and a NaN returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value is returned.

If the correct value would cause overflow, a range error occurs and the tan, tanf, tanf, tand32, tand64, and tand128 subroutines return the value of the macro HUGE VAL, HUGE VALF, HUGE VALL, HUGE VAL D32, HUGE VAL D64, and HUGE VAL D128 respectively.

Error Codes

The tan, tanf, and tanl subroutines lose accuracy when passed a large value for the x parameter. Since the machine value of pi can only approximate its infinitely precise value, the remainder of x/(2 * pi)becomes less accurate as x becomes larger. Similar loss of accuracy occurs for the tan, tanf, and tanl subroutines during argument reduction of large arguments.

Related Information

atanf or atanl Subroutine, feclearexcept Subroutine, fetestexcept Subroutine, and class, class, finite, isnan, or unordered Subroutines in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

math.h in AIX 5L Version 5.3 Files Reference.

tanh, tanhf, tanhl, tanhd32, tanhd64, and tanhd128 Subroutines

Purpose

Computes the hyperbolic tangent.

Syntax

```
#include <math.h>
float tanhf (x)
float x;
long double tanhl(x)
long double x;
double tanh (x)
double x;
Decimal 32 tanhd32(x)
Decimal32 x;
Decimal64 tanhd64 (x)
Decimal64 x;
_Decimal128 tanhd128 (x) _Decimal128 x;
```

Description

The tanhf, tanhl, tanh, tanhd32, tanhd64, and tanhd128 subroutines compute the hyperbolic tangent of the x.

An application wishing to check for error situations should set the errno global variable to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE INVALID | FE DIVBYZERO | FE OVERFLOW | FE UNDERFLOW) is nonzero, an error has occurred.

Parameters

Specifies the value to be computed. Х

Return Values

Upon successful completion, the tanhf, tanhl, tanh, tanhd32, tanhd64, and tanhd128 subroutines return the hyperbolic tangent of x.

If x is NaN, a NaN is returned.

If x is ± 0 , x is returned.

If x is $\pm \ln f$, ± 1 is returned.

If x is subnormal, a range error may occur and x should be returned.

tcb Subroutine

Purpose

Alters the Trusted Computing Base (TCB) status of a file.

Library

Security Library (libc.a)

Syntax

```
#include <sys/tcb.h>
int tcb ( Path, Flag)
char *Path;
int Flag;
```

Description

The **tcb** subroutine provides a mechanism to query or set the TCB attributes of a file.

This subroutine is not safe for use with multiple threads. To call this subroutine from a threaded application, enclose the call with the _libs_rmutex lock. See "Making a Subroutine Safe for Multiple Threads" in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs for more information about this lock.

Parameters

Path Specifies the path name of the file whose TCB status is to be changed.

Flag

Specifies the function to be performed. Valid values are defined in the sys/tcb.h file and include the following:

TCB_ON

Enables the TCB attribute of a file.

TCB OFF

Disables the Trusted Process and TCB attributes of a file.

TCB QUERY

Queries the TCB status of a file. This function returns one of the preceding values.

Return Values

Upon successful completion, the tcb subroutine returns a value of 0 if the Flags parameter is either TCB_ON or TCB_OFF. If the Flags parameter is TCB_QUERY, the current status is returned. If the tcb subroutine fails, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **tcb** subroutine fails if one of the following is true:

The Flags parameter is not one of TCB_ON, TCB_OFF, or TCB_QUERY. EINVAL

EPERM Not authorized to perform this operation.

ENOENT The file specified by the Path parameter does not exist.

EROFS The file system is read-only.

EBUSY The file specified by the Path parameter is currently open for writing. **EACCES** Access permission is denied for the file specified by the *Path* parameter.

Security

Access Control: The calling process must have search permission for the object named by the *Path* parameter. Only the root user can set the **tcb** attributes of a file.

Related Information

The **chmod** command.

List of Security and Auditing Subroutines, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tcdrain Subroutine

Purpose

Waits for output to complete.

Library

Standard C Library (libc.a)

Syntax

#include <termios.h>

int tcdrain(FileDescriptor)
int FileDescriptor;

Description

The **tcdrain** subroutine waits until all output written to the object referred to by the *FileDescriptor* parameter has been transmitted.

Parameter

FileDescriptor Specifies an open file descriptor.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The tcdrain subroutine is unsuccessful if one of the following is true:

EBADF The *FileDescriptor* parameter does not specify a valid file descriptor.

EINTR A signal interrupted the **tcdrain** subroutine.

EIO The process group of the writing process is orphaned, and the writing process does not ignore or block

the SIGTTOU signal.

ENOTTY The file associated with the *FileDescriptor* parameter is not a terminal.

Example

To wait until all output has been transmitted, enter:

rc = tcdrain(stdout);

Related Information

tcflow Subroutine

Purpose

Performs flow control functions.

Library

Standard C Library (libc.a)

Syntax

#include <termios.h>

int tcflow(FileDescriptor, Action) int FileDescriptor; int Action;

Description

The tcflow subroutine suspends transmission or reception of data on the object referred to by the FileDescriptor parameter, depending on the value of the Action parameter.

Parameters

FileDescriptor Action

Specifies an open file descriptor. Specifies one of the following:

TCOOFF

Suspend output.

TCOON

Restart suspended output.

TCIOFF

Transmit a STOP character, which is intended to cause the terminal device to stop transmitting data to the system. See the description of IXOFF in the Input Modes section of the termios.h file.

TCION Transmit a START character, which is intended to cause the terminal device to start transmitting data to the system. See the description of IXOFF in the Input Modes section of the termios.h file.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The tcflow subroutine is unsuccessful if one of the following is true:

EBADF The FileDescriptor parameter does not specify a valid file descriptor.

EINVAL The Action parameter does not specify a proper value.

EIO The process group of the writing process is orphaned, and the writing process does not ignore or block

the SIGTTOU signal.

ENOTTY The file associated with the FileDescriptor parameter is not a terminal.

Example

To restart output from a terminal device, enter:

rc = tcflow(stdout, TCION);

Related Information

The tcdrain ("tcdrain Subroutine" on page 398) subroutine, tcflush ("tcflush Subroutine") subroutine, tcsendbreak ("tcsendbreak Subroutine" on page 403) subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tcflush Subroutine

Purpose

Discards data from the specified queue.

Library

Standard C Library (libc.a)

Syntax

#include <termios.h>

```
int tcflush( FileDescriptor, QueueSelector)
int FileDescriptor;
int QueueSelector;
```

Description

The **tcflush** subroutine discards any data written to the object referred to by the *FileDescriptor* parameter, or data received but not read by the object referred to by FileDescriptor, depending on the value of the QueueSelector parameter.

Parameters

FileDescriptor Specifies an open file descriptor. QueueSelector

Specifies one of the following:

TCIFLUSH

Flush data received but not read.

TCOFLUSH

Flush data written but not transmitted.

TCIOFLUSH

Flush both of the following:

- · Data received but not read
- · Data written but not transmitted

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **tcflush** subroutine is unsuccessful if one of the following is true:

EBADF The FileDescriptor parameter does not specify a valid file descriptor. **EINVAL** The QueueSelector parameter does not specify a proper value.

EIO The process group of the writing process is orphaned, and the writing process does not ignore or block

the SIGTTOU signal.

ENOTTY The file associated with the FileDescriptor parameter is not a terminal.

Example

To flush the output queue, enter:

rc = tcflush(2, TCOFLUSH);

Related Information

tcgetattr Subroutine

Purpose

Gets terminal state.

Library

Standard C Library (libc.a)

Syntax

#include <termios.h>

```
int tcgetattr ( FileDescriptor, TermiosPointer)
int FileDescriptor;
struct termios *TermiosPointer;
```

Description

The tcgetattr subroutine gets the parameters associated with the object referred to by the FileDescriptor parameter and stores them in the **termios** structure referenced by the *TermiosPointer* parameter. This subroutine is allowed from a background process; however, the terminal attributes may subsequently be changed by a foreground process.

Whether or not the terminal device supports differing input and output baud rates, the baud rates stored in the termios structure returned by the tcgetattr subroutine reflect the actual baud rates, even if they are egual.

Note: If differing baud rates are not supported, returning a value of 0 as the input baud rate is obsolete.

Parameters

FileDescriptor Specifies an open file descriptor. **TermiosPointer** Points to a termios structure.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **tcgetattr** subroutine is unsuccessful if one of the following is true:

EBADF The FileDescriptor parameter does not specify a valid file descriptor. **ENOTTY** The file associated with the FileDescriptor parameter is not a terminal.

Examples

To get the current terminal state information, enter:

rc = tcgetattr(stdout, &my termios);

Related Information

The tcsetattr ("tcsetattr Subroutine" on page 404) subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tcgetpgrp Subroutine

Purpose

Gets foreground process group ID.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>

pid_t tcgetpgrp (FileDescriptor)
int FileDescriptor;

Description

The **tcgetpgrp** subroutine returns the value of the process group ID of the foreground process group associated with the terminal. The function can be called from a background process; however, the foreground process can subsequently change the information.

Parameters

FileDescriptor

Indicates the open file descriptor for the terminal special file.

Return Values

Upon successful completion, the process group ID of the foreground process is returned. If there is no foreground process group, a value greater than 1 that does not match the process group ID of any existing process group is returned. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **tcgetpgrp** subroutine is unsuccessful if one of the following is true:

EBADF The *FileDescriptor* argument is not a valid file descriptor.

EINVAL The function is not appropriate for the file associated with the *FileDescriptor* argument.

ENOTTY The calling process does not have a controlling terminal or the file is not the controlling terminal.

Related Information

The **setpgid** ("setpgid or setpgrp Subroutine" on page 189) subroutine, **setsid** ("setsid Subroutine" on page 193) subroutine, **tcsetpgrp** ("tcsetpgrp Subroutine" on page 406) subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tcsendbreak Subroutine

Purpose

Sends a break on an asynchronous serial data line.

Library

Standard C Library (libc.a)

Syntax

#include <termios.h>

```
int tcsendbreak( FileDescriptor, Duration)
int FileDescriptor;
int Duration;
```

Description

If the terminal is using asynchronous serial data transmission, the tcsendbreak subroutine causes transmission of a continuous stream of zero-valued bits for a specific duration.

If the terminal is not using asynchronous serial data transmission, the tcsendbreak subroutine returns without taking any action.

Pseudo-terminals and LFT do not generate a break condition. They return without taking any action.

Parameters

FileDescriptor Specifies an open file descriptor.

Specifies the number of milliseconds that zero-valued bits are transmitted. If the value of **Duration**

> the Duration parameter is 0, it causes transmission of zero-valued bits for at least 250 milliseconds and not longer than 500 milliseconds. If Duration is not 0, it sends

zero-valued bits for Duration milliseconds.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The tcsendbreak subroutine is unsuccessful if one or both of the following are true:

EBADF The FileDescriptor parameter does not specify a valid open file descriptor.

EIO The process group of the writing process is orphaned, and the writing process does not ignore or block

the SIGTTOU signal.

ENOTTY The file associated with the *FileDescriptor* parameter is not a terminal.

Examples

1. To send a break condition for 500 milliseconds, enter:

```
rc = tcsendbreak(stdout,500);
```

2. To send a break condition for 25 milliseconds, enter:

```
rc = tcsendbreak(1,25);
```

This could also be performed using the default *Duration* by entering:

```
rc = tcsendbreak(1, 0);
```

Related Information

tcsetattr Subroutine

Purpose

Sets terminal state.

Library

Standard C Library (libc.a)

Syntax

```
#include <termios.h>
```

```
int tcsetattr (FileDescriptor, OptionalActions, TermiosPointer)
int FileDescriptor, OptionalActions;
const struct termios * TermiosPointer;
```

Description

The tcsetattr subroutine sets the parameters associated with the object referred to by the FileDescriptor parameter (unless support required from the underlying hardware is unavailable), from the termios structure referenced by the TermiosPointer parameter.

The value of the *OptionalActions* parameter determines how the **tcsetattr** subroutine is handled.

The 0 baud rate (B0) is used to terminate the connection. If B0 is specified as the output baud rate when the tcsetattr subroutine is called, the modem control lines are no longer asserted. Normally, this disconnects the line.

Using 0 as the input baud rate in the termios structure to cause tcsetattr to change the input baud rate to the same value as that specified by the value of the output baud rate, is obsolete.

If an attempt is made using the tcsetattr subroutine to set:

- · An unsupported baud rate
- · Baud rates, such that the input and output baud rates differ and the hardware does not support that combination
- · Other features not supported by the hardware

but the tcsetattr subroutine is able to perform some of the requested actions, then the subroutine returns successfully, having set all supported attributes and leaving the above unsupported attributes unchanged.

If no part of the request can be honored, the **tcsetattr** subroutine returns a value of -1 and the **errno** global variable is set to **EINVAL**.

If the input and output baud rates differ and are a combination that is not supported, neither baud rate is changed. A subsequent call to the tcgetattr subroutine returns the actual state of the terminal device (reflecting both the changes made and not made in the previous tcsetattr call). The tcsetattr subroutine does not change the values in the termios structure whether or not it actually accepts them.

If the tcsetattr subroutine is called by a process which is a member of a background process group on a FileDescriptor associated with its controlling terminal, a SIGTTOU signal is sent to the background process group. If the calling process is blocking or ignoring SIGTTOU signals, the process performs the operation and no signal is sent.

Parameters

Specifies an open file descriptor. FileDescriptor

OptionalActions Specifies one of the following values:

TCSANOW

The change occurs immediately.

TCSADRAIN

The change occurs after all output written to the object referred to by FileDescriptor has been transmitted. This function should be used when changing parameters that affect output.

TCSAFLUSH

The change occurs after all output written to the object referred to by FileDescriptor has been transmitted. All input that has been received but not read is discarded before the change is made.

TermiosPointer Points to a termios structure.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The **tcsetattr** subroutine is unsuccessful if one of the following is true:

EBADF The FileDescriptor parameter does not specify a valid file descriptor.

EINTR A signal interrupted the **tcsetattr** subroutine.

EINVAL The OptionalActions argument is not a proper value, or an attempt was made to change an attribute

represented in the termios structure to an unsupported value.

EIO The process group of the writing process is orphaned, and the writing process does not ignore or block

the SIGTTOU signal.

ENOTTY The file associated with the *FileDescriptor* parameter is not a terminal.

Example

To set the terminal state after the current output completes, enter:

rc = tcsetattr(stdout, TCSADRAIN, &my_termios);

Related Information

The cfgetispeed subroutine, tcgetattr ("tcgetattr Subroutine" on page 401) subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tcsetpgrp Subroutine

Purpose

Sets foreground process group ID.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>

```
int tcsetpgrp (FileDescriptor, ProcessGroupID)
int FileDescriptor;
pid t ProcessGroupID;
```

Description

If the process has a controlling terminal, the tcsetpgrp subroutine sets the foreground process group ID associated with the terminal to the value of the ProcessGroupID parameter. The file associated with the FileDescriptor parameter must be the controlling terminal of the calling process, and the controlling terminal must be currently associated with the session of the calling process. The value of the ProcessGroupID parameter must match a process group ID of a process in the same session as the calling process.

Parameters

FileDescriptor Specifies an open file descriptor. **ProcessGroupID** Specifies the process group identifier.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

This function is unsuccessful if one of the following is true:

EBADF The FileDescriptor parameter is not a valid file descriptor.

EINVAL The *ProcessGroupID* parameter is invalid.

ENOTTY The calling process does not have a controlling terminal, or the file is not the controlling terminal, or the

controlling terminal is no longer associated with the session of the calling process.

EPERM The ProcessGroupID parameter is valid, but does not match the process group ID of a process in the

same session as the calling process.

Related Information

The tcgetpgrp ("tcgetpgrp Subroutine" on page 402) subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

termdef Subroutine

Purpose

Queries terminal characteristics.

Library

Standard C Library (libc.a)

Syntax

```
char *termdef ( FileDescriptor, Characteristic)
int FileDescriptor;
char Characteristic;
```

Description

The termdef subroutine returns a pointer to a null-terminated, static character string that contains the value of a characteristic defined for the terminal specified by the FileDescriptor parameter.

Asynchronous Terminal Support

Shell profiles usually set the **TERM** environment variable each time you log in. The **stty** command allows you to change the lines and columns (by using the lines and cols options). This is preferred over changing the LINES and COLUMNS environment variables, since the termdef subroutine examines the environment variables last. You consider setting LINES and COLUMNS environment variables if:

 You are using an asynchronous terminal and want to override the lines and cols setting in the terminfo database

Your asynchronous terminal has an unusual number of lines or columns and you are running an application that uses the **termdef** subroutine but not an application which uses the **terminfo** database (for example, curses).

This is because the curses initialization subroutine, **setupterm** ("setupterm Subroutine" on page 702), calls the **termdef** subroutine to determine the number of lines and columns on the display. If the termdef subroutine cannot supply this information, the setupterm subroutine uses the values in the terminfo database.

Parameters

FileDescriptor Characteristic

Specifies an open file descriptor.

Specifies the characteristic that is to be queried. The following values can be specified:

- Causes the **termdef** subroutine to query for the number of "columns" for the terminal. This is determined by performing the following actions:
 - 1. It requests a copy of the terminal's winsize structure by issuing the TIOCGWINSZ ioctl. If ws_col is not 0, the ws_col value is used.
 - 2. If the TIOCGWINSZ ioctl is unsuccessful or if ws col is 0, the termdef subroutine attempts to use the value of the COLUMNS environment variable.
 - 3. If the COLUMNS environment variable is not set, the termdef subroutine returns a pointer to a null string.
- ı Causes the termdef subroutine to guery for the number of "lines" (or rows) for the terminal. This is determined by performing the following actions:
 - 1. It requests a copy of the terminal's winsize structure by issuing the TIOCGWINSZ ioctl. If ws_row is not 0, the ws_row value is used.
 - 2. If the TIOCGWINSZ ioctl is unsuccessful or if ws row is 0, the termdef subroutine attempts to use the value of the LINES environment variable.
 - 3. If the **LINES** environment variable is not set, the **termdef** subroutine returns a pointer to a null string.

Characters other than c or I

Cause the **termdef** subroutine to query for the "terminal type" of the terminal. This is determined by performing the following actions:

- 1. The **termdef** subroutine attempts to use the value of the **TERM** environment variable.
- 2. If the TERM environment variable is not set, the termdef subroutine returns a pointer to string set to "dumb".

Examples

1. To display the terminal type of the standard input device, enter:

```
printf("%s\n", termdef(0, 't'));
```

2. To display the current lines and columns of the standard output device, enter:

```
printf("lines\tcolumns\n%s\t%s\n", termdef(2, 'l'),
    termdef(2, 'c'));
```

Note: If the termdef subroutine is unable to determine a value for lines or columns, it returns pointers to null strings.

Related Information

The **setupterm** ("setupterm Subroutine" on page 702) subroutine.

The stty command.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

test_and_set Subroutine

Purpose

Atomically tests and sets a memory location.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/atomic op.h>
boolean_t test_and_set (word_addr, mask)
atomic p word addr;
int mask;
```

Description

The **test and set** subroutine attempts to atomically OR the value stored at word addr with the value specified by mask. If any bit in mask was already set in the value stored at word addr, no update is made.

Parameters

word_addr Specifies the address of the memory location to be set.

Specifies the mask value to be used to set the memory location specified by word_addr. mask

Return Values

The test_and_set subroutine returns true if the the value stored at word_addr was updated. Otherwise, it returns false.

The fetch_and_and or fetch_and_or Subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

tgamma, tgammaf, tgammal, tgammad32, tgammad64, and tgammad128 Subroutines

Purpose

Computes the gamma.

Syntax

```
#include <math.h>
double tgamma (x)
double x;
float tgammaf (x)
float x;
long double tgammal (x)
long double x;
_Decimal32 tgammad32 (x)
_Decimal32 x;
_Decimal64 tgammad64 (x)
Decimal64 x;
Decimal 128 tgammad 128 (x)
Decimal 128 x;
```

Description

The tgamma, tgammaf, tgammal, tgammad32, tgammad64, and tgammad128 subroutines compute the **gamma** function of x.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these subroutines. Upon return, if errno is nonzero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is nonzero, an error has occurred.

Parameters

х

Specifies the value to be computed.

Return Values

Upon successful completion, the tgamma, tgammaf, tgammal, tgammad32, tgammad64, and **tgammad128** subroutines return **Gamma**(x).

If x is a negative integer, a domain error occurs, and either a NaN (if supported), or an implementation-defined value is returned.

If the correct value would cause overflow, a range error occurs and the tgamma, tgammaf, tgammal, tgammad32, tgammad64, and tgammad128 subroutines return the value of the macro HUGE VAL, HUGE_VALF, HUGE_VALL, HUGE_VAL_D32, HUGE_VAL_D64, or HUGE_VAL_D128 respectively.

If x is NaN, a NaN is returned.

If x is +Inf, x is returned.

If x is ± 0 , a pole error occurs, and the tgamma, tgammal, tgammal, tgammad32, tgammad64, and tgammad128 subroutines return ±HUGE VAL, ±HUGE VALF, ±HUGE VALL, ±HUGE VAL D32, ±HUGE_VAL_D64, or ±HUGE_VAL_D128 respectively.

If x is -Inf, a domain error occurs, and either a NaN (if supported), or an implementation-defined value is returned.

Related Information

math.h in AIX 5L Version 5.3 Files Reference.

timer_create Subroutine

Purpose

Creates a per process timer.

Library

Standard C Library (libc.a)

Syntax

#include <time.h> int timer_create (clock_id, evp, timerid) clockid_t clock id; struct sigevent *evp; timer t *timerid;

Description

The **timer create** subroutine creates a per-process timer using the specified clock, *clock id*, as the timing base. The timer create subroutine returns, in the location referenced by timerid, a timer ID of type timer t used to identify the timer in timer requests. This timer ID is unique within the calling process until the timer is deleted. The particular clock, clock id, is defined in the time.h file. The timer whose ID is returned is in a disarmed state upon return from the timer create subroutine.

The evp parameter, if non-NULL, points to a sigevent structure. This structure, allocated by the application, defines the asynchronous notification that will occur when the timer expires. If the evp parameter is NULL, the effect is as if the evp parameter pointed to a sigevent structure with the sigev_notify member having the value SIGEV_SIGNAL, the sigev_signo member having the **SIGALARM** default signal number, and the **sigev value** member having the value of the timer ID.

This system defines a set of clocks that can be used as timing bases for per-process timers. Supported values for the *clock id* parameter are the following:

CLOCK_REALTIME CLOCK MONOTONIC The system-wide realtime clock.

The system-wide monotonic clock. The value of this clock represents the amount of time since an unspecified point in the past. It cannot be set through the clock_settime subroutine and cannot have backward clock jumps.

CLOCK PROCESS CPUTIME ID

The process CPU-time clock of the calling process. The value of this clock represents the amount of execution time of the process associated with the clock.

The thread CPU-time clock of the calling thread. The value of this clock represents the amount of execution time of the thread associated with this clock.

The **timer_create** subroutine fails if the value defined for the *clock_id* parameter corresponds to:

- · The CPU-time clock of a process that is different than the process calling the function
- The thread CPU-time clock of a thread that is different than the thread calling the function.

Parameters

clock_id Specifies the clock to be used.

Points to a sigevent structure that defines the asynchronous notification. evp

timerid Points to the location where the timer ID is returned.

Return Values

If the timer_create subroutine succeeds, 0 is returned, and the location referenced by the timerid parameter is updated to a timer_t, which can be passed to the per-process timer calls. If an error occurs, -1 is returned and **errno** is set to indicate the error.

Error Codes

The timer create subroutine will fail if:

EAGAIN The system lacks sufficient signal queuing resources to honor the request. **EAGAIN** The calling process has already created all of the timers it is allowed.

The specified clock ID is not defined. **EINVAL**

ENOTSUP The implementation does not support the creation of a timer attached to the CPU-time clock

that is specified by the *clock_id* parameter and associated with a process or a thread that is

different from the process or thread calling timer_create.

ENOTSUP The function is not supported with checkpoint-restart processes.

clock_getres in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume

timer delete Subroutine

Purpose

Deletes a per process timer.

Library

Standard C Library (libc.a)

Syntax

#include <time.h>

int timer delete (timerid) timer_t timerid;

Description

The timer_delete subroutine deletes the specified timer, timerid, that was previously created by the timer_create subroutine. If the timer is armed when the timer_delete subroutine is called, the timer is automatically disarmed before removal.

Parameters

timerid

Specifies the timer ID.

Return Values

If successful, the timer_delete subroutine returns a value of zero. Otherwise, the subroutine returns a value of -1 and sets errno to indicate the error.

Error Codes

The timer delete subroutine fails if:

EINVAL The timerid parameter is not a valid timer ID.

ENOTSUP The function is not supported with checkpoint-restart processes.

Related Information

"timer create Subroutine" on page 411.

timer_getoverrun, timer_gettime, and timer_settime Subroutine

Purpose

Per-process timers.

Library

Standard C Library (libc.a)

Syntax

```
#include <time.h>
int timer_getoverrun (timerid)
timer_t timerid;
int timer_gettime (timerid, value)
timer t timerid;
struct itimerspec *value;
int timer_settime (timerid, flags, value, ovalue)
timer t timerid;
int f\overline{l}ags;
const struct itimerspec *value;
struct itimerspec *ovalue;
```

Description

The timer_gettime subroutine stores the amount of time until the specified timer, timerid, expires, and stores the reload value of the timer into the space pointed to by the value parameter. The it value member of the structure contains the amount of time before the timer expires, or zero if the timer is

disarmed. This value is returned as the interval until the timer expires, even if the timer was armed with absolute time. The it interval member of the value parameter contains the reload value last set by the timer settime subroutine.

The timer_settime subroutine sets the time until the next expiration of the timer specified by the timerid parameter and arms the timer if the it value member of the value parameter is nonzero. If the specified timer is armed when the timer_settime subroutine is called, the call resets the time until next expiration to the value specified. If the **it value** member of the *value* parameter is zero, the timer is disarmed.

If the TIMER_ABSTIME flag is not set in the flags parameter, the timer_settime subroutine behaves as if the time until next expiration is set to be equal to the interval specified by the it value member of the value parameter. That is, the timer expires in it value nanoseconds from when the call is made. If the TIMER_ABSTIME flag is set in the flags parameter, the timer_settime subroutine behaves as if the time until next expiration is set to be equal to the difference between the absolute time specified by the it_value member and the current value of the clock associated with the timerid parameter. That is, the timer expires when the clock reaches the value specified by the it value member. If the specified time has already passed, the subroutine succeeds and the expiration notification is made.

The reload value of the timer is set to the value specified by the it interval member of the value parameter. When a timer is armed with a nonzero it interval, a periodic (or repetitive) timer is specified.

Time values that are between two consecutive non-negative integer multiples of the resolution of the specified timer is rounded up to the larger multiple of the resolution. Quantization error does not cause the timer to expire earlier than the rounded time value.

If the ovalue parameter is not NULL, the timer_settime subroutine stores a value representing the previous amount of time before the timer would have expired, or zero if the timer was disarmed, together with the previous timer reload value. Timers do not expire before their scheduled time.

Only a single signal is queued to the process for a given timer at any point in time. When a timer for which a signal is still pending expires, no signal is queued, and a timer overrun occurs.

Concerning timers based on thread CPU-time clocks, the timer_gettime and timer_settime subroutines can only be called with timerid referencing a timer based on the thread CPU-time clock of the calling thread. In other words, a thread cannot manipulate the thread CPU-time timers created by other threads in the same process.

Parameters

timerid Specifies the timer ID.

value Points to an itimerspec structure containing the time value.

flags Specifies the flags that are set.

Specifies the location of the value representing the previous amount of time before the timer would have ovalue

expired, or zero if the timer was disarmed.

Return Values

If the **timer getoverrun** subroutine succeeds, it returns the timer expiration overrun count.

If the **timer_gettime** or timer_settime subroutines succeed, 0 is returned.

If an error occurs for any of these subroutines, -1 is returned and errno is set to indicate the error.

Error Codes

The timer_getoverrun, timer_gettime, and timer_settime subroutines fail if:

EINVAL The timerid parameter does not correspond to an ID returned by the timer_create subroutine but not

vet deleted by the timer delete subroutine.

ENOTSUP The function is not supported with checkpoint-restart processes.

The timer_gettime and timer_settime subroutines fail if:

EINVAL The timerid parameter corresponds to a timer based on the thread CPU-time clock of a thread

different from the thread calling timer_gettime or timer_settime. The timer has not been created by

this thread.

The timer_settime subroutine fails if:

EINVAL The value parameter specified a nanosecond value less than zero or greater than or equal to 1000 million, and the it_value member of the structure did not specify zero seconds and nanoseconds.

Related Information

"timer_create Subroutine" on page 411.

clock_getres in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume

times Subroutine

Purpose

Gets process and waited-for child process times

Syntax

#include <sys/times.h> clock_t times (buffer) struct tms *buffer;

Description

The **times** subroutine fills the **tms** structure pointed to by *buffer* with time-accounting information. The **tms** structure is defined in <sys/times.h>.

All times are measured in terms of the number of clock ticks used.

The times of a terminated child process is included in the tms_cutime and tms_cstime elements of the parent when the wait or waitpid subroutine returns the process ID of the terminated child. If a child process has not waited for its children, their times are not included in its times.

- The tms_utime structure member is the CPU time charged for the execution of user instructions of the calling process.
- The tms_stime structure member is the CPU time charged for execution by the system on behalf of the calling process.
- The tms cutime structure member is the sum of the tms utime and tms cutime times of the child processes.

 The tms cstime structure member is the sum of the tms stime and tms cstime times of the child processes.

Applications should use sysconf (SC CLK TCK) to determine the number of clock ticks per second as it may vary from system to system.

Parameters

*buffer

Points to the tms structure.

Return Values

Upon successful completion, the times subroutine returns the elapsed real time, in clock ticks, since an arbitrary point in the past (for example, system startup time). This point does not change from one invocation of the times subroutine within the process to another. The return value may overflow the possible range of type clock t. If the times subroutine fails, (clock t)-1 is returned, and the errno global variable is set to indicate the error.

Examples

Timing a Database Lookup

The following example defines two functions, **start_clock** and **end_clock**, that are used to time a lookup. It also defines variables of type clock_t and tms to measure the duration of transactions. The start_clock function saves the beginning times given by the times subroutine. The end_clock function gets the ending times and prints the difference between the two times.

```
#include <sys/times.h>
#include <stdio.h>
void start clock(void);
void end clock(char *msg);
static clock t st time;
static clock t en time;
static struct tms st cpu;
static struct tms en cpu;
void
start clock()
{
        st time = times(&st cpu);
/* This example assumes that the result of each subtraction is within the range of values that can
       be represented in an integer type. */
void
end_clock(char *msg)
{
        en time = times(&en cpu);
        fputs(msg,stdout);
        printf("Real Time: %jd, User Time %jd, System Time %jd\n",
              (intmax t) (en time - st time),
              (intmax t)(en cpu.tms utime - st cpu.tms utime),
              (intmax t)(en cpu.tms stime - st cpu.tms stime));
```

timezone Subroutine

Attention: Do not use the tzset subroutine, when linking the libc.a and libbsd.a libraries. The tzset subroutine uses the timezone global external variable that conflicts with the timezone subroutine in the libbsd.a library. This name collision can cause unpredictable results.

Purpose

Returns the name of the time zone that is associated with the first parameter.

Library

Berkeley compatibility library (libbsd.a) (for the timezone subroutine only)

Syntax

```
#include <time.h>
char *timezone(zone, dst)
int zone;
int dst;
#include <time.h>
#include <limits.h>
int zone;
int dst;
```

Description

The **timezone** subroutine returns the name of the time zone that is associated with the *zone* parameter. The zone parameter is measured in minutes westward from Greenwich. If the TZ environment variable is set, the zone parameter is ignored, and the current time zone is calculated from the value of the TZ environment variable. If the value of the dst parameter is 0, the standard name is returned; otherwise the name of daylight saving time is returned. If the TZ environment variable is not set, the internal table is searched for a matching time zone. If the time zone does not appear in the built in table, the difference from GMT is produced.

The **timezone** subroutine returns a pointer to static data, which will be overwritten by subsequent calls.

Parameters

Specifies minutes westward from Greenwich. zone

dst Specifies whether to return standard time or daylight saving time.

Return Values

The timezone subroutine returns a pointer to the czone global variable, which contains the name of the time zone.

Subroutines Overview

List of Multi-threaded Programming Subroutines

thread_post Subroutine

Purpose

Posts a thread of an event completion.

Library

Standard C library (libc.a)

Syntax

#include <sys/thread.h>

int thread post(tid) tid_t tid;

Description

The thread_post subroutine posts the thread whose thread ID is indicated by the value of the tid parameter, of the occurrence of an event. If the posted thread is waiting in thread wait, it will be awakened immediately. If it not waiting in thread wait, the next call to thread wait does not block but returns with success immediately.

Multiple posts to the same thread without an intervening wait by the specified thread will only count as a single post. The posting remains in effect until the indicated thread calls the thread_wait subroutine upon which the posting gets cleared.

The thread_wait and the thread_post subroutine can be used by applications to implement a fast IPC mechanism between threads in different processes.

Parameters

tid

Specifies the thread ID of the thread to be posted.

Return Values

On successful completion, the thread post subroutine returns a value of 0. If unsuccessful, a value of -1 is returned and the global variable errno is set to indicate the error.

Error Codes

ESRCH

This indicated thread is non-existent or the thread has exited or is exiting.

EPERM

The real or effective user ID does not match the real or effective user ID of the thread being posted, or else the calling process does not have root user authority.

Related Information

The thread_wait ("thread_wait Subroutine" on page 421) subroutine, and thread_post_many ("thread_post_many Subroutine" on page 419) subroutine.

thread_post_many Subroutine

Purpose

Posts one or more threads of an event completion.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/thread.h>
int thread post many( nthreads, tidp, erridp)
int nthreads;
tid t * tidp;
tid_t * erridp;
```

Description

The thread post many subroutine posts one or more threads of the occurrence of the event. The number of threads to be posted is specified by the value of the *nthreads* parameter, while the *tidp* parameter points to an array of thread IDs of threads that need to be posted. The subroutine works just like the thread_post subroutine but can be used to post to multiple threads at the same time.

A maximum of 512 threads can be posted in one call to the **thread post many** subroutine.

An optional address to a thread ID field may be passed in the erridp parameter. This field is normally ignored by the kernel unless the subroutine fails because the calling process has no permissions to post to any one of the specified threads. In this case, the kernel posts all threads in the array pointed at by the tidp parameter up to the first failing thread and fills the erridp parameter with the failing thread's ID.

Parameters

nthreads	Specifies the number of threads to be posted.
tidp	Specifies the address of an array of thread IDs
	corresponding to the list of threads to be posted.
erridp	Either NULL or specifies the pointer to a thread ID
	variable in which the kernel will return the thread ID of the
	first failing thread when an errno of EPERM is set.

Return Values

On successful completion, the thread_post_many subroutine returns a value of 0. If unsuccessful, a value of -1 is returned and the global variable errno is set to indicate the error.

Error Codes

The **thread_post_many** subroutine is unsuccessful when one of the following is true:

ESRCH None of the indicated threads are existent or they have all exited or are exiting. **EPERM** The real or effective user ID does not match the real or effective user ID of one or more threads being posted, or else the calling process does not have root user authority. **EFAULT** The tidp parameter points to a location outside of the address space of the process.

Related Information

The thread_wait ("thread_wait Subroutine" on page 421) subroutine, and thread_post ("thread_post Subroutine" on page 418) subroutine.

thread_self Subroutine

Purpose

Returns the caller's kernel thread ID.

Library

Standard C library (libc.a)

Syntax

#include <sys/thread.h> tid_t thread_self ()

Description

The thread_self subroutine returns the caller's kernel thread ID. The kernel thread ID may be useful for the bindprocessor and ptrace subroutines. The ps, trace, and vmstat commands also report kernel thread IDs, thus this subroutine can be useful for debugging multi-threaded programs.

The kernel thread ID is unrelated with the thread ID used in the threads library (libpthreads.a) and returned by the pthread self subroutine.

Return Values

The thread_self subroutine returns the caller's kernel thread ID.

Related Information

The bindprocessor subroutine, pthread_self subroutine, ptrace subroutine.

thread_setsched Subroutine

Purpose

Changes the scheduling policy and priority of a kernel thread.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/sched.h>
#include <sys/pri.h>
#include <sys/types.h>
int thread_setsched ( tid, priority, policy)
```

tid_t tid; int priority; int policy;

Description

The thread_setsched subroutine changes the scheduling policy and priority of a kernel thread. User threads (pthreads) have their own scheduling attributes that in some cases allow a pthread to execute on top of multiple kernel threads. Therefore, if the policy or priority change is being granted on behalf of a pthread, then the pthreads contention scope should be PTHREAD_SCOPE_SYSTEM.

Note: Caution must be exercised when using the thread setsched subroutine, since improper use may result in system hangs. See sys/pri.h for restrictions on thread priorities.

Parameters

Specifies the kernel thread ID of the thread whose priority and policy are to be changed. tid

Specifies the priority to use for this kernel thread. The priority parameter is ignored if the policy is priority

being set to SCHED_OTHER. The priority parameter must have a value in the range 0 to PRI_LOW.

PRI_LOW is defined in sys/pri.h. See sys/pri.h for more information on thread priorities.

policy Specifies the policy to use for this kernel thread. The policy parameter can be one of the following

values, which are defined in sys/sched.h:

SCHED_OTHER

Default operating system scheduling policy.

SCHED FIFO

First in-first out scheduling policy.

SCHED FIFO2

Allows a thread that sleeps for a relatively short amount of time to be requeued to the head, rather than the tail, of its priority run queue.

SCHED FIFO3

Causes threads to be enqueued to the head of their run queues.

SCHED RR

Round-robin scheduling policy.

Return Values

Upon successful completion, the thread_setsched subroutine returns a value of zero. If the thread_setsched subroutine is unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The thread_setsched subroutine is unsuccessful if one or more of the following is true:

ESRCH The kernel thread id tid is invalid. EINVAL The policy or priority is invalid.

EPERM The caller does not have enough privilege to change the policy or priority.

thread wait Subroutine

Purpose

Suspends the thread until it receives a post or times out.

Library

Standard C library (libc.a)

Syntax

#include <sys/thread.h>

int thread_wait(timeout) int timeout;

Description

The thread_wait subroutine allows a thread to wait or block until another thread posts it with the thread_post or the thread_post_many subroutine or until the time limit specified by the timeout value expires. It returns immediately if there is a pending post for this thread or if a timeout value of 0 is specified.

If the event for which the thread is waiting and for which it will be posted will occur only in the future, the thread wait subroutine may be called with a timeout value of 0 to clear any pending posts.

The thread_wait and the thread_post subroutine can be used by applications to implement a fast IPC mechanism between threads in different processes.

Parameters

timeout

Specifies the maximum length of time, in milliseconds, to wait for a posting. If the timeout parameter value is -1, the thread_wait subroutine does not return until a posting actually occurs. If the value of the timeout parameter is 0, the thread_wait subroutine does not wait for a post to occur but returns immediately, even if there are no pending posts. For a non-privileged user, the minimum timeout value is 10 msec and any value less than that is automatically increased to 10 msec.

Return Values

On successful completion, the thread wait subroutine returns a value of 0. The thread wait subroutine completes successfully if there was a pending post or if the calling thread was posted before the time limit specified by the timeout parameter expires.

A return value of THREAD WAIT TIMEDOUT indicates that the thread wait subroutine timed out.

If unsuccessful, a value of -1 is returned and the global variable errno is set to indicate the error.

Error Codes

The thread_wait subroutine is unsuccessful when one of the following is true:

EINTR This subroutine was terminated by receipt of a signal. ENOMEM There is not enough memory to allocate a timer

Related Information

The thread post ("thread post Subroutine" on page 418) subroutine, and thread post many ("thread_post_many Subroutine" on page 419) subroutine.

tmpfile Subroutine

Purpose

Creates a temporary file.

Library

Standard C Library (libc.a)

Syntax

#include <stdio.h>
FILE *tmpfile ()

Description

The **tmpfile** subroutine creates a temporary file and opens a corresponding stream. The file is opened for update. The temporary file is automatically deleted when all references (links) to the file have been closed.

The stream refers to a file which has been unlinked. If the process ends in the period between file creation and unlinking, a permanent file may remain.

Return Values

The **tmpfile** subroutine returns a pointer to the stream of the file that is created if the call is successful. Otherwise, it returns a null pointer and sets the **errno** global variable to indicate the error.

Error Codes

The **tmpfile** subroutine fails if one of the following occurs:

EINTR A signal was caught during the **tmpfile** subroutine.

EMFILE The number of file descriptors currently open in the calling process is already equal to **OPEN_MAX**.

ENFILE The maximum allowable number of files is currently open in the system.

ENOSPEC The directory or file system which would contain the new file cannot be expanded.

Related Information

The **fopen**, **freopen**, **fdopen** subroutines, **mktemp** subroutine, **tmpnam** or **tempnam** ("tmpnam or tempnam Subroutine") subroutine, **unlink** ("unlink Subroutine" on page 495) subroutine.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tmpnam or tempnam Subroutine

Purpose

Constructs the name for a temporary file.

Library

Standard C Library (libc.a)

```
#include <stdio.h>
char *tmpnam ( String)
char *String;
char *tempnam ( Directory, FileXPointer)
const char *Directory, *FileXPointer;
```

Description

Attention: The tmpnam and tempnam subroutines generate a different file name each time they are called. If called more than 16,384 (TMP_MAX) times by a single process, these subroutines recycle previously used names.

The **tmpnam** and the **tempnam** subroutines generate file names for temporary files. The **tmpnam** subroutine generates a file name using the path name defined as P tmpdir in the stdio.h file.

Files created using the tmpnam subroutine reside in a directory intended for temporary use. The file names are unique. The application must create and remove the file.

The **tempnam** subroutine enables you to define the directory. The *Directory* parameter points to the name of the directory in which the file is to be created. If the *Directory* parameter is a null pointer or points to a string that is not a name for a directory, the path prefix defined as P_tmpdir in the stdio.h file is used. For an application that has temporary files with initial letter sequences, use the FileXPointer parameter to define the sequence. The FileXPointer parameter (a null pointer or a string of up to 5 bytes) is used as the beginning of the file name.

Between the time a file name is created and the file is opened, another process can create a file with the same name. Name duplication is unlikely if the other process uses these subroutines or the mktemp subroutine, and if the file names are chosen to avoid duplication by other means.

Parameters

String	Specifies the address of an array of at least the number of bytes specified by L_tmpnam, a
	constant defined in the stdio.h file.

If the String parameter has a null value, the tmpnam subroutine places its result into an internal static area and returns a pointer to that area. The next call to this subroutine destroys

the contents of the area. If the String parameter's value is not null, the tmpnam subroutine places its results into the

specified array and returns the value of the String parameter. Points to the path name of the directory in which the file is to be created.

The **tempnam** subroutine controls the choice of a directory. If the *Directory* parameter is a

null pointer or points to a string that is not a path name for an appropriate directory, the path name defined as P tmpdir in the stdio.h file is used. If that path name is not accessible, the /tmp directory is used. You can bypass the selection of a path name by providing an environment variable, TMPDIR, in the user's environment. The value of the TMPDIR

environment variable is a path name for the desired temporary-file directory.

A pointer to an initial character sequence with which the file name begins. The FileXPointer parameter value can be a null pointer, or it can point to a string of characters to be used as the first characters of the temporary-file name. The number of characters allowed is file

system dependent, but 5 bytes is the maximum allowed.

FileXPointer

Directory

Return Values

Upon completion, the **tempnam** subroutine allocates space for the string using the **malloc** subroutine, puts the generated path name in that space, and returns a pointer to the space. Otherwise, it returns a null pointer and sets the errno global variable to indicate the error. The pointer returned by tempnam may be used in the free subroutine when the space is no longer needed.

Error Codes

The **tempnam** subroutine returns the following error code if unsuccessful:

ENOMEM Insufficient storage space is available.

ENINVAL Indicates an invalid string value.

Related Information

The fopen, freopen, fdopen subroutine, malloc, free, realloc, calloc, mallopt, mallinfo, or alloca subroutine, mktemp or mkstemp subroutine, openx, open, creat subroutine, tmpfile ("tmpfile Subroutine" on page 423) subroutine, unlink ("unlink Subroutine" on page 495) subroutine.

towctrans Subroutine

Purpose

Character transliteration.

Library

Standard library (libc.a)

Syntax

```
#include <wctvpe.h>
wint_t towctrans (wint_t wc, wctrans_t desc);
```

Description

The **towctrans** function transliterates the wide-character code we using the mapping described by desc. The current setting of the LC CTYPE category should be the same as during the call to wctrans that returned the value desc. If the value of desc is invalid (that is, not obtained by a call to wctrans or desc is invalidated by a subsequent call to setlocale that has affected category LC_CTYPE) the result is implementation-dependent.

Return Values

If successful, the towctrans function returns the mapped value of wc using the mapping described by desc. Otherwise it returns we unchanged.

Error Codes

The towctrans function may fail if:

EINVAL desc contains an invalid transliteration descriptor.

Related Information

The towlower ("towlower Subroutine") subroutine, towupper ("towupper Subroutine" on page 427) subroutine, wctrans ("wctrans Subroutine" on page 545) subroutine.

The wctype.h file.

towlower Subroutine

Purpose

Converts an uppercase wide character to a lowercase wide character.

Library

Standard C Library (libc.a)

Syntax

#include <wchar.h>

wint t towlower (WC) wint t WC;

Description

The towlower subroutine converts the uppercase wide character specified by the WC parameter into the corresponding lowercase wide character. The LC CTYPE category affects the behavior of the towlower subroutine.

Parameters

WC Specifies the wide character to convert to lowercase.

Return Values

If the WC parameter contains an uppercase wide character that has a corresponding lowercase wide character, that wide character is returned. Otherwise, the WC parameter is returned unchanged.

Related Information

The **iswalnum** subroutine, **iswalpha** subroutine, **iswcntrl** subroutine, **iswctype** subroutine, **iswdigit** subroutine, iswgraph subroutine, iswlower subroutine, iswprint subroutine, iswpunct subroutine, iswspace subroutine, iswupper subroutine, iswxdigit subroutine, setlocale ("setlocale Subroutine" on page 180) subroutine, towupper ("towupper Subroutine" on page 427) subroutine, wctype ("wctype or get wctype Subroutine" on page 545) subroutine.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

National Language Support Overview and Wide Character Classification Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

towupper Subroutine

Purpose

Converts a lowercase wide character to an uppercase wide character.

Library

Standard C Library (libc.a)

Syntax

#include <wchar.h>

wint t towupper (WC) wint t WC;

Description

The towupper subroutine converts the lowercase wide character specified by the WC parameter into the corresponding uppercase wide character. The LC CTYPE category affects the behavior of the towupper subroutine.

Parameters

Specifies the wide character to convert to uppercase.

Return Values

If the WC parameter contains a lowercase wide character that has a corresponding uppercase wide character, that wide character is returned. Otherwise, the WC parameter is returned unchanged.

Related Information

The iswalnum subroutine, iswalpha subroutine, iswcntrl subroutine, iswctype subroutine, iswdigit subroutine, iswgraph subroutine, iswlower subroutine, iswprint subroutine, iswpunct subroutine, iswspace subroutine, iswupper subroutine, iswxdigit subroutine, setlocale ("setlocale Subroutine" on page 180) subroutine, towlower ("towlower Subroutine" on page 426) subroutine, wctype ("wctype or get wctype Subroutine" on page 545) subroutine.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

t rcvreldata Subroutine

Purpose

Receive an orderly release indication or confirmation containing user data.

Library

Syntax

```
#include <xti.h>
int t rcvreldata(
    int fd.
   struct t_discon *discon)
```

Description

This function is used to receive an orderly release indication for the incoming direction of data transfer and to retrieve any user data sent with the release. The argument fd identifies the local transport endpoint where the connection exists, and **discon** points to a **t discon** structure containing the following members:

```
struct netbuf udata:
int reason;
int sequence;
```

After receipt of this indication, the user may not attempt to receive more data via t rcv or t rcvv ("t rcvv Subroutine" on page 429). Such an attempt will fail with t error set to [TOUTSTATE]. However, the user may continue to send data over the connection if t_sndrel or t_sndreldata ("t_sndreldata Subroutine" on page 436) has not been called by the user.

The field reason specifies the reason for the disconnection through a protocol-dependent reason code, and udata identifies any user data that was sent with the disconnection; the field sequence is not used.

If a user does not care if there is incoming data and does not need to know the value of reason, discon may be a null pointer, and any user data associated with the disconnection will be discarded.

If discon->udata.maxlen is greater than zero and less than the length of the value, t rcvreldata fails with t_errno set to [TBUFOVFLW].

This function is an optional service of the transport provider, only supported by providers of service type T_COTS_ORD. The flag T_ORDRELDATA in the *info->flag* field returned by **t_open** or **t_getinfo** indicates that the provider supports orderly release user data; when the flag is not set, this function behaves as t_rcvrel and no user data is returned.

This function may not be available on all systems.

Parameters	Before call	After call
fd	X	/
discon->	udata.maxlen	X
discon->	udata.len	/
discon->	udata.buf	?
discon->	reason	/
discon->	sequence	/

Valid States

T_DATAXFER, T_OUTREL

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and t_errno is set to indicate an error.

Error Codes

On failure, the **t_errno** subroutine is set to one of the following:

TBADF

The specified file descriptor does not refer to a transport endpoint.

TBUFOVFLW

The number of bytes allocated for incoming data (maxlen) is greater than 0 but not sufficient to store the data, and the disconnection information to be returned in discon will be discarded. The provider state, as seen by the user, will be changed as if the data was successfully retrieved.

TLOOK

An asynchronous event has occurred on this transport endpoint and requires immediate attention.

TNOREL

No orderly release indication currently exists on the specified transport endpoint.

TNOTSUPPORT

Orderly release is not supported by the underlying transport provider.

TOUTSTATE

The communications endpoint referenced by fd is not in one of the states in which a call to this function is valid.

TPROTO

This error indicates that a communication problem has been detected between XTI and the transport provider for which there is no other suitable XTI error (t errno).

TSYSERR

A system error has occurred during execution of this function.

Related Information

The t getinfo, t open, t sndreldata ("t sndreldata Subroutine" on page 436), t rcvrel, t sndrel subroutines.

t rcvv Subroutine

Purpose

Receive data or expedited data sent over a connection and put the data into one or more non-contiguous buffers.

Library

libxti.*

Syntax

```
#include <xti.h>
```

```
int t rcvv (int fd, struct t iovec *iov, unsigned int iovcount, int *flags);
```

Description

This function receives either normal or expedited data. The argument fd identifies the local transport endpoint through which data will arrive, iov points to an array of buffer address/buffer size pairs (iov_base, iov len). The t rcvv function receives data into the buffers specified by iov[0].iov base, iov[1].iov base, through iov[iovcount-1].iov base, always filling one buffer before proceding to the next.

Note: The limit on the total number of bytes available in all buffers passed (that is, iov(0).iov len + . . + iov(iovcount-1).iov len) may be constrained by implementation limits. If no other constraint applies, it will be limited by [INT MAX]. In practice, the availability of memory to an application is likely to impose a lower limit on the amount of data that can be sent or received using scatter/gather functions.

The argument *iovcount* contains the number of buffers which is limited to T IOV MAX (an implementation-defined value of at least 16). If the limit is exceeded, the function will fail with [TBADDATA].

The argument flags may be set on return from t_rcvv and specifies optional flags as described below.

By default, t rcvv operates in synchronous mode and will wait for data to arrive if none is currently available. However, if O NONBLOCK is set (via t open or fcntl, t rcvv will execute in asynchronous mode and will fail if no data is available (see [TNODATA] below).

On return from the call, if T_MORE is set in flags, this indicates that there is more data, and the current transport service data unit (TSDU) or expedited transport service data unit (ETSDU) must be received in multiple t rcvv or t rcv calls. In the asynchronous mode, or under unusual conditions (for example, the arrival of a signal or T EXDATA event), the T MORE flag may be set on return from the t rcvv call even when the number of bytes received is less than the total size of all the receive buffers. Each t rcvv with the T_MORE flag set indicates that another t_rcvv must follow to get more data for the current TSDU. The end of the TSDU is identified by the return of a t rcvv call with the T MORE flag not set. If the transport provider does not support the concept of a TSDU as indicated in the info argument on return from t open ort getinfo, the T MORE flag is not meaningful and should be ignored. If the amount of buffer space passed in iov is greater than zero on the call to t rcvv, then t rcvv will return 0 only if the end of a TSDU is being returned to the user.

On return, the data is expedited if T EXPEDITED is set in flags. If T MORE is also set, it indicates that the number of expedited bytes exceeded nbytes, a signal has interrupted the call, or that an entire ETSDU was not available (only for transport protocols that support fragmentation of ETSDUs). The rest of the ETSDU will be returned by subsequent calls to t rcvv which will return with T EXPEDITED set in flags. The end of the ETSDU is identified by the return of a t_rcvv call with T_EXPEDITED set and T_MORE cleared. If the entire ETSDU is not available it is possible for normal data fragments to be returned between the initial and final fragments of an ETSDU.

If a signal arrives, t_rcvv returns, giving the user any data currently available. If no data is available, t rcvv returns -1, sets t errno to [TSYSERR] and errno to [EINTR]. If some data is available, t rcvv returns the number of bytes received and T_MORE is set in flags.

In synchronous mode, the only way for the user to be notified of the arrival of normal or expedited data is to issue this function or check for the T_DATA or T_EXDATA events using the t_look function. Additionally, the process can arrange to be notified via the EM interface.

Parameters	Before call	After call
fd	X	/
iov	X/	
iovcount	X	/
iov[0].iov_base	X(/)	=(X)
iov[0].iov_len	X	=
iov[iovcount-1].iov_base	X(/)	=(X)
iov[iovcount-1].iov_len	X	=

Return Values

On successful completion, t_rcvv returns the number of bytes received. Otherwise, it returns -1 on failure and t_errno is set to indicate the error.

Error Codes

On failure, **t_errno** is set to one of the following:

TBADDATA iovcount is greater than T IOV MAX.

TBADF The specified file descriptor does not refer to a transport endpoint.

TLOOK An asynchronous event has occurred on this transport endpoint and requires immediate

attention.

TNODATA O_NONBLOCK was set, but no data is currently available from the transport provider.

TNOTSUPPORT This function is not supported by the underlying transport provider.

TOUTSTATE The communications endpoint referenced by fd is not in one of the states in which a call to this

function is valid.

TPROTO This error indicates that a communication problem has been detected between XTI and the

transport provider for which there is no other suitable XTI error (t_errno).

TSYSERR A system error has occurred during execution of this function.

t rcvvudata Subroutine

Purpose

Receive a data unit into one or more noncontiguous buffers.

Library

Standard library (libxti.a)

Syntax

```
#include <xti.h>
 int t_rcvvudata (
     int fd,
                struct t_unitdata *unitdata,
                                              struct t_iovec *iov,
                                                                                                     int *flags)
                                                                          unsigned int iovcount,
```

Description

This function is used in connectionless mode to receive a data unit from another transport user. The argument fd identifies the local transport endpoint through which data will be received, unitdata holds information associated with the received data unit, iovcount contains the number of non-contiguous udata buffers which is limited to T IOV MAX (an implementation-defined value of at least 16), and flags is set on return to indicate that the complete data unit was not received. If the limit on iovcount is exceeded, the function fails with [TBADDATA]. The argument unitdata points to a t unitdata structure containing the following members:

```
struct netbuf addr;
struct netbuf opt;
struct netbuf udata;
```

The maxlen field of addr and opt must be set before calling this function to indicate the maximum size of the buffer for each. The udata field of t_unitdata is not used. The iov_len and iov_base fields of iov[0]

through iov[iovcount-1] must be set before calling t rcvvudata to define the buffer where the userdata will be placed. If the maxlen field of addr or opt is set to zero then no information is returned in the buf field for this parameter.

On return from this call, addr specifies the protocol address of the sending user, opt identifies options that were associated with this data unit, and iov[0].iov base through iov[iovcount-1]. iov base contains the user data that was received. The return value of t_rcvvudata is the number of bytes of user data given to the user.

Note: The limit on the total number of bytes available in all buffers passed (that is, iov(0).iov_len + . . + iov(iovcount-1).iov_len) may be constrained by implementation limits. If no other constraint applies, it will be limited by [INT_MAX]. In practice, the availability of memory to an application is likely to impose a lower limit on the amount of data that can be sent or received using scatter/gather functions.

By default, t rcvvudata operates in synchronous mode and waits for a data unit to arrive if none is currently available. However, if O NONBLOCK is set (via t open or fcntl), t rcvvudata executes in asynchronous mode and fails if no data units are available. If the buffers defined in the iov[] array are not large enough to hold the current data unit, the buffers will be filled and T MORE will be set in flags on return to indicate that another t rcvvudata should be called to retrieve the rest of the data unit. Subsequent calls to t rcvvudata will return zero for the length of the address and options, until the full data unit has been received.

Parameters	Before call	After call
fd	X	/
unitdata->addr.maxlen	X	=
unitdata->addr.len	/	X
unitdata->addr.buf	?(/)	=(/)
unitdata->opt.maxlen	X	=
unitdata->opt.len	/	X
unitdata->opt.buf	?(/)	=(?)
unitdata->udata.maxlen	/	=
unitdata->udata.len	/	=
unitdata->udata.buf	/	=
iov[0].iov_base	X	=(X)
iov[0].iov_len	X	=
iov[iovcount-1].iov_base	X(/)	=(X)
iov[iovcount-1].iov_len	X	=
iovcoun	X	/
flags	/	/

Return Values

On successful completion, t_rcvvudata returns the number of bytes received. Otherwise, it returns -1 on failure and **t errno** is set to indicate the error.

Error Codes

On failure, **t_errno** is set to one of the following:

TBADDATA iovcount is greater than T_IOV_MAX.

TBADF The specified file descriptor does not refer to a transport endpoint.

TBUFOVFLW The number of bytes allocated for the incoming protocol address or options (maxlen) is greater

than 0 but not sufficient to store the information. The unit data information to be returned in

unitdata will be discarded.

TLOOK An asynchronous event has occurred on this transport endpoint and requires immediate

attention.

TNODATA O_NONBLOCK was set, but no data units are currently available from the transport provider.

TNOTSUPPORT This function is not supported by the underlying transport provider.

The communications endpoint referenced by fd is not in one of the states in which a call to this **TOUTSTATE**

function is valid.

This error indicates that a communication problem has been detected between XTI and the **TPROTO**

transport provider for which there is no other suitable XTI error (t_errno).

TSYSERR A system error has occurred during execution of this function.

The fcntl subroutine, t_alloc subroutine, t_open subroutine, t_rcvudata subroutine, t_rcvuderr subroutine, **t_sndudata** subroutine, **t_sndvudata** ("t_sndvudata Subroutine" on page 437) subroutine.

t_sndv Subroutine

Purpose

Send data or expedited data, from one or more non-contiguous buffers, on a connection.

Library

Standard library (libxti.a)

Syntax

#include <xti.h>

int t sndv (int fd, const struct t iovec *iov, unsigned it iovcount, int flags)

Description

Parameters	Before call	After call
fd	X	/
iovec	X	/
iovcount	X	/
iov[0].iov_base	X(X)	/
iov[0].iov_len	X	/
iov[iovcount-1].iov_base	X(X)	/
iov[iovcount-1].iov_len	X	=
flags	X	/

This function is used to send either normal or expedited data. The argument fd identifies the local transport endpoint over which data should be sent, iov points to an array of buffer address/buffer length pairs. t_sndv sends data contained in buffers iov[0], iov[1], through iov[iovcount-1]. iovcount contains the number of non-contiguous data buffers which is limited to T IOV MAX (an implementation-defined value of at least 16). If the limit is exceeded, the function fails with [TBADDATA].

Note: The limit on the total number of bytes available in all buffers passed (that is: iov(0).iov_len + . . + iov(iovcount-1).iov len) may be constrained by implementation limits. If no other constraint applies, it will be limited by [INT_MAX]. In practice, the availability of memory to an application is likely to impose a lower limit on the amount of data that can be sent or received using scatter/gather functions.

The argument **flags** specifies any optional flags described below:

T EXPEDITED

If set in flags, the data will be sent as expedited data and will be subject to the interpretations of the transport provider.

T MORE

If set in **flags**, this indicates to the transport provider that the transport service data unit (TSDU) (or expedited transport service data unit ETSDU) is being sent through multiple t sndv calls. Each t sndv with the T MORE flag set indicates that another t sndv (or t snd) will follow with more data for the current TSDU (or ETSDU).

The end of the TSDU (or ETSDU) is identified by a t sndv call with the T MORE flag not set. Use of T MORE enables a user to break up large logical data units without losing the boundaries of those units at the other end of the connection. The flag implies nothing about how the data is packaged for transfer below the transport interface. If the transport provider does not support the concept of a TSDU as indicated in the info argument on return from t_open ort_getinfo, the T MORE flag is not meaningful and will be ignored if set.

The sending of a zero-length fragment of a TSDU or ETSDU is only permitted where this is used to indicate the end of a TSDU or ETSDU, that is, when the T MORE flag is not set. Some transport providers also forbid zero-length TSDUs and ETSDUs. See Appendix A for a fuller explanation.

If set in flags, requests that the provider transmit all data that it has accumulated but not sent. The request is a local action on the provider and does not affect any similarly named protocol flag (for example, the TCP PUSH flag). This effect of setting this flag is protocol-dependent, and it may be ignored entirely by transport providers which do not support the use of this feature.

Note: The communications provider is free to collect data in a send buffer until it accumulates a sufficient amount for transmission.

By default, t_sndv operates in synchronous mode and may wait if flow control restrictions prevent the data from being accepted by the local transport provider at the time the call is made. However, if O_NONBLOCK is set (via t_open or fcntl), t_sndv executes in asynchronous mode, and will fail immediately if there are flow control restrictions. The process can arrange to be informed when the flow control restrictions are cleared via either t look or the EM interface.

On successful completion, **t sndv** returns the number of bytes accepted by the transport provider. Normally this will equal the total number of bytes to be sent, that is,

```
(iov[0].iov len + . . + iov[iovcount-1].iov len)
```

However, the interface is constrained to send at most INT_MAX bytes in a single send. When t_sndv has submitted INT_MAX (or lower constrained value, see the note above) bytes to the provider for a single call, this value is returned to the user. However, if O_NONBLOCK is set or the function is interrupted by a signal, it is possible that only part of the data has actually been accepted by the communications provider. In this case, t sndv returns a value that is less than the value of nbytes. If t sndv is interrupted by a signal before it could transfer data to the communications provider, it returns -1 with t errno set to [TSYSERR] and errno set to [EINTR].

If the number of bytes of data in the iov array is zero and sending of zero octets is not supported by the underlying transport service, **t sndv** returns -1 with t errno set to [TBADDATA].

The size of each TSDU or ETSDU must not exceed the limits of the transport provider as specified by the current values in the TSDU or ETSDU fields in the info argument returned by t_getinfo.

The error [TLOOK] is returned for asynchronous events. It is required only for an incoming disconnect event but may be returned for other events.

Return Values

On successful completion, t_sndv returns the number of bytes accepted by the transport provider. Otherwise, -1 is returned on failure and t errno is set to indicate the error.

- 1. In synchronous mode, if more than INT MAX bytes of data are passed in the iov array, only the first INT MAX bytes will be passed to the provider.
- 2. If the number of bytes accepted by the communications provider is less than the number of bytes requested, this may either indicate that O NONBLOCK is set and the communications provider is blocked due to flow control, or that O NONBLOCK is clear and the function was interrupted by a signal.

Error Codes

On failure, t errno is set to one of the following:

TBADDATA Illegal amount of data:

- A single send was attempted specifying a TSDU (ETSDU) or fragment TSDU (ETSDU) greater than that specified by the current values of the TSDU or ETSDU fields in the info argument.
- A send of a zero byte TSDU (ETSDU) or zero byte fragment of a TSDU (ETSDU) is not supported by the provider.
- Multiple sends were attempted resulting in a TSDU (ETSDU) larger than that specified by the current value of the TSDU or ETSDU fields in the info argument the ability of an XTI implementation to detect such an error case is implementation-dependent (see CAVEATS, below).
- iovcount is greater than T IOV MAX.

TBADF The specified file descriptor does not refer to a transport endpoint.

TBADFLAG An invalid flag was specified.

TFLOW O NONBLOCK was set, but the flow control mechanism prevented the transport provider from

accepting any data at this time.

An asynchronous event has occurred on this transport endpoint. TLOOK **TNOTSUPPORT** This function is not supported by the underlying transport provider.

TOUTSTATE The communications endpoint referenced by fd is not in one of the states in which a call to this

function is valid.

TPROTO This error indicates that a communication problem has been detected between XTI and the

transport provider for which there is no other suitable XTI error (t_errno).

A system error has occurred during execution of this function. **TSYSERR**

t sndreldata Subroutine

Purpose

Initiate/respond to an orderly release with user data.

Library

Syntax

#include <xti.h>

int t_sndreldata(int fd, struct t_discon *discon)

Description

This function is used to initiate an orderly release of the outgoing direction of data transfer and to send user data with the release. The argument fd identifies the local transport endpoint where the connection exists, and **discon** points to a **t discon** structure containing the following members:

```
struct netbuf udata;
int reason:
int sequence;
```

After calling t sndreldata, the user may not send any more data over the connection. However, a user may continue to receive data if an orderly release indication has not been received.

The field reason specifies the reason for the disconnection through a protocol-dependent reason code, and udata identifies any user data that is sent with the disconnection; the field sequence is not used.

The udata structure specifies the user data to be sent to the remote user. The amount of user data must not exceed the limits supported by the transport provider, as returned in the **discon** field of the *info* argument of t_open or t_getinfo. If the len field of udata is zero or if the provider did not return T_ORDRELDATA in the t_open flags, no data will be sent to the remote user.

If a user does not wish to send data and reason code to the remote user, the value of discon may be a null pointer.

This function is an optional service of the transport provider, only supported by providers of service type T_COTS_ORD. The flag T_ORDRELDATA in the info->flag field returned by t_open or t_getinfo indicates that the provider supports orderly release user data; when the flag is not set, this function behaves as t rcvrel and no user data is returned.

This function may not be available on all systems.

Parameters	Before call	After call
fd	X	/
discon->	udata.maxlen	/
discon->	udata.len	X
discon->	udata.buf	?(?)
discon->	reason	?
discon->	sequence	/

Valid States

T DATAXFER, T INREL

Error Codes

On failure, **t_errno** is set to one of the following:

[TBADDATA]

The amount of user data specified was not within the bounds allowed by the transport provider, or user data was supplied and the provider did not return T ORDRELDATA in the t open flags.

[TBADF]

The specified file descriptor does not refer to a transport endpoint.

[TFLOW]

O_NONBLOCK was set, but the flow control mechanism prevented the transport provider from accepting the function at this time.

[TLOOK]

An asynchronous event has occurred on this transport endpoint and requires immediate attention.

[TNOTSUPPORT]

Orderly release is not supported by the underlying transport provider.

[TOUTSTATE]

The communications endpoint referenced by fd is not in one of the states in which a call to this function is valid.

[TPROTO]

This error indicates that a communication problem has been detected between XTI and the transport provider for which there is no other suitable XTI error (t_errno).

[TSYSERR]

A system error has occurred during execution of this function.

Return Value

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and t errno is set to indicate an error.

Related Information

The t_getinfo, t_open, t_rcvreldata ("t_rcvreldata Subroutine" on page 427), t_rcvrel, and t_sndrel subroutines.

t_sndvudata Subroutine

Purpose

Send a data unit from one or more noncontiguous buffers.

Library

Syntax

```
#include <xti.h>
int t sndvudata(
    int fd,
   struct t unitdata *unitdata,
   struct t_iovec *iov,
   unsigned int iovcount)
```

Description

This function is used in connectionless mode to send a data unit to another transport user. The argument fd identifies the local transport endpoint through which data will be sent, iovcount contains the number of non-contiguous udata buffers and is limited to an implementation-defined value given by T_IOV_MAX, which is at least 16, and unitdata points to a t_unitdata structure containing the following members:

```
struct netbuf addr;
struct netbuf opt;
struct netbuf udata;
```

If the limit on iovcount is exceeded, the function fails with [TBADDATA].

In unitdata, addr specifies the protocol address of the destination user, and opt identifies options that the user wants associated with this request. The udata field is not used. The user may choose not to specify what protocol options are associated with the transfer by setting the len field of opt to zero. In this case, the provider may use default options.

The data to be sent is identified by **iov[0]** through **iov[iovcount-1**].

```
The limit on the total number of bytes available in all buffers passed (that is:
iov(0).iov len + . . + iov(iovcount-1).iov len )
```

may be constrained by implementation limits. If no other constraint applies, it will be limited by [INT MAX]. In practice, the availability of memory to an application is likely to impose a lower limit on the amount of data that can be sent or received using scatter/gather functions.

By default, t sndvudata operates in synchronous mode and may wait if flow control restrictions prevent the data from being accepted by the local transport provider at the time the call is made. However, if O NONBLOCK is set (via t open or fcntl, t sndvudata executes in asynchronous mode and will fail under such conditions. The process can arrange to be notified of the clearance of a flow control restriction via either t look or the EM interface.

If the amount of data specified in iov[0] through iov[iovcount-1] exceeds the TSDU size as returned in the tsdu field of the info argument of t_open or t_getinfo, or is zero and sending of zero octets is not supported by the underlying transport service, a [TBADDATA] error is generated. If t sndvudata is called before the destination user has activated its transport endpoint (see t_bind), the data unit may be discarded.

If it is not possible for the transport provider to immediately detect the conditions that cause the errors [TBADDADDR] and [TBADOPT], these errors will alternatively be returned by t rcvuderr. An application must therefore be prepared to receive these errors in both of these ways.

Parameters	Before call	After call
fd	X	/
unitdata->	addr.maxlen	/
unitdata->	addr.len	X
unitdata->	addr.buf	x(x)
unitdata->	opt.maxlen	/
unitdata->	opt.len	X
unitdata->	opt.buf	?(?)
unitdata->	udata.maxlen	/
unitdata->	udata.len	/
unitdata->	udata.buf	/
iov[0].iov_base	x(x)	=(=)
left>iov[0].iov_len	X	=

Parameters	Before call	After call
iov[iovcount-1].iov_base	x(x)	=(=)
iov[iovcount-1].iov_len	X	=
iovcount	X	/

Valid States

T IDLE

Error Codes

On failure, t_errno is set to one of the following:

[TBADADDR] The specified protocol address was in an incorrect format or contained illegal information. [TBADDATA] Illegal amount of data.

• A single send was attempted specifying a TSDU greater than that specified in the *info* argument, or a send of a zero byte TSDU is not supported by the provider.

• iovcount is greater than T_IOV_MAX.

[TBADF] The specified file descriptor does not refer to a transport endpoint.

TBADOPT The specified options were in an incorrect format or contained illegal information.

[TFLOW] O_NONBLOCK was set, but the flow control mechanism prevented the transport provider

from accepting any data at this time.

[TLOOK] An asynchronous event has occurred on this transport endpoint.

[TNOTSUPPORT] This function is not supported by the underlying transport provider.

[TOUTSTATE] The communications endpoint referenced by fd is not in one of the states in which a call to

this function is valid.

[TPROTO] This error indicates that a communication problem has been detected between XTI and the

transport provider for which there is no other suitable XTI error (t_errno).

[TSYSERR] A system error has occurred during execution of this function.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and **t_errno** is set to indicate an error.

The fcntl, t_alloc, t_open, t_rcvudata, t_rcvvudata ("t_rcvvudata Subroutine" on page 431), t_rcvuderr, t sndudata subroutines.

t_sysconf Subroutine

Purpose

Get configurable XTI variables.

Library

Standard library (libxti.a)

Syntax

#include <xti.h>

int t_sysconf (int name)

Description

Parameters	Before call	After call
name	X	/

The t sysconf function provides a method for the application to determine the current value of configurable and implementation-dependent XTI limits or options.

The name argument represents the XTI system variable to be queried. The following table lists the minimal set of XTI system variables from xti.h that can be returned by t sysconf, and the symbolic constants, defined in xti.h that are the corresponding values used for name.

Var	riable	Value of Name
T_I	OV_MAX	_SC_T_IOV_MAX

Return Values

If name is valid, t_sysconf returns the value of the requested limit/option (which might be -1) and leaves t_errno unchanged. Otherwise, a value of -1 is returned and t_errno is set to indicate an error.

Error Codes

On failure, t errno is set to the following:

TBADFLAG name has an invalid value.

Related Information

trc close Subroutine

Purpose

Closes and frees a trace log object.

Library

libtrace.a

Syntax

#include <sys/libtrace.h>

int trc close (handle) trc_log_handle_t handle;

Description

The trc_close subroutine closes a trace log object. The object must have been opened with the trc_open subroutine. If the TRC_RETAIN_HANDLE type was specified at open time, the trc_close subroutine must be called after a call to the trc_open subroutine, regardless of whether the open succeeded or not.

Parameters

handle

Contains the handle returned from a successful call to the trc_open subroutine.

Return Values

Upon successful completion, the trc close subroutine returns a 0.

Error Codes

Upon error, the trc close subroutine sets the errno global variable and returns the error from the fclose subroutine. In addition, EINVAL is returned if handle contains an invalid trc log handle t object.

trc find first, trc find next, and trc compare Subroutine

Purpose

Finds the first, or next, occurrence of the argument, or compares the current entry with the argument.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
int trc_find_first (handle, argp, ret)
trc_log_handle_t handle;
trc logsearch t *arap;
trc read t *ret;
int trc find next (handle, argp, ret)
trc log handle t handle;
trc_logsearch_t *argp;
trc_read_t *ret;
int trc compare (handle, argp)
trc_log_handle_t handle;
trc_logsearch_t *argp;
```

Description

The trc_find_first subroutine finds the first occurrence of the trace log entry matching the argument pointed to by the argp parameter. The trc find next subroutine finds the next occurrence of the argument starting from the current position in the log object. If the search argument pointer, argp, is NULL, the argument from the previous search is used. Both the trc find first and trc find next subroutines return the item found. If the handle.s flag field contains both TRC MULTI MERGE and TRC REMOVE DUPS,

trc find first and trc find next will consume any duplicate entries of the current event that exist from other trace sources. The number of entries consumed will be returned in the trchi dupcount or trcri_dupcount variable (depending on whether processed or raw data items, respectively, are requested).

The trc_compare subroutine is used to check the current entry against the argument. No data is read. It is useful when implementing exit criteria, where you need to find entries according to some criteria, but then check for an exit criteria which is not part of the normal search.

Parameters

handle Contains the handle returned from a successful call to the **trc_open** subroutine.

Points to the argument list as defined in the /usr/include/sys/libtrace.a file. Arguments may be argp

chained together to perform complex searches.

ret Points to the trc read t structure to be returned. The trc free subroutine should be used to free

data referenced from the trc_read_t data type, unless TRC_LOGLIVE was specified at open time.

The search argument consists of three parts, the operator, tls_op, and the left and right sides.

The operator values can be easily identified, because they have the form TLS 0P Operators are split into two categories, leaf and compound operators. Leaf operators are operators that compare the field on the left with the value on the right. Compound operators are used to compare two expressions, (for example) to combined expressions.

Leaf operations may be performed using numeric or string data. If performed on string data, the **strcmp** libc string compare function is used to do the comparison for all operators except TLS OP SUBSTR. The valid leaf operators are:

TLS OP EQUAL Exactly equal TLS OP NE Not equal TLS_OP_LT Less than

TLS_OP_LE Less than or equal TLS_OP_GT Greater than

TLS OP GE Greater than or equal

TLS OP SUBSTR The string on the left contains the string on the right.

The compound operators are:

TLS_OP_AND The logical AND of the results of the left and right

expressions.

TLS_OP_OR The logical OR of the results of the left and right

expressions.

TLS_OP_XOR The exclusive or of the results of the left and right

expressions.

TLS_OP_NOT The negation of the argument referenced by tls_left.

The left and right sides of the expression are defined as follows:

tls_left and tls_right These are used when the operator requires the left and

right sides to be an expression, (for example) when it is a compound operator. tls_left and tls_right point to other

trc_logsearch_t structures.

For a leaf operation, tls_field, on the left, specifies the field to be compared. The field names can be identified easily, because they all have the form TLS_MATCH_.... The righthand side is a value specified according to the data type of the field on the left.

The following table shows the lefthand field values and their corresponding righthand side data values:

Field	Value	Description
TLS_MATCH_HOOKID	tls_shortvalue	Compare the hookid with a short data item.
TLS_MATCH_HOOK_AND_SUBHOOK	tls_intvalue	Compare the hook and subhook, 28 bits, with the specified integer.Note that the field is of the form 0x0hhhssss, where hhh is the hook id, and ssss is the subhook.
TLS_MATCH_HOOKSET	tls_hooksetvalue	The bit map specifying the hooks to be tested for. This allows you to test for multiple hooks with one search argument. The bit map is manipulated with the trc_hkemptyset, trc_hkfillset, trc_hkaddset, and trc_hkdelset subroutines.
TLS_MATCH_TIME	tls_longvalue	Compare the time value in nanoseconds from the start of the trace.
TLS_MATCH_TID	tls_longvalue	Thread id
TLS_MATCH_PID	tls_longvalue	Process id
TLS_MATCH_RAWOFST	tls_longvalue	Raw file offset
TLS_MATCH_CPUID	tls_intvalue	cpu id
TLS_MATCH_RCPU	tls_intvalue	Remaining cpus in the trace.
TLS_MATCH_FLAGS	tls_intvalue	Compare with trcr_flags
TLS_MATCH_INTR_DEPTH	tls_intvalue	Compare with trchi_intr_depth
TLS_MATCH_PROCNAME	tls_strvalue	Process name
TLS_MATCH_SVCNAME	tls_strvalue	svc name
TLS_MATCH_PRI	tls_intvalue	Dispatch priority
TLS_MATCH_TICKS	tls_longvalue	Match with the number of timer register ticks since the start of the trace.
TLS_MATCH_DATA	tls_strvalue	Compare string with the ascii data, trchi_ascii
TLS_MATCH_FILENAME	tls_strvalue	Compare with trchi_filename
TLS_MATCH_TRCONTIME	tls_longvalue	Compare with trchi_trcontime
TLS_MATCH_TRCOFFTIME	tls_longvalue	Compare with trchi_trcofftime

Return Values

Upon successful completion, the trc_find_first, trc_find_next, and trc_compare subroutines return 0.

Error Codes

Upon error, the errno global variable is set to a value from the errno.h file. The trc find first, trc_find_next, and trc_compare subroutines return either a value from the errno.h file, or an error value from the libtrace.h file.

EINVAL The handle is invalid, or the search argument is invalid.

TRCE EOF No matching item was found, or no more matching items exist. The errno global variable

is set to 0.

TRCE_BADFORMAT The log object contains badly formatted data. The errno global variable is set to EINVAL.

Examples

1. Find the SVC hooks, 101 and 104, for program mypgm. { int rv; trc_loghandle_t h; trc read t r; trc logsearch t t1, t2, t3, t4, t5; /* Setup the leaf search arguments. */ t1.tls_op = TLS OP EQUAL; t1.tls field = TLS MATCH HOOKID; t1.tls shortvalue = 0x101; t2.tls op = TLS OP EQUAL; t2.tls field = TLS MATCH HOOKID; $t2.tls_shortvalue = 0x10\overline{4};$ t3.tls op = TLS OP EQUAL; t3.tls field = TLS MATCH PROCNAME; t3.tls strvalue = "mypgm"; /* Join the items and form a single search tree. */ t4.tls op = TLS OP AND; t4.tls left = &t1 $t4.tls_right = &t2$ t5.tls_op = TLS_OP_AND; t5.tls left = &t4 t5.tls right = &t3/* Open the default trace log object. */ rv = trc open("", "", TRC LOGREAD|TRC LOGPROC, >h); if (rv) { trc perror(h, rv, "open"); return(rv); /* Do the search. */ rv = trc find first(h, &t5, &r); if (rv) { trc perror(h, rv, "find test"); return(rv); }

Note that subsequent entries matching this search could be returned with the following:

```
rv = trc find next(h, NULL, &r);
```

After a find, trc find next can be used to change the search argument without starting the search over. In other words, trc find first always starts from the beginning of the file, while trc find next starts from the current position in the file, but either one can change the search argument.

2. Find the SVC hooks, 101 and 104, for program mypgm. Use a single argument to search for both hook ids.

```
int rv;
trc_loghandle_t h;
trc_read_t r;
trc logsearch t t1, t2, t3;
trc hookset t hs;
/* Setup the hook set. */
trc hkemptyset(hs);
(void)trc_hkaddset(hs, 0x101);
(void)trc_hkaddset(hs, 0x104);
/* Setup the leaf search arguments. */
t1.tls op = TLS OP EQUAL;
t1.tls_field = TLS_MATCH_HOOKSET;
t1.tls hooksetvalue = hs;
t2.tls op = TLS OP EQUAL;
t2.tls_field = TLS_MATCH PROCNAME;
t2.tls strvalue = "mypgm";
/* Join the items and form a single search tree. */
t3.tls_op = TLS_OP_AND;
t3.tls\_left = \&t1
t3.tls right = &t2
/* Open the default trace log object. */
rv = trc_open("", "", TRC_LOGREAD|TRC_LOGPROC, &h);
if (rv) {
        trc perror(h, rv, "open");
        return(rv);
/* Do the search. */
rv = trc_find_first(h, &t3, &r);
if (rv) \overline{\{}
        trc perror(h, rv, "find test");
        return(rv);
```

trc free Subroutine

Purpose

Frees memory allocated by the trc_read, trc_find, trc_loginfo, or trc_hookname subroutine.

Library

libtrace.a

#include <sys/libtrace.h>

int trc free (parmp) void *parmp;

Description

The trc_free subroutine is used to free memory associated with data structures returned by the trace retrieval API. It does not free the storage for the base structure, however, only storage allocated by the API on behalf of the user. The pointer must point to one of the following:

trc read t

Data returned by the trc_read or trc_find subroutine.

trc_loginfo_t

Data returned by the **trc_loginfo** subroutine.

trc_hookname_t

Data returned by the **trc_hookname** subroutine.

trc_logpos_t

A log position object returned by the trc_tell subroutine.

A log handle, trc loghandle t, must be freed using the trc close subroutine.

For example, trc free(&trc data), where trc data is of type trc read t, frees the storage referenced by the trc data structure, but does not free trc data since it must be pre-allocated by the user.

Parameters

parmp

Points to a structure as described above.

Return Values

Upon successful completion, the trc_free subroutine returns 0.

Error Codes

EINVAL

The parmp parameter points to an unsupported data type.

trc hkemptyset, trc hkfillset, trc hkaddset, trc hkdelset, and trc hkisset Subroutine

Purpose

Manipulates a trace hook set.

Library

libtrace.a

```
#include <sys/libtrace.h>
void trc hkemptyset(hookset)
trc_hookset_t hookset;
void trc hkfillset(hookset)
trc_hookset_t hookset;
int trc_hkaddset(hookset, hook)
trc_hookset_t hookset;
short hook;
int trc_hkdelset(hookset, hook)
trc_hookset_t hookset;
short hook;
int trc_hkisset (hookset, hook)
trc_hookset_t hookset;
short hook
```

Description

These subroutines manipulate a trace hook set used by the trc_find subroutines. This hook set can be used to search for several trace hooks simultaneously.

Parameters

hookset References the hook set to be operated on. hook Specifies a hook value in the range 0x000 - 0xfff.

Return Values

The trc_hkaddset, trc_hkdelset, and trc_hkisset subroutines return EINVAL if the hook is out of range (that is, greater than 0xfff).

The trc_hkaddset subroutine returns 0 if the hook wasn't in the set, and -1 if it was already present.

The trc_hkdelset subroutine returns 0 if the hook was in the set, and -1 if it wasn't present.

The trc_hkisset subroutine returns 0 if the hook isn't present, and -1 if it is present.

Related Information

"trc loginfo Subroutine" on page 451 and "trc find first, trc find next, and trc compare Subroutine" on page 441.

trc hookname Subroutine

Purpose

Returns one or all hooks and associated names from the template file.

Library

libtrace.a

```
#include <sys/libtrace.h>
int trc hookname (handle, hook, hooknamep)
trc log handle t handle;
trc hookid t hook;
trc_hookname_t *hooknamep;
```

Description

The trc hookname subroutine returns one or more hook ids and their associated descriptions. This allows a trace data formatter to provide a hook selection list with some descriptive text for each hook.

Parameters

handle Contains a trc_log_handle_t data item returned from a successful call to the trc_open

subroutine.

hook Contains a hook id of the form 0xhhh where hhh is the 3-hex-digit hook id. If the hook parameter

is TRC_HOOK_ALL, the names for all hooks in the template file are returned.

Points to a trc_hookname_t structure. The trc_free subroutine should be used to free any data hooknamep

referenced by the trc_hookname_t data item.

```
/* Array element type for hook ids and names. */
   typedef struct {
        trc_hookid_t hookid;
        char *hookname;
   } trc hooknm t;
   typedef struct {
        } trc hookname t;
```

Return Values

Upon successful completion, the trc_hookname subroutine returns 0.

Error Codes

ENOMEM Not enough memory to satisfy the request.

TRCE_WARN A formatting error was found in the template file. If TRCE_WARN is returned, the

function completed.

TRCE_BADFORMAT A formatting error was found in the template file. If TRCE_BADFORMAT was returned,

the errno global variable is set to EINVAL.

trc ishookon Subroutine

Purpose

Check if a given trace hook word is being traced by system trace.

Library

Runtime Services Library (librts.a)

Syntax

#include <sys/trcmacros.h>

int trc_ishookon(int chan, long hkwd)

Description

The **trc_ishookon** subroutine returns 1 if tracing for the specified channel is on and the specified hook word is being traced, otherwise it returns 0.

Parameters

chan The channel to query ranging from channel number 0 though 7.

hkwd The hook word to be traced by system trace.

Return Values

- 1 The specified hook word is being traced.
- 0 Hook word is not being traced or system trace is off.

Files

/dev/systrct1[-{0-7}]

Related Information

The "trcstart Subroutine" on page 468 and "trcstop Subroutine" on page 469.

The trace Daemon in AIX 5L Version 5.3 Commands Reference, Volume 5.

trc_ishookset Subroutine

Purpose

Return an indication of all hooks currently being traced.

Library

libtrace.a

Syntax

#include <sys/libtrace.h>

int trc_ishookset(int chan, char *hkst, size_t hkst_sz)

Description

The **trc_ishookset** subroutine returns 1 if the specified channel is being traced, 0 otherwise. If it returns 1, the hookset item is modified to contain an indication of the hooks being traced. The facilities in the **libtrace.a** library for examining a data item of **trc_hookset_t** type can then be used.

Parameters

chan The channel to query ranging from channel number 0 through 7.

hkst Pointer to a variable of type trc_hookset_t.

hkst sz Size of the hookset being passed in.

Return Values

System trace is on. 1 0 System trace is off.

Files

/dev/systrct1[-{0-7}]

Related Information

The trc_hkemptyset, trc_hkfillset, trc_hkaddset, trc_hkdelset, and trc_hkisset Subroutine.

trc_libcntl Subroutine

Purpose

Performs trace API control functions.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
int trc_libcntl (handle, cmd, datap)
trc_log_handle_t handle;
int cmd:
void *datap;
```

Description

The trc_libcntl subroutine provides miscellaneous control functions.

Parameters

handle Contains the handle returned from a successful call to the trc_open subroutine. cmd

This is the control function to be performed. Supported functions are:

TRC_CNTL_ADJLINENO

This allows a trace report program to adjust the \$LINENO value supplied through the trace templates. Normally, a trace reporting program may assume the \$LINENO value is calculated based upon the first line of the output, in trchi_ascii, being the first line printed for that hook in the report. If this is not the case, such as with the 2line trcrpt option, the \$LINENO value must be adjusted.

For TRC_CNTL_ADJLINENO, the datap parameter must contain a signed long value which is added to \$LINENO. If the value is negative, TRC_CNTL_ADJLINENO will decrement the value.

TRC_CNTL_NAMELIST

This allows the namelist to be specified. The default is /unix. It does not initialize the symbols, however, and the trc libcntl subroutine returns EINVAL if the symbols are already initialized. If symbols are in the trace stream, specified by trace -n, those symbols are used regardless of the namelist specification.

TRC_CNTL_TEXTOFFSET

This offsets each line of text, in the trchi_ascii data area, by the number of character positions specified, plus (trchi indent-1) * 8; If the associated value is 0, each line is only offset by (trchi indent-1) * 8;

TRC CNTL TEXTOFFSET SUBSEQUENT

This works exactly like TRC_CNTL_TEXTOFFSET, except it offsets all lines except the first line of text. The first line is still offset by (trchi indent-1) * 8;

TRC CNTL PAGESIZE

This specifies the length of a page.

TRC CNTL TEXTHEADER

This specifies a header to be output every page, as specified by the TRC_CNTL_PAGESIZE command.

datap

Specifies the data parameter.

Return Values

Upon successful completion, the trc libcntl subroutine returns 0.

Error Codes

EINVAL

The handle or cmd parameter is invalid. EINVAL is also returned if the value specified with TRC_CNTL_ADJLINENO would cause the \$LINENO value to be negative.

The trace daemon in AIX 5L Version 5.3 Commands Reference, Volume 5.

The trcrpt, trcstop, and trcupdate commands in AIX 5L Version 5.3 Commands Reference, Volume 5.

trc_loginfo Subroutine

Purpose

Returns information about a trace log object.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
int trc loginfo (log object name, infop)
char *log object name;
trc_log_info_t *infop;
```

Description

The trc loginfo subroutine returns information about the named trace log object. If the log object name parameter is NULL or an empty string, the trc_loginfo subroutine returns information about the default log object.

Parameters

log_object_name infop

Names the trace log object. This is specified as it is for the **trc_open** subroutine. Points to an item of type trc log info t where the information will be returned. The trc log info t structure is defined in the /usr/include/sys/libtrace.h file. It contains such fields as the file size, the time the trace was taken, the trace log file magic number, the command used to start the trace, CPUs in the machine, number of CPUs traced, multi-CPU trace indicator (-C), and the trace object type as defined in the trcopen subroutine. The trc_free subroutine should be called to free the trc_loginfo_t information, even if the trc_loginfo subroutine returned an error.

The /usr/include/sys/libtrace.h file contains the data definitions for the returned data, *infop. The following table contains the data item name, data type, and description for each item returned:

Label	Data Type	Description
trci_magic	int	Structure magic number managed by the library.
trci_logmagic	int	The trace log file's magic number, see the /usr/include/sys/trchdr.h file. This identifies the type of log file, and is included mainly for completeness. The pertinent log file information may be gotten from other fields in this structure.
trci_time	time_t	The time the trace was taken.
trci_ipaddr	int	The system's IP address.
trci_uname	struct utsname	uname information.
trci_cmd	char *	The command used to start the trace.
trci_fnames	trci_fname_t*	Log file names array.
trci_mach_cpus	int	Number of CPUs in the machine.
trci_traced_cpus	int	Number of traced CPUs.
trci_flags	int	Data stream flags.
trci_obj_type	int	Trace object type.
trci_hookids	trc_hookset_t	Binary hook IDs map showing the hooks traced. This can be examined with the trc_hkisset subroutine.

The **trci** flags field contains bit flags as follows:

TRCIF MULTICPU

TRCIF_64BIT
TRCIF_SEPSEG
TRCIF_CONDTRACE
TRCIF_CONDEXCL
TRCIF_COMPONENT

This trace was taken with the **-C** trace option, (for example) it is a multi-CPU trace.

This is a 64-bit trace, 32-bit if not set.

Separate segment buffering was used.

Conditional trace by hookid, trace **-j**, **-k**, **-J**, or **-K**.

Trace hook exclusion, -k or -K, was used.

The given file is a Component Trace master file obtained by either the **ctctrl** command or the **trcdead** command.

Return Values

Upon successful completion, the **trc_loginfo** subroutine returns a 0, and information about the trace log object is placed into the memory pointed to by the *infop* parameter.

Error Codes

Upon error, the **trc_loginfo** subroutine returns information identical to that returned by the "trc_open Subroutine" on page 454.

Related Information

The "trc_open Subroutine" on page 454, "trc_close Subroutine" on page 440, "trc_read Subroutine" on page 457, "trc_find_first, trc_find_next, and trc_compare Subroutine" on page 441, "trc_seek and trc_tell Subroutine" on page 462, "trc_libcntl Subroutine" on page 450, "trc_strerror Subroutine" on page 463, "trc_perror Subroutine" on page 456, "trcstart Subroutine" on page 468, "trcon Subroutine" on page 468, "trcoff Subroutine" on page 467, "trcstop Subroutine" on page 469, and "trc_hkemptyset, trc_hkfillset, trc_hkaddset, trc_hkdelset, and trc_hkisset Subroutine" on page 446.

The trcrpt, trcstop, and trcupdate commands in AIX 5L Version 5.3 Commands Reference, Volume 5.

trc_logpath Subroutine

Purpose

Library

libtrace.a

Syntax

#include <sys/libtrace.h>

char *trc_logpath(void)

Description

The trc_logpath subroutine returns the default trace logfile path name. This is normally /var/adm/ras/trcfile, unless changed with the trcctl command or SMIT. Any process that can access and link to the libtrace.a library can call the trc_logpath subroutine and retrieve the current path to the default trace file. With the addition of the trcctl command to the available administration options, system administrators can now set the default to any path rather than always having /var/adm/ras/trcfile as the hard-coded default. Trace Report trcrpt calls the library routines trc_open and trc_loginfo to access the trace file. Beginning with AIX 5.3, trc_open and trc_loginfo both call trc_logpath to access the default

file, if it is required. Calling trc logpath is transparent to trcrpt and the Trace GUI; however, because trc logpath is available and exported in libtrace.a, other components and third-party products can use it.

Return Values

The trc_logpath subroutine always returns a path name. The path name should be freed, free(path), by the user when appropriate.

Related Information

The trcctl Command.

trc open Subroutine

Purpose

Opens a trace log object.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
int trc open (log object name, template file name, type, handlep)
char *log object name, template file name;
```

Description

trc_log_handle_t *handlep;

The trc open subroutine opens a trace log object. A log object may only be opened for reading.

Two object types are supported, raw and processed. As their names imply, a raw object consists of the raw trace data as it was traced. A processed object consists of data as processed by a trace formatting template file such as the /etc/trcfmt file.

Parameters

log object name

Specifies the log object to be opened. If this is NULL or an empty string, the default log object, /var/adm/ras/trcfile, is opened. If it is a dash, the input is read from standard input. In this case, the file must be a sequential trace file such as one produced by the trcrpt -r command, the -o trace option, or the trcdead command.

If the file is the base file for a multi-CPU trace, the trace events are merged by the trcrpt command, unless the TRC NOTEMPLATES option was specified. Also, if the file is a single CPU's trace file, it is treated as a single log file.

If multiple files are specified for merging, the TRC MULTI MERGE option must be specified. Each file must be separated from the previous one by a colon. For example, merging 3 files (f1, f2 and f3) is accomplished by setting the log_object_name parameter to f1:f2:f3. This names the template file. The template file is used if the TRC LOGPROC type is specified. If NULL, /etc/trcfmt (the default template file) is used. The template file

specification is ignored if the TRC_NOTEMPLATES option is specified.

template_file_name

type

Consists of flag bits OR'd together. One open type and one object type flag must be specified.

The following is the open type flag:

TRC LOGREAD

Open for reading

The following are the object type flags:

TRC LOGRAW

Specifies that raw trace data is to be read. This data is defined in Debug and Performance Tracing and in the /etc/trcfmt file.

TRC LOGPROC

This processes a raw trace log file, one produced by the trace command, using either the trace templates found in the /etc/trcfmt file, or the template file specified by the *template_file_name* parameter on the **trc_open** command.

The following are the modifier type flags:

TRC_LOGVERBATIM

Returns the file data verbatim, exactly as traced. This is how trcrpt -r returns data. See also the TRC_NOTEMPLATES modifier.

TRC LIBDEBUG

Turns on debug mode. This is for IBM customer support use only.

TRC LOGLIVE

The data returned in the **trc read t** structure is not a unique copy, it is live data. Such data may only be used until the next retrieval API operation. It is not necessary to call the trc_free subroutine to free such data. The TRC_LOGLIVE modifier is used to improve performance when the data read does not need to be retained.

TRC RETAIN HANDLE

Don't free the handle after an open failure. This allows errors to be processed by the trc_perror or trc_strerror subroutines. The trc_close subroutine must be used to free the file handle.

TRC NOTEMPLATES

Ignore any template file. This is used with the TRC_LOGRAW object flag to prevent any template processing, such as merging multi-CPU trace files. When used in conjunction with the TRC_LOGVERBATIM flag, it causes the retrieval API to return the same data reported with **trcrpt -r**.

TRC MULTI MERGE

Perform a merge operation on the files specified. Multiple files must be specified.

TRC REMOVE DUPS

If set, duplicate entries are eliminated when possible. Duplicate entries can only be detected when the CPU ID is known from the trace entry itself, not when it must be inferred. You can find out what the CPU ID is from the following trace sources:

- · A lightweight memory trace
- A multi-processor system trace (For example, use **trace -C all**.)
- A 64-bit system trace initiated with the -p option
- · A 64-bit component trace

This flag is valid only when TRC_MULTI_MERGE is specified.

Points to the handle returned from a successful call to the trc_open subroutine.

handlep

Return Values

Upon successful completion, the trc_open subroutine returns a 0 and puts the trace log object handle into the memory pointed to by the handlep parameter.

Error Codes

Upon error, the trc_open subroutine sets the errno global variable to a value in the errno.h file, and returns either an errno.h value, or an error value defined in the libtrace.h file.

EINVAL Invalid parameter. **ENOMEM** Cannot allocate memory.

TRCE_BADFORMAT The file is not a valid trace file, and errno is set to EINVAL.

TRCE_WARN The template file contains errors. The errno global variable is set to EINVAL if

TRCE_TMPLTFORMAT is returned. If TRCE_WARN is returned, the open

succeeded.

TRCE_TMPLTFORMAT The template file contains errors. The errno global variable is set to EINVAL if

TRCE_TMPLTFORMAT is returned. If TRCE_WARN is returned, the open

TRCE TOOMANY An internal limit is exceeded. The errno global variable is set to ENOMEM in this

case.

trc_perror Subroutine

Purpose

Prints all errors associated with a trace log object.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
void trc perror (handle, rv, str)
void *handle;
int rv:
char *str;
```

Description

The trc perror subroutine works like the perror subroutine. If the error in the rv parameter is an error from the errno.h file, it behaves exactly like the perror subroutine.

If there are multiple errors associated with the handle, the **trc_perror** subroutine prints all errors associated with the object. If the *str* parameter is NULL, the error's text is the only text printed. Errors are printed to standard error.

Parameters

handle Contains the handle returned from the call to the **trc_open** subroutine, the **trc_logpos_t** object

returned by the call to the **trc_loginfo** subroutine,or NULL. If a handle returned by the **trc_open**

subroutine is passed, the ${\it trc_open}$ subroutine need not have been successful, and the

TRC_RETAIN_HANDLE option must have been used.

rv The return value from a **libtrace** subroutine.

str Used the same as the string passed to the **perror** subroutine. Errors printed by the **trc_perror**

subroutine are printed as str: error-message.

The perror subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

trc read Subroutine

Purpose

Reads from a trace log object.

Library

libtrace.a

Syntax

#include <sys/libtrace.h>

int trc_read (handle, ret)
trc_log_handle_t handle;
trc_read_t *ret;

Description

The trc_read subroutine reads the next sequential data item from the trace log object whose handle is contained in the *handle* parameter. If the trc_read subroutine follows a trc_find_first or trc_find_next call, it reads the next sequential data item after the one found. To read the next item matching that criteria, use the trc_find_next subroutine. If the *handle* flag field contains both TRC_MULTI_MERGE and TRC_REMOVE_DUPS, the trc_read subroutine consumes any duplicate entries of the current event that might exist from other trace sources. The number of entries consumed will be returned in the trchi_dupcount or trcri_dupcount variable (depending on whether processed or raw data items, respectively, are requested) described in the Parameters section.

Parameters

handle Contains the handle returned from a successful call to the **trc_open** subroutine.

ret

Points to the trc_read_t structure to contain the returned information. The raw data will be formatted the same way it is formatted today in the trcrpt internal data buffer. This is described in the /etc/trcfmt file for both 32 and 64 bit events. Thus 32-bit trace items will be formatted as 32-bit items regardless of whether they came from a 32 or 64 bit trace. If TRC_LOGVERBATIM was specified, data is returned exactly as traced.

Processed data is the result of trace template processing, see the /etc/trcfmt file.

The trc free subroutine should be used to free data referenced from the trc read t data type. The trc_free subroutine need not be used if the TRC_LOGLIVE flag was specified when the object was opened.

The /usr/include/sys/libtrace.h file contains the data definitions for the returned data.

The following are definitions for the trc_read_t structure. They are split into three sections:

- · Definitions for both raw and processed data items
- · Definitions for raw data items only
- · Definitions for processed data items only

Label	Data Type	Description
trcr_magic		Trace read data magic number. This is maintained by the library to identify the library version in use.
trcr_flags	int	Flags that describe the data returned.

The following are definitions for raw data items:

Label	Data Type	Description
trcri_hookid	trc_hookid_t	Trace hook ID of the form 0x0hhh, where hhh is the hook ID value, (for example) 134.
trcri_subhookid	trc_subhookid_t	Subhook ID.
trcri_cpuid	unsigned	The CPU ID if known. If the TRCRF_CPUIDOK flag is set, the CPU ID value could be determined, otherwise it should be ignored.
trcri_tid	unsigned long long	Thread ID.
trcri_timestamp	unsigned long long	Specifies the timestamp in ticks. Use the trc_ticks2nanos function to convert this value to nanoseconds.
trcri_rawofst	unsigned long long	The offset to the start of this trace item in the trace log file.
trcri_rawlen	int	The length of the raw data as traced. This is not necessarily the amount of space used for the data in the log file.
trcri_rawbuf	char *	Pointer to the raw data.
trcri_component	char *	Current component name. Valid only when processing a component trace log file.
trcri_logfile	char *	Current file name.
trcri_dupcount	int	Number of events consumed by this trc_read call.

 $\mathsf{TRC_LONGD1}(r)$ - $\mathsf{TRC_LONGD5}(r)$ return the 5 data words traced by non-generic trace hooks. The rvalue is of type trc_read_t *, and must point to a trc_read_t item. These macros return unsigned, 64-bit values.

Note: These macros do not check to ensure that the specified register was traced.

The following are definitions for processed data items:

Label	Data Type	Description
trchi_hookid	trc_hookid_t	The trace hook ID of the form 0x0hhh, where hhh is the hook id value, (for example) 134.
trchi_subhookid	trc_subhookid_t	Subhook ID.
trchi_elapsed_nseconds	unsigned long long	The elapsed time from the start of the trace in nanoseconds.
trchi_tid	unsigned long long	Thread ID.
trchi_pid	unsigned long long	Process ID.
trchi_svc	unsigned long long	System call address.
trchi_rawofst	unsigned long long	Offset of the trace event in the log file.
trchi_trcontime	time64_t	The time of the last TRCON , or this TRCON .
trchi_trcofftime	time64_t	The time of the last TRCOFF , or this TRCOFF .
trchi_cpuid	int	CPU ID.
trchi_rcpu	int	CPUs remaining in this trace.
trchi_pri	int	Process priority.
trchi_intr_depth	int	Interrupt depth.
trchi_indent	int	The indentation level used by trcrpt . The values are -1 - \$NOPRINT , 0 - no indentation, 1 - application level, 2 - SVC level, 3 - kernel level. Items greater than zero specify the number of tabs, minus 1, that precede each line of the ascii data, see the trchi_ascii field. Each tab represents 8 blanks, so trchi_indent = 2 implies 2 - 1, or 1 tab before each line of data, or 8 blanks.
trchi_svcname	char *	Current svc name.
trchi_procname	char *	Current process name.
trchi_filename	char *	Current file name.
trchi_ascii	char *	This is the data produced by the trace template for this hook. Each line of data is indented with blanks, according to the trchi_indent value, and the text offset and the subsequent line offset, see the trc_libcntl subroutine.

Label	Data Type	Description
trchi_component	char *	Current component name. Valid only when processing a component trace log file.
trchi_logfile	char *	Current file name.
trchi_dupcount	int	Number of events consumed by this trc_read call.

The trcr flags field contains bit flags describing characteristics of the returned data. The values are:

TRCRF_RAW	Raw data was read, (for example) the log object was opened with the TRC_LOGRAW open type. Use the raw data items in the return data, (for example) those beginning with trcri
TRCRF_PROC	Processed data was read, (for example) the log object was opened with the TRC_LOGPROC open type. Use the processed data items in the return data, (for example) those beginning with trchi
TRCRF_64BIT	The data is from a 64-bit environment. Note that the trace itself may be from a 32 or 64 bit kernel.
TRCRF_TIMESTAMPED	The entry was timestamped when traced.
TRCRF_CPUIDOK	The cpu id is known. This is always set for a processed entry, and set for a raw entry if the cpuid was contained in each trace hook (see the -p trace command option), or the trace is a multi-cpu trace (see the -C trace option). For a processed trace, the cpu id may not be accurate if the appropriate hooks, 106 and 10C, weren't traced.
TRCRF_GENERIC	This is a generic trace entry, one traced with the TRCGEN or TRCGENT macros. This is set for a raw trace only.
TRCRF_64BITTRACE	This is a 64-bit trace, (for example) it was taken with a 64-bit kernel.
TRCRF_LIVEDATA	The data is live, don't free it. The data will be changed when another read operation is done.
TRCRF_NOPRINT	The associated trace template specified \$NOPRINT or \$SKIP , (for example) no data should be printed.

Return Values

Upon successful completion, the trc_read subroutine returns a 0 and puts the data into the ret area.

Error Codes

Upon error, the **trc_read** subroutine sets the **errno** global variable to a value from **errno.h**, and returns either a value from the **errno.h** file or an error defined in the **libtrace.h** file.

EINVAL The handle is not valid.

TRCE_BADFORMAT The trace data is improperly formatted, and the errno global variable is set to EINVAL.

trc_reg Subroutine

Purpose

Returns register values.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
```

```
int trc reg(handle, regid, ret)
trc_log_handle_t handle;
int regid;
uint64_t *ret;
```

Description

The trc_reg subroutine is used to retrieve machine-programmable register values from either a processed or raw trace entry. It returns a -1 if the specified item was not traced.

trc_reg is only valid for a 64-bit kernel trace.

Parameters

handle Contains the handle returned from a successful tro open.

regid One of the following reserved register identifiers found in libtrace.h:

TRC_PURR_ID

The PURR register.

TRC SPURR ID

The SPURR register.

TRC_MCR0_ID, TRC_MCR1_ID, TRC_MCRA_ID

The MCR registers, 0, 1, and A.

TRC_PMCn_ID

PMC register n, where n is a value from 1 to 8

Points to an unsigned 64-bit integer to hold the return data. If the PURR is returned, it is returned in the same units as the elapsed time (that is, ticks for a

raw trace and nanoseconds for a processed trace).

Return Values

ret

The trc_reg subroutine returns 0 on success; otherwise, it returns the errno value.

Error Codes

EINVAL The specified register ID is invalid.

TRCE_EOF The specified register ID is valid but was not traced.

Note: TRCE EOF is the libtrace error for EOF or not found.

Related Information

The trace daemon and trcrptcommand.

trc_seek and trc_tell Subroutine

Purpose

Seeks into a trace object and returns the current position that will be used with a future seek.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
int trc_seek (handle, log positionp, r)
trc_loghandle_t handle;
trc logpos_t log_positionp;
trc_read_t *r;
int trc tell (handle, log positionp)
trc_loghandle_t handle;
trc_logpos_t *log positionp;
```

Description

The trc_seek subroutine seeks into the log object identified by the handle parameter. The log_positionp parameter must have been obtained from a previous call to the trc tell subroutine. If the trc read t pointer, r, is not NULL, the trc_seek subroutine returns the trace data at the seek point.

The trc_tell subroutine creates a trc_logpos_t object using the current log position and state.

The trc_free subroutine should be used to free a trc_logpos_t object that's no longer needed. However, trc_free is not necessary if the trc_logpos_t object is passed to another trc_tell.

Parameters

handle Contains the handle returned from a successful call to the trc_open subroutine.

A trc logpos t returned by a previous call to the trc tell subroutine. log_positionp

If not NULL, points to a trc_read_t data item where the data at the new position is returned.

Return Values

Upon successful return, the trc_seek and trc_tell subroutines return 0.

Error Codes

If unsuccessful, the trc_seek subroutine returns an i/o error, or EINVAL if either the handle or log_positionp parameter is in error.

Upon error, the **trc_tell** subroutine returns **EINVAL** if the handle is invalid, or **ENOMEM** if storage can't be obtained for the **trc_logpos** t object.

Related Information

"trc_open Subroutine" on page 454, "trc_read Subroutine" on page 457, "trc_loginfo Subroutine" on page 451, "trc_find_first, trc_find_next, and trc_compare Subroutine" on page 441, "trc_libcntl Subroutine" on page 450, "trc_strerror Subroutine," "trc_perror Subroutine" on page 456, and "trc_hookname Subroutine" on page 447.

The perror subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

trc strerror Subroutine

Purpose

Returns the error message, or next error message, associated with a trace log object or **trc_loginfo** object.

Library

libtrace.a

Syntax

```
#include <sys/libtrace.h>
char *trc_strerror (handle, rv)
void *handle;
int rv;
```

Description

The **trc_strerror** subroutine is similar to the **strerror** subroutine. If the error in the *rv* parameter is an error from the **error**. It is possible for multiple **libtrace** errors to be present. The **trc_strerror** subroutine returns the next error in this case. When no more errors are present, the **trc_strerror** subroutine returns NULL.

Like the **strerror** subroutine, the **trc strerror** subroutine must not be used in a threaded environment.

Parameters

handle Contains the handle returned from the **trc_open** subroutine, the pointer to a **trc_loginfo_t** object, or NULL. If a handle returned by the **trc_open** subroutine is passed, the **trc_open** subroutine need not have been successful, but the **TRC_RETAIN_HANDLE** open option must have been used.

rv Contains the return value from a call to the **libtrace** subroutine.

Return Values

The **trc_strerror** subroutine returns a pointer to the associated error message. It returns NULL if no more errors are present.

Examples

 To retrieve all error messages from a call to the trc_open subroutine, call the trc_strerror subroutine as follows:

```
trc loghandle t h;
      int rv;
      char *fn, *tfn, *s;
       rv = trc open(fn,tfn, TRC LOGREAD|TRC LOGPROC|TRC RETAIN HANDLE, &h);
       while (rv && s=trc_strerror(h, rv)) {
         fprintf(stderr, "%s\n", s);
   }
2. To accomplish the same thing as the previous example with a single call, do the following:
      trc loghandle t h;
      int rv;
      char *fn, *tfn;
      rv = trc open(fn,tfn, TRC LOGREAD|TRC LOGPROC|TRC RETAIN HANDLE, &h);
      if (rv) trc perror(h, rv, "");
```

Related Information

tregen or tregent Subroutine

Purpose

Records a trace event for a generic trace channel.

Library

Runtime Services Library (librts.a)

Syntax

```
#include <sys/trchkid.h>
void trcgen(Channel, HkWord, DataWord, Length, Buffer)
unsigned int Channel, HkWord, DataWord, Length;
char * Buffer;
void trcgent(Channel, HkWord, DataWord, Length, Buffer)
unsigned int Channel, HkWord, DataWord, Length;
char *Buffer;
```

Description

The **trcgen** subroutine records a trace event for a generic trace entry consisting of a hook word, a data word, a variable number of bytes of trace data and, beginning with AIX 5L Version 5.3 with the 5300-05 Technology Level, a time stamp. The **trcgent** subroutine records a trace event for a generic trace entry consisting of a hook word, a data word, a variable number of bytes of trace data, and a time stamp.

The **trcgen** subroutine and **trcgent** subroutine are located in pinned kernel memory.

Parameters

Buffer Channel DataWord HkWord Specifies a pointer to a buffer of trace data. The maximum size of the trace data is 4096 bytes.

Specifies a channel number for the trace session, obtained from the trcstart subroutine.

Specifies a word of user-defined data.

Specifies an integer consisting of two bytes of user-defined data (*HkData*), a hook ID (*HkID*), and a hook type (*Hk_Type*).

HkData Specifies two bytes of user-defined data.

HkID Specifies a hook identifier. For user programs, the hook ID value ranges from 010 to 0FF.

Hk_Type

Specifies a 4-bit value that identifies the amount of trace data to be recorded:

Value	Records
1	Hook word
9	Hook word and a time stamp
2	Hook word and one data word
Α	Hook word, one data word, and a time stamp
6	Hook word and up to five data words
E	Hook word, up to five data words, and a time stamp.

Length Specifies the length in bytes of the Buffer parameter.

The trace daemon.

The **trcgenk** kernel service, **trcgenkt** kernel service.

trchook, utrchook, trchook64, and utrhook64 Subroutine

Purpose

Records a trace event.

Library

Runtime Services Library (librts.a)

Syntax

#include <sys/trchkid.h>

```
void trchook( HkWord, d1, d2, d3, d4, d5) unsigned int HkWord, d1, d2, d3, d4, d5; void utrchook(HkWord, d1, d2, d3, d4, d5) unsigned int HkWord, d1, d2, d3, d4, d5; void trchook64 (HkWord, d1, d2, d3, d4, d5) unsigned long HkWord, d1, d2, d3, d4, d5;
```

void utrchook64 (HkWord, d1, d2, d3, d4, d5) unsigned long HkWord, d1, d2, d3, d4, d5;

Description

The trchook subroutine records a trace event if a trace session is active. Input parameters include a hook word (HkWord) and from 0 to 5 words of data. The trchook and trchook64 subroutines are intended for use by the kernel and extensions.

The **utrchook** and **utrchook64** subroutines are intended for programs running at user (application) level.

The trchook and utrchook subroutines are for use in a 32-bit environment, while the trchook64 and utrchook64 subroutines are intended for use in a 64-bit environment. Note that if running a 64-bit application on a 32-bit kernel, the application should use utrchook64(the subroutine for its 64-bit environment).

It is strongly recommended that the C macros TRCHKLn and TRCHKLnT (where n is from 0 to 5) be used if possible, instead of calling these subroutines directly.

Beginning with AIX 5L Version 5.3 with the 5300-05 Technology Level, all events are implicitly appended with a time stamp.

Parameters

d1, d2, d3, d4, d5 HkWord

Up to 5 words of data from the calling program.

The HkWord parameter has a different format based upon the environment. For the trchook and utrchook subroutines, it is an unsigned long consisting of a hook ID (HkID), a hook type (Hk_Type), and two bytes of data from the calling program (HkData).

A hook ID is a 12-bit value. For user programs, the hook ID may be a HkID value from 0x010 to 0x0FF. Hook identifiers are defined in the /usr/include/sys/trchkid.h file.

Hk_Type

A 4-bit value that identifies the amount of trace data to be recorded:

Value	Records
1	Hook word
9	Hook word and a time stamp
2	Hook word and one data word
Α	Hook word, one data word, and a time stamp
6	Hook word and up to five data words
E	Hook word, up to five data words, and a time stamp.

HkData Two bytes of data from the calling program.

In a 64-bit environment, when using the trchook64 or utrchook64 subroutine, the format is ffffllllhhhxssss, where *f* represents flags, *l* is length, *h* is the hook id, and *s* is the subhook.

The hook and subhook ids are the same as for the 32-bit environment (12-bit hook id and a 16-bit subhook id). Note that the 4 bits between the hook id and subhook are unused.

The flags (the first 16 bits of the 64-bit hookword) are specified as follows:

8000 The hook should be timestamped.

4000 A generic trace entry, should not use the trchook64 or utrchook64 subroutine. For more information see "trcgen or trcgent Subroutine" on page 464.

2000 The hook contains 32-bit data. Used by aix trace only.

1000 Automatically include the cpuid when tracing the data.

The length (I) is the second 16 bits of the hookword. It is the length of the data. The length is 0 if no data other than the hookword is traced (TRCHKL0), 8 if one parameter, 8 bytes, is traced (TRCHKL1), 16 for 2 parameters, 24 for 3 parameters, 32 for 4 parameters, and 40 for 5 parameters (TRCHKL5).

The **trace** daemon.

The **trcgenk** kernel service, **trcgenkt** kernel service.

trcoff Subroutine

Purpose

Halts the collection of trace data from within a process.

Library

Runtime Services Library (librts.a)

Syntax

int trcoff(Channel) int Channel;

Description

The trcoff subroutine stops trace data collection for a trace channel. The trace session must have already been started using the trace command or the trcstart subroutine.

Parameters

Channel Channel number for the trace session.

Return Values

If the trcoff subroutine was successful, zero is returned and trace data collection stops. If unsuccessful, a negative one is returned.

Related Information

The trcgen ("trcgen or trcgent Subroutine" on page 464) subroutine, trchook ("trchook, utrchook, trchook64, and utrhook64 Subroutine" on page 465) subroutine, trcon ("trcon Subroutine" on page 468) subroutine, trcstart ("trcstart Subroutine" on page 468) subroutine, trcstop ("trcstop Subroutine" on page 469) subroutine.

The trace daemon.

trcgenk kernel service, trcgenkt kernel service.

trcon Subroutine

Purpose

Starts the collection of trace data.

Library

Runtime Services Library (librts.a)

Syntax

int trcon(Channel) int Channel;

Description

The trcon subroutine starts trace data collection for a trace channel. The trace session must have already been started using the trace command or the trcstart ("trcstart Subroutine") subroutine.

Parameters

Channel

Specifies one of eight trace channels. Channel number 0 always refers to the Event/Performance trace. Channel numbers 1 through 7 specify generic trace channels.

Return Values

If the trcon subroutine was successful, zero is returned and trace data collection starts. If unsuccessful, a negative one is returned.

Related Information

The trace daemon.

The trcgenk kernel service, trcgenkt kernel service.

trestart Subroutine

Purpose

Starts a trace session.

Library

Runtime Services Library (librts.a)

Syntax

int trcstart(Argument) char *Argument;

Description

The **trcstart** subroutine starts a trace session. The *Argument* parameter points to a character string containing the flags invoked with the trace daemon. To specify that a generic trace session is to be started, include the -g flag.

Parameters

Argument

Character pointer to a string holding valid arguments from the trace daemon.

Return Values

If the trace daemon is started successfully, the channel number is returned. Channel number 0 is returned if a generic trace was not requested. If the trace daemon is not started successfully, a value of -1 is returned.

Files

/dev/trace

Trace special file.

Related Information

The trcon ("trcon Subroutine" on page 468) subroutine.

The **trace** daemon.

trcstop Subroutine

Purpose

Stops a trace session.

Library

Runtime Services Library (librts.a)

Syntax

int trcstop(Channel) int Channel;

Description

The **trcstop** subroutine stops a trace session for a particular trace channel.

Parameters

Channel

Specifies one of eight trace channels. Channel number 0 always refers to the Event/Performance trace. Channel numbers 1 through 7 specify generic trace channels.

Return Values

- 0 The trace session was stopped successfully.
- -1 The trace session did not stop.

Related Information

The trcgenk kernel service, trcgenkt kernel service.

trunc, truncf, truncl, truncd32, truncd64, or truncd128 Subroutine

Purpose

Rounds to truncated integer value.

Syntax

```
#include <math.h>
double trunc (x)
double x;
float truncf (x)
float x;
long double truncl (x)
long double x;
Decimal32 truncd32(x)
Decimal32 x;
Decimal64 truncd64(x)
_Decimal64 x;
Decimal128 truncd128(x)
Decimal 128 x;
```

Description

The trunc, truncf, truncd, truncd32, truncd64, and truncd128 subroutines round the x parameter to the integer value, in floating format, nearest to but no larger in magnitude than the x parameter.

Parameters

Specifies the value to be rounded.

Return Values

Upon successful completion, the trunc, truncf, truncl, truncd32, truncd64, and truncd128 subroutines return the truncated integer value.

If x is NaN, a NaN is returned.

If x is ± 0 or $\pm \ln x$ is returned.

Related Information

math.h in AIX 5L Version 5.3 Files Reference.

truncate, truncate64, ftruncate, or ftruncate64 Subroutine

Purpose

Changes the length of regular files or shared memory object.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
int truncate ( Path, Length)
const char *Path;
off t Length;
int ftruncate (FileDescriptor, Length)
int FileDescriptor;
off t Length;
Note: The truncate64 and ftruncate64 subroutines apply to AIX 4.2 and later releases.
int truncate64 ( Path, Length)
const char *Path;
off64 t Length;
int ftruncate64 ( FileDescriptor, Length)
int FileDescriptor;
```

Description

off64_t Length;

Note: The truncate64 and ftruncate64 subroutines apply to AIX 4.2 and later releases.

The truncate and ftruncate subroutines change the length of regular files or shared memory object.

The Path parameter must point to a regular file for which the calling process has write permission. The Length parameter specifies the desired length of the new file in bytes.

The Length parameter measures the specified file in bytes from the beginning of the file. If the new length is less than the previous length, all data between the new length and the previous end of file is removed. If the new length in the specified file is greater than the previous length, data between the old and new lengths is read as zeros. Full blocks are returned to the file system so that they can be used again, and the file size is changed to the value of the *Length* parameter.

If the file designated in the Path parameter names a symbolic link, the link will be traversed and path-name resolution will continue.

These subroutines do not modify the seek pointer of the file.

These subroutines cannot be applied to a file that a process has open with the O_DEFER flag.

Successful completion of the truncate or ftruncate subroutine updates the st ctime and st mtime fields of the file. Successful completion also clears the SetUserID bit (S ISUID) of the file if any of the following are true:

- The calling process does not have root user authority.
- The effective user ID of the calling process does not match the user ID of the file.
- The file is executable by the group (S_IXGRP) or others (S_IXOTH).

These subroutines also clear the SetGroupID bit (S ISGID) if:

- · The file does not match the effective group ID or one of the supplementary group IDs of the process
- OR
- The file is executable by the owner (S IXUSR) or others (S IXOTH).

Note: Clearing of the SetUserID and SetGroupID bits can occur even if the subroutine fails because the data in the file was modified before the error was detected.

truncate and ftruncate can be used to specify any size up to OFF MAX. truncate64 and ftruncate64 can be used to specify any length up to the maximum file size for the file.

In the large file enabled programming environment, truncate is redefined to be truncate4 and ftruncate is redefined to be ftruncate64.

Parameters

Path Specifies the name of a file that is opened, truncated, and then closed.

FileDescriptor Specifies the descriptor of a file or shared memory object that must be open for writing.

Length Specifies the new length of the truncated file in bytes.

Return Values

Upon successful completion, a value of 0 is returned. If the truncate or ftruncate subroutine is unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the nature of the error.

Error Codes

The **truncate** and **ftruncate** subroutines fail if the following is true:

EROFS An attempt was made to truncate a file that resides on a read-only file system.

Note: In addition, the truncate subroutine can return the same errors as the open subroutine if there is a problem opening the file.

The **truncate** and **ftruncate** subroutines fail if one of the following is true:

EAGAIN The truncation operation fails due to an enforced write lock on a portion of the file being truncated.

Because the target file was opened with the O_NONBLOCK or O_NDELAY flags set, the subroutine

fails immediately rather than wait for a release.

EDQUOT New disk blocks cannot be allocated for the truncated file. The quota of the user's or group's allotted

disk blocks has been exhausted on the target file system.

EFBIG An attempt was made to write a file that exceeds the process' file size limit or the maximum file size. If

the user has set the environment variable **XPG_SUS_ENV=ON** prior to execution of the process, then

the SIGXFSZ signal is posted to the process when exceeding the process' file size limit.

EFBIG The file is a regular file and *length* is greater than the offset maximum established in the open file

description associated with fildes.

EINVAL The file is not a regular file.

EINVAL The *Length* parameter was less than zero.

EISDIR The named file is a directory.

EINTR A signal was caught during execution.

EIO An I/O error occurred while reading from or writing to the file system.

EMFILE The file is open with **O_DEFER** by one or more processes.

ENOSPC New disk blocks cannot be allocated for the truncated file. There is no free space on the file system

containing the file.

ETXTBSY The file is part of a process that is running.

EROFS The named file resides on a read-only file system.

Notes:

1. The **truncate** subroutine can also be unsuccessful for other reasons. For a list of additional errors, see "Base Operating System Error Codes For Services That Require Path-Name Resolution".

2. The **truncate** subroutine can return the same errors as the **open** subroutine if there is a problem opening the file.

The **ftruncate** subroutine fails if the following is true:

EBADF The *FileDescriptor* parameter is not a valid file descriptor open for writing.

EINVAL The *FileDescriptor* argument references a file that was opened without write permission.

The truncate function will fail if:

EACCES A component of the path prefix denies search permission, or write permission

is denied on the file.

EISDIR The named file is a directory.

ELOOP Too many symbolic links were encountered in resolving *path*.

ENAMETOOLONG The length of the specified pathname exceeds **PATH_MAX** bytes, or the length

of a component of the pathname exceeds NAME_MAX bytes.

ENOENT A component of *path* does not name an existing file or *path* is an empty string.

ENTDIRA component of the path prefix of *path* is not a directory. **EROFS**The named file resides on a read-only file system.

The truncate function may fail if:

ENAMETOOLONG Pathname resolution of a symbolic link

produced an intermediate result whose length exceeds **PATH_MAX**.

Related Information

The fclear subroutine, openx, open, or creat subroutine.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tsearch, tdelete, tfind or twalk Subroutine

Purpose

Manages binary search trees.

Library

Standard C Library (libc.a)

Syntax

```
#include <search.h>
void *tsearch ( Key, RootPointer, ComparisonPointer)
const void *Key;
void **RootPointer:
int (*ComparisonPointer) (const void *Element1, const void *Element2);
void *tdelete (Key, RootPointer, ComparisonPointer)
const void *Key;
void **RootPointer;
int (*ComparisonPointer) (const void *Element1, const void *Element2);
void *tfind (Key, RootPointer, ComparisonPointer)
const void *Key;
void *const *RootPointer;
int (*ComparisonPointer) (const void *Element1, const void *Element2);
void twalk ( Root, Action)
const void *Root:
void (*Action) (const void *Node, VISIT Type, int Level);
```

Description

The tsearch, tdelete, tfind and twalk subroutines manipulate binary search trees. Comparisons are made with the user-supplied routine specified by the ComparisonPointer parameter. This routine is called with two parameters, the pointers to the elements being compared.

The **tsearch** subroutine performs a binary tree search, returning a pointer into a tree indicating where the data specified by the Key parameter can be found. If the data specified by the Key parameter is not found, the data is added to the tree in the correct place. If there is not enough space available to create a new node, a null pointer is returned. Only pointers are copied, so the calling routine must store the data. The RootPointer parameter points to a variable that points to the root of the tree. If the RootPointer parameter is the null value, the variable is set to point to the root of a new tree. If the RootPointer parameter is the null value on entry, then a null pointer is returned.

The **tdelete** subroutine deletes the data specified by the *Key* parameter. The *RootPointer* and ComparisonPointer parameters perform the same function as they do for the **tsearch** subroutine. The variable pointed to by the *RootPointer* parameter is changed if the deleted node is the root of the binary tree. The **tdelete** subroutine returns a pointer to the parent node of the deleted node. If the data is not found, a null pointer is returned. If the RootPointer parameter is null on entry, then a null pointer is returned.

The **tfind** subroutine searches the binary search tree. Like the **tsearch** subroutine, the **tfind** subroutine searches for a node in the tree, returning a pointer to it if found. However, if it is not found, the **tfind** subroutine will return a null pointer. The parameters for the tfind subroutine are the same as for the tsearch subroutine.

The twalk subroutine steps through the binary search tree whose root is pointed to by the RootPointer parameter. (Any node in a tree can be used as the root to step through the tree below that node.) The Action parameter is the name of a routine to be invoked at each node. The routine specified by the Action parameter is called with three parameters. The first parameter is the address of the node currently being pointed to. The second parameter is a value from an enumeration data type:

typedef enum [preorder, postorder, endorder, leaf] VISIT;

(This data type is defined in the **search.h** file.) The actual value of the second parameter depends on whether this is the first, second, or third time that the node has been visited during a depth-first, left-to-right traversal of the tree, or whether the node is a leaf. A leaf is a node that is not the parent of another node. The third parameter is the level of the node in the tree, with the root node being level zero.

Although declared as type pointer-to-void, the pointers to the key and the root of the tree should be of type pointer-to-element and cast to type pointer-to-character. Although declared as type pointer-to-character, the value returned should be cast into type pointer-to-element.

Parameters

Points to the data to be located. Key

ComparisonPointer Points to the comparison function, which is called with two parameters that point to

the elements being compared.

RootPointer Points to a variable that in turn points to the root of the tree.

Action Names a routine to be invoked at each node. Root Points to the roots of a binary search node.

Return Values

The comparison function compares its parameters and returns a value as follows:

- If the first parameter is less than the second parameter, the ComparisonPointer parameter returns a value less than 0.
- If the first parameter is equal to the second parameter, the ComparisonPointer parameter returns a value of 0.
- If the first parameter is greater than the second parameter, the ComparisonPointer parameter returns a value greater than 0.

The comparison function need not compare every byte, so arbitrary data can be contained in the elements in addition to the values being compared.

If the node is found, the tsearch and tfind subroutines return a pointer to it. If the node is not found, the tsearch subroutine returns a pointer to the inserted item and the tfind subroutine returns a null pointer. If there is not enough space to create a new node, the tsearch subroutine returns a null pointer.

If the RootPointer parameter is a null pointer on entry, a null pointer is returned by the tsearch and tdelete subroutines.

The tdelete subroutine returns a pointer to the parent of the deleted node. If the node is not found, a null pointer is returned.

Searching and Sorting Example Program, Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ttylock, ttywait, ttyunlock, or ttylocked Subroutine

Purpose

Controls tty locking functions.

Library

Standard C Library (libc.a)

Syntax

int ttylock (DeviceName)
char *DeviceName;
int ttywait (DeviceName)
char *DeviceName;
int ttyunlock (DeviceName)
char *DeviceName;
int ttylocked (DeviceName)
char *DeviceName;

Description

The **ttylock** subroutine creates the **LCK**..*DeviceName* file in the **/etc/locks** directory and writes the process ID of the calling process in that file. If **LCK**..*DeviceName* exists and the process whose ID is contained in this file is active, the **ttylock** subroutine returns an error.

There are programs like **uucp** and **connect** that create tty locks in the **/etc/locks** directory. The convention followed by these programs is to call the **ttylock** subroutine with an argument of **DeviceName** for locking the **/dev/DeviceName** file. This convention must be followed by all callers of the **ttylock** subroutine to make the locking mechanism work.

The **ttywait** subroutine blocks the calling process until the lock file associated with *DeviceName*, the **/etc/locks/LCK..***DeviceName* file, is removed.

The **ttyunlock** subroutine removes the lock file, **/etc/locks/LCK..** *DeviceName*, if it is held by the current process.

The **ttylocked** subroutine checks to see if the lock file, **/etc/locks/LCK.**.*DeviceName*, exists and the process that created the lock file is still active. If the process is no longer active, the lock file is removed.

Parameters

DeviceName Specifies the name of the device.

Return Values

Upon successful completion, the **ttylock** subroutine returns a value of 0. Otherwise, a value of -1 is returned.

The **ttylocked** subroutine returns a value of 0 if no process has a lock on device. Otherwise, a value of -1 is returned.

Examples

1. To create a lock for /dev/tty0, use the following statement:

```
rc = ttylock("tty0");
```

2. To lock /dev/tty0 device and wait for lock to be cleared if it exists, use the following statements:

```
if (ttylock("tty0"))
    ttywait("tty0");
rc = ttylock("tty0");
```

3. To remove the lock file for device /dev/tty0 created by a previous call to the ttylock subroutine, use the following statement:

```
ttyunlock("tty0");
```

4. To check for a lock on /dev/tty0, use the following statement:

```
rc = ttylocked("tty0");
```

Related Information

The /etc/locks directory.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ttyname or isatty Subroutine

Purpose

Gets the name of a terminal or determines if the device is a terminal.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
char *ttyname( FileDescriptor)
int FileDescriptor;
int isatty(FileDescriptor)
int FileDescriptor;
```

Description

Attention: Do not use the ttyname subroutine in a multithreaded environment.

The **ttyname** subroutine gets the path name of a terminal.

The **isatty** subroutine determines if the file descriptor specified by the *FileDescriptor* parameter is associated with a terminal.

The isatty subroutine does not necessarily indicate that a person is available for interaction, since nonterminal devices may be connected to the communications line.

Parameters

FileDescriptor Specifies an open file descriptor.

Return Values

The **ttyname** subroutine returns a pointer to a string containing the null-terminated path name of the terminal device associated with the file descriptor specified by the FileDescriptor parameter. A null pointer is returned and the errno global variable is set to indicate the error if the file descriptor does not describe a terminal device in the /dev directory.

The return value of the **ttyname** subroutine may point to static data whose content is overwritten by each call.

If the specified file descriptor is associated with a terminal, the isatty subroutine returns a value of 1. If the file descriptor is not associated with a terminal, a value of 0 is returned and the errno global variable is set to indicate the error.

Error Codes

The **ttyname** and **isatty** subroutines are unsuccessful if one of the following is true:

The FileDescriptor parameter does not specify a valid file descriptor. **ENOTTY** The FileDescriptor parameter does not specify a terminal device.

Files

/dev/* Terminal device special files.

Related Information

The **ttyslot** ("ttyslot Subroutine") subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ttyslot Subroutine

Purpose

Finds the slot in the **utmp** file for the current user.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h> int ttyslot (void)

Description

The ttyslot subroutine returns the index of the current user's entry in the /etc/utmp file. The ttyslot subroutine scans the /etc/utmp file for the name of the terminal associated with the standard input, the standard output, or the error output file descriptors (0, 1, or 2).

The **ttyslot** subroutine returns -1 if an error is encountered while searching for the terminal name, or if none of the first three file descriptors (0, 1, and 2) is associated with a terminal device.

Files

/etc/inittab The path to the **inittab** file, which controls the initialization process.

/etc/utmp The path to the **utmp** file, which contains a record of users logged in to the system.

Related Information

The **getutent** subroutine, **ttyname** or **isatty** ("ttyname or isatty Subroutine" on page 477) subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ukey_enable Subroutine

Purpose

Enables user-keys in a process.

Library

Standard C library (libc.a)

Syntax

#include <sys/ukeys.h>

int ukey_enable (void)

Description

The **ukey enable** subroutine allows a process access to the user-keys memory protection facilities. A process must make a successful call to the ukey_enable subroutine to enable user-keys before attempting other user-key specific APIs. The following are necessary conditions for enabling user-keys for a process:

- 1. Running with the 64-bit kernel. User-keys are not supported on the 32-bit kernel.
- 2. Running on hardware that supports storage-keys and user-keys have not been explicitly disabled. By default, user-keys are enabled if the platform supports it. The sysconf (_SC_AIX_UKEYS) subroutine returns the number of available user-keys.
- 3. If multi-threaded, the process must be running in system-scope such as 1:1 mode.
- 4. Process is not checkpointable for Load Leveler dispatched jobs.

All threads of a user-key enabled process are initially set-up with an active user-key-set that only allows both read and write access to memory pages that have been assigned to the UKEY_PUBLIC, the default user-key. Individual threads can modify their active user-key-set by calling user-key APIs to construct and activate user-key-sets.

Signal Context for User-Key-Enabled processes:

The default signal context for a user-key-enabled process is modified for any future signals that are received. The *ucontext t* structure is extended to include the active user-key-set of the interrupted thread. This is provided to signal handlers.

Note: Although signal handlers take a pointer to the sigcontext_t as per the documentation for the sigaction subroutine, the actual structure constructed on the stack is the ucontext_t structure, which is a superset of the **sigcontext** t and matches it in its initial portion. By pointing at the signal context with an *ucontext t* pointer, signal handlers might access the extended data.

The following fields are set:

```
ucontext_t.__extctx.__flags |= __EXTCTX_UKEYS
ucontext_t.__extctx.__ukeys[2] = active user-key-set
```

The user-key extended context is independent of VMX context and is built for all processes that are user-key-enabled.

Additionally, if a storage key exception is taken, the exception type field is set to indicate this in the extended context:

```
ucontext_t.uc_mcontext.jmp_context.excp_type = EXCEPT_SKEY.
```

See the sys/context.h header file for a more detailed layout of the extended context information.

Return Values

When successful, the ukey enable subroutine returns the number of available user-keys. Otherwise, it returns a value of -1 and sets the errno global variable to indicate the error.

Errors Codes

ENOSYS

User-keys are not supported.

AIX Vector Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ukeyset_add_key, ukeyset_remove_key, ukeyset_add_set or ukeyset remove set Subroutine

Purpose

Operates on and modifies a user-key-set.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/ukeys.h>
int ukeyset_add_key (uset, key, flags)
ukeyset_t * uset;
```

```
ukey_t key;
unsigned int flags;
int ukeyset remove key (uset, key, flags)
ukeyset t * uset;
ukey t key;
unsigned int flags;
int ukeyset_add_set (uset, aset)
ukeyset t * uset;
ukeyset t aset;
int ukeyset remove set (uset, rset)
ukeyset t * uset;
ukeyset t rset;
```

Description

These subroutines operate on and modify user-key-sets. The user-key-set must have been originally initialized with the ukeyset init subroutine.

Individual or groups (sets) of user-keys can be added or removed. When adding or removing an individual key, the accesses (read or write, or both read and write) being added or removed must be specified through the *flags* parameter. When adding or removing user-key-sets, specification is not required, because a key-set contains not only information on what keys are enabled, but also information on which specific access permissions are enabled for each one of those keys.

The **ukeyset add key** subroutine adds the user-key specified by the key parameter with accesses as specified by the flags parameter to the user-key-set specified by the uset parameter. The ukeyset remove key subroutine removes the accesses specified by the flags parameter of the key specified by the key parameter from the user-key-set specified by the uset parameter. The ukeyset_add_set subroutine adds the keys and accesses specified by the aset key-set parameter to the user-key-set specified by the uset parameter. The ukeyset_remove_set subroutine removes the keys and accesses specified by the rset key-set parameter from the user-key-set specified by the uset parameter.

Note: An add operation of a key (or key-set) and then a subsequent remove operation of the same key (or key-set) might not result in the original key-set. For example, if a key already exists in a key-set, adding the same key has no effect on the key-set, but then a subsequent remove key operation results in a new key-set minus the removed key.

Attempting to remove a defined user-key that does not exist in the source key-set is ignored silently in a manner similar to the signal set services.

These subroutines will fail unless the ukey_enable subroutine has already been successfully executed by a thread in the process. Refer to the Storage Protect Keys article for more details.

Parameters

User-key-set to be modified. User-key-set to remove. rset aset User-key-set to add.

key User-key to add or remove from a key-set. This parameter is combined with read or

write flags when performing add or remove operations.

flags

The following flags are defined for the ukeyset_add_key() and ukeyset_remove_key() services:

- UK_READ Specifies that the read access for a key is to be added or removed.
- UK_WRITE Specifies that the write access for a key is to be added or removed.
- UK_RW Specifies that read and write access are to be added or removed.

Return Values

If successful, the user-key-set subroutines return a value of 0. Otherwise, they return a value of -1 and set the **errno** global variable to indicate the error.

Errors Codes

The ukeyset_add_key and ukeyset_remove_key subroutines are unsuccessful if the following are true:

EINVAL Invalid *flags* parameter, invalid key-set specified in *uset* parameter or invalid

(undefined) keys specified in the key parameter.

ENOSYS Unconfigured (unavailable) private key specified in the key parameter or process is

not user-key enabled.

The ukeyset_add_set, ukeyset_remove_set, ukeyset_add_set and ukeyset_remove_set subroutines are unsuccessful if the following are true:

EINVAL Invalid key-set specified in uset, rset or aset parameter.

ENOSYS Process is not user-key enabled.

Only the subroutines that take keys (instead of keysets) to add or remove can fail because of invalid or unused key number or invalid access flags.

Related Information

The ukey_enable subroutine.

The **ukeyset_init** subroutine.

The ukeyset_activate subroutine.

The **ukeyset_ismember** subroutine.

ukeyset_activate Subroutine

Purpose

Activates a user-key-set and returns the previously active user-key-set.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/ukeys.h>
```

```
ukeyset t ukeyset activate (set, command)
ukeyset_t set;
int command;
```

Description

The **ukeyset_activate** subroutine changes the currently active user-key-set and returns the previously active user-key-set. The **UKEY_PUBLIC** is always enabled for both read and write.

For performance reasons, the **ukeyset_activate** subroutine is implemented through special linkage that also executes a fast-path system call. One consequence of running a fast-path system call is that the **errno** global variable is not updated for errors. Instead, the subroutine silently ignores some errors (for instance, attempts to remove or add **UKEY_PUBLIC** value are ignored), or if it is unsuccessful, it returns the **UKSET_INVALID** value.

Attention: Calling this subroutine in a system that does not support storage keys or has user keys disabled results in a SIGILL signal.

Parameters

set command

User-key-set.

One of the following:

- UKA_REPLACE_KEYS Replaces key-set with the specified key-set.
- UKA_ADD_KEYS Adds the specified key-set to the current key-set.
- UKA_REMOVE_KEYS Removes the specified key-set from the active key-set.
- UKA_GET_KEYS Reads the current key-set value without updating the current key-set. The input key-set is ignored.

Return Values

Upon success, the **ukeyset_activate** subroutine returns the previously active user-key-set. If called with the **UKA_GET_KEYS** command, this will also be the current active key-set. If unsuccessful, the **ukeyset_activate** key-set returns a value of the **UKSET_INVALID**.

Errors Codes

The ukeyset_activate subroutine does not update errno if unsuccessful.

Related Information

The ukey_enable subroutine.

ukey_setjmp Subroutine

Purpose

Saves the current execution context and active user-key-set.

Library

Standard C library (libc.a)

Syntax

```
#include <setjmp.h>
#include <sys/ukeys.h>

int ukey_setjmp (ukey_context)
ukey jmp buf ukey context;
```

Description

The ukey_setimp subroutine saves the current stack context and signal mask and additionally saves the current active user-key-set in the *ukey_context* special jump buffer.

The ukey_context can be passed as a parameter to the longimp subroutine, which restores not only the execution context but also the saved user-key-set.

Parameters

ukey_context

Specifies the address for a *ukey_imp_buf* structure.

Return Values

The **ukey_setjmp** subroutine returns a value of 0, unless the return is from a call to the **longjmp** function, in which case the **ukey setimp** subroutine returns a nonzero value.

Related Information

The **setimp** or **longimp** subroutine.

The **ukey_enable** subroutine.

The ukeyset activate subroutine.

ukeyset init Subroutine

Purpose

Initializes a user-key-set.

Library

Standard C library (libc.a)

Syntax

#include <sys/ukeys.h>

```
int ukeyset init (nset, flags)
ukeyset_t * nset;
unsigned int flags;
```

Description

The ukeyset_init subroutine initializes the user-key set pointed to by the nset parameter. The key-set has read and write accesss enabled for UKEY_PUBLIC alone and disabled for all other keys. If the UK_INIT_ADD_PRIVATE flag is specified, read and write access for all available private user-keys is enabled.

Parameters

nset flags Points to the user-key-set to be initialized.

Must be set to zero for default behavior (only public user-key enabled) or to UK_INIT_ADD_PRIVATE if all private user-keys are also to be

enabled.

Return Values

If successful, the ukeyset_init subroutine returns a value of 0. Otherwise, it returns a value of -1 and sets the errno global variable to indicate the error.

Errors Codes

The **ukeyset_init** subroutine fails if the following are true:

Not valid flags parameter, or NULL or misaligned *nset* parameter. **EINVAL**

ENOSYS Not a user-key enabled process.

Related Information

The ukey_enable subroutine.

The **ukey_setimp** subroutine.

The ukeyset_add_key, ukeyset_remove_key, ukeyset_add_set, ukeyset_remove_set subroutine.

The ukeyset_activate subroutine.

The **ukeyset_ismember** subroutine.

The pthread_attr_getukeyset_np or pthread_attr_setukeyset_np subroutine.

ukeyset ismember Subroutine

Purpose

Tests whether a key exists in a user-key-set.

Library

Standard C library (libc.a)

Syntax

```
#include <sys/ukeys.h>
int ukeyset ismember (uset, ukey, flags)
ukeyset_t * uset;
ukey t ukey;
unsigned int flags;
```

Description

The ukeyset_ismember subroutine tests whether the read or write access specified by the flags parameter for a user-key specified by the ukey parameter is included in the user-key-set pointed to by the uset parameter.

Parameters

uset Points to the user-key-set. ukey User-key whose membership in key-set is to be tested. flags

Must be set to one of the following values:

- · UK_READ Tests for read access
- UK_WRITE Tests for write access
- . UK RW Tests for both read and write access

Return Values

Upon successful completion, the ukeyset ismember subroutine returns a value of 1, if the user-key ukey with the specified access flags is present in the indicated key-set uset. Otherwise, it returns a value of 0. If unsuccessful, the subroutine returns a value of -1, and the **errno** global variable is set to indicate the error.

Errors Codes

The **ukeyset_ismember** subroutine fails if the following is true:

EINVAL Invalid *flags* parameter or invalid *ukey* parameter or invalid key-set parameter.

ENOSYS The process is not a user-key-enabled process.

Related Information

The ukey_enable subroutine.

The **ukeyset_init** subroutine.

The ukeyset add key, ukeyset remove key, ukeyset add set, ukeyset remove set subroutine.

ukey_getkey Subroutine

Purpose

Queries the user-key for application memory.

Syntax

#include <svs/ukevs.h>

int ukey_getkey (void * addr, ukey t * ukey)

Description

The **ukey getkey** subroutine can be used to determine the user-key associated with a memory address. The user-key returned by this service normally corresponds to the values set by the ukey_protect subroutine.

When an application memory can not have its user-key altered or is not part of the application address space. A user-key value of the UKEY_SYSTEM is returned for this memory.

Parameters

addr Specifies the address of the region to be queried. Value for the user-mode storage-key is returned here. ukey

Return Values

When successful, the ukey_getkey subroutine returns a value of 0. Otherwise, it returns a value of -1 and sets the **errno** global variable to indicate the error.

Error Codes

If the ukey_getkey subroutine is unsuccessful, the errno global variable might be set to one of the following values:

EFAULT A part of the buffer pointed to by the *ukey* parameter is out of range or

otherwise inaccessible.

ENOMEM Address is not valid for the address space of the process.

ENOSYS User-keys are not supported.

Related Information

The **ukey_protect** subroutine.

ukey_protect Subroutine

Purpose

Modifies memory's user-key protection.

Syntax

#include <sys/ukeys.h>

int ukey_protect (void * addr, size_t len, ukey_t ukey)

Description

Setting user-keys is available with the ukey_protect(addr,len,prot) protect settings. Attempts to set user-keys with the ukey_protect subroutine fail if keys are not implemented, or the specified user-key is not available. The sysconf(_SC_AIX_UKEYS) must be used to test for the number and presence of user-keys.

One user-key can be associated with a virtual page. The supported values are the **UKEY PUBLIC** and UKEY_PRIVATE1-31 values. A successful call to the ukey_protect() subroutine replaces the region's previous user-key(s) with the value specified by ukey.

A user-key can be set on shared memory regions (shmat()) and applications default data and stack region. When using the ukey protect subroutine on shared memory regions, the region must have write access to the shared memory object (process with the appropriate privileges an effective user ID that matches shm perm.uid or shm perm.cuid). User-keys cannot be altered on files mapped with shmat(), application text, or library regions.

When using the **ukey protect** subroutine to place a private key on memory that is acquired by the **malloc** subroutine, the memory must always be reset to the UKEY PUBLIC key before it is freed.

Parameters

addr Specifies the address of the region to be modified. Must be a multiple of

the page size returned by the vmgetinfo subroutine using the

VM_PAGE_INFO command.

len Specifies the length, in bytes, of the region to be modified. If the *len*

> parameter is not a multiple of the page size returned by the sysconf subroutine using the _SC_PAGE_SIZE value for the Name parameter, an

error is returned.

ukey Specifies the user-key value to associate with the address range.

Return Values

When successful, the ukey_protect subroutine returns a value of 0. Otherwise, it returns a value of -1 and sets the errno global variable to indicate the error.

Error Codes

Attention: If the ukey_protect subroutine is unsuccessful because of a condition other than that specified by the EINVAL error code, the access protection for some pages in the (addr, addr + len) range might have been changed. If the ukey_protect subroutine is unsuccessful, the errno global variable might be set to one of the following values:

EPERM The caller does not have sufficient authority to set a user-key on target

memory.

ENOSYS User-keys are not supported.

EINVAL The *ukey* parameter is not valid, or the *addr* parameter is not a multiple

of the page size as returned by the sysconf subroutine using the

_SC_PAGE_SIZE value for the Name parameter.

EFAULT Address is not valid for the address space of the process.

Related Information

The ukey_getkey Subroutine.

ulimit Subroutine

Purpose

Sets and gets user limits.

Library

Standard C Library (libc.a)

Syntax

The syntax for the ulimit subroutine when the Command parameter specifies a value of GET_FSIZE or SET FSIZE is:

#include <ulimit.h>

```
long int ulimit ( Command, NewLimit)
int Command;
off_t NewLimit;
```

The syntax for the ulimit subroutine when the Command parameter specifies a value of GET DATALIM, SET DATALIM, GET STACKLIM, SET STACKLIM, GET REALDIR, or SET REALDIR is:

```
#include <ulimit.h>
long int ulimit (Command, NewLimit)
int Command;
unsigned long NewLimit;
```

Description

The ulimit subroutine controls process limits.

Even with remote files, the ulimit subroutine values of the process on the client node are used.

Note: Raising the data ulimit does not necessarily raise the program break value. If the proper memory segments are not initialized at program load time, raising your memory limit will not allow access to this memory. Also, without these memory segments initialized, the value returned after such a change may not be the proper break value. If your data limit is RLIM_INFINITY, this value will never advance past the segment size, even if that data is available. Use the -bmaxdata flag of the Id command to set up these segments at load time.

Parameters

Command

Specifies the form of control. The following Command parameter values require that the NewLimit parameter be declared as an off t structure:

GET FSIZE (1)

Returns the process file size limit. The limit is in units of UBSIZE blocks (see the sys/param.h file) and is inherited by child processes. Files of any size can be read. The process file size limit is returned in the off t structure specified by the NewLimit parameter.

SET_FSIZE (2)

Sets the process file size limit to the value in the off t structure specified by the NewLimit parameter. Any process can decrease this limit, but only a process with root user authority can increase the limit. The new file size limit is returned.

The following Command parameter values require that the NewLimit parameter be declared as an integer:

GET_DATALIM (3)

Returns the maximum possible break value (as described in the brk or sbrk subroutine).

SET_DATALIM (1004)

Sets the maximum possible break value (described in the brk and sbrk subroutines). Returns the new maximum break value, which is the NewLimit parameter rounded up to the nearest page boundary.

Note: When a program is executing using the large address-space model, the operating system attempts to modify the soft limit on data size to match the maxdata value. If the maxdata value is larger than the current hard limit on data size, either the program will not execute if the XPG_SUS_ENV environment variable has the value set to ON, or the soft limit will be set to the current hard limit. If the maxdata value is smaller than the size of the program's static data, the program will not execute.

GET_STACKLIM (1005)

Returns the lowest valid stack address.

Note: Stacks grow from high addresses to low addresses.

SET STACKLIM (1006)

Sets the lowest valid stack address. Returns the new minimum valid stack address, which is the *NewLimit* parameter rounded down to the nearest page boundary.

GET_REALDIR (1007)

Returns the current value of the real directory read flag. If this flag is a value of 0, a read system call (or readx with Extension parameter value of 0) against a directory returns fixed-format entries compatible with the System V UNIX operating system. Otherwise, a read system call(or readx with Extension parameter value of 0) against a directory returns the underlying physical format.

SET_REALDIR (1008)

Sets the value of the real directory read flag. If the NewLimit parameter is a value of 0, this flag is cleared; otherwise, it is set. The old value of the real directory read flag is returned.

NewLimit

Specifies the new limit. The value and data type or structure of the NewLimit parameter depends on the Command parameter value that is used.

Examples

To increase the size of the stack by 4096 bytes (use 4096 or PAGESIZE), and set the rc to the new lowest valid stack address, enter:

```
rc = ulimit(SET STACKLIM, ulimit(GET STACKLIM, 0) - 4096);
```

Return Values

Upon successful completion, the value of the requested limit is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

All return values are permissible if the **ulimit** subroutine is successful. To check for error situations, an application should set the errno global variable to 0 before calling the ulimit subroutine. If the ulimit subroutine returns a value of -1, the application should check the errno global variable to verify that it is nonzero.

Error Codes

The **ulimit** subroutine is unsuccessful and the limit remains unchanged if one of the following is true:

EPERM A process without root user authority attempts to increase the file size limit.

EINVAL The Command parameter is a value other than GET FSIZE. SET FSIZE. GET DATALIM.

SET_DATALIM, GET_STACKLIM, SET_STACKLIM, GET_REALDIR, or SET_REALDIR.

umask Subroutine

Purpose

Sets and gets the value of the file creation mask.

Library

Standard C Library (libc.a)

Syntax

```
#include <svs/stat.h>
```

```
mode t umask ( CreationMask)
mode_t CreationMask;
```

Description

The umask subroutine sets the file-mode creation mask of the process to the value of the CreationMask parameter and returns the previous value of the mask.

Whenever a file is created (by the open, mkdir, or mknod subroutine), all file permission bits set in the file mode creation mask are cleared in the mode of the created file. This clearing allows users to restrict the default access to their files.

The mask is inherited by child processes.

Parameters

CreationMask

Specifies the value of the file mode creation mask. The CreationMask parameter is constructed by logically ORing file permission bits defined in the sys/mode.h file. Nine bits of the CreationMask parameter are significant.

Return Values

If successful, the file permission bits returned by the umask subroutine are the previous value of the file-mode creation mask. The CreationMask parameter can be set to this value in subsequent calls to the umask subroutine, returning the mask to its initial state.

umount or uvmount Subroutine

Purpose

Removes a virtual file system from the file tree.

Library

Standard C Library (libc.a)

Syntax

```
int umount ( Device)
char *Device;
#include <sys/vmount.h>
int uvmount ( VirtualFileSystemID, Flag)
int VirtualFileSystemID;
int Flag;
```

Description

The umount and uvmount subroutines remove a virtual file system (VFS) from the file tree.

The umount subroutine unmounts only file systems mounted from a block device (a special file identified by its path to the block device).

In addition to local devices, the uvmount subroutine unmounts local or remote directories, identified by the VirtualFileSystemID parameter.

Only a calling process with root user authority or in the system group and having write access to the mount point can unmount a device, file and directory mount.

Parameters

Device The path name of the block device to be unmounted for the umount

subroutine.

VirtualFileSystemID The unique identifier of the VFS to be unmounted for the **uvmount** subroutine.

This value is returned when a VFS is created by the vmount subroutine and

may subsequently be obtained by the mntctl subroutine. The

VirtualFileSystemID is also reported in the **stat** subroutine st vfs field.

Specifies special action for the uvmount subroutine. Currently only one value is Flag

defined:

UVMNT FORCE

Force the unmount. This flag is ignored for device mounts.

Return Values

Upon successful completion a value of 0 is returned. Otherwise, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The **uvmount** subroutine fails if one of the following is true:

EPERM The calling process does not have write permission to the root of the VFS, the mounted object is a

device or remote, and the calling process does not have root user authority.

EINVAL No VFS with the specified VirtualFileSystemID parameter exists.

EBUSY A device that is still in use is being unmounted.

The **umount** subroutine fails if one of the following is true:

EPERM The calling process does not have root user authority.

ENOENT The *Device* parameter does not exist. ENOBLK The *Device* parameter is not a block device. EINVAL The *Device* parameter is not mounted. EINVAL The *Device* parameter is not local.

EBUSY A process is holding a reference to a file located on the file system.

The **umount** subroutine can be unsuccessful for other reasons. For a list of additional errors, see "Base Operating System Error Codes For Services That Require Path-Name Resolution".

The umount subroutine can be unsuccessful for other reasons. For a list of additional errors, see Appendix A, "Base Operating System Error Codes for Services That Require Path-Name Resolution."

Related Information

The **mount** ("vmount or mount Subroutine" on page 509) subroutine.

The mount command, umount command.

Mounting in Operating system and device management.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

uname or unamex Subroutine

Purpose

Gets the name of the current operating system.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/utsname.h>
int uname ( Name)
struct utsname *Name;
int unamex ( Name)
struct xutsname *Name;
```

Description

The **uname** subroutine stores information identifying the current system in the structure pointed to by the *Name* parameter.

The **uname** subroutine uses the **utsname** structure, which is defined in the **sys/utsname.h** file, and contains the following members:

```
char sysname[SYS_NMLN];
char nodename[SYS_NMLN];
char release[SYS_NMLN];
char wersion[SYS_NMLN];
char machine[SYS_NMLN];
```

The **uname** subroutine returns a null-terminated character string naming the current system in the sysname character array. The nodename array contains the name that the system is known by on a communications network. The release and version arrays further identify the system. The machine array identifies the system unit hardware being used. The utsname.machine field is not unique if the last two characters in the string are 4C. The character string returned by the **uname -Mu** command is unique for all systems and the character string returned by the **uname -MuL** command is unique for all systems.

The **unamex** subroutine uses the **xutsname** structure, which is defined in the **sys/utsname.h** file, and contains the following members:

The xutsname.nid field is the binary form of the utsname.machine field. The xutsname.nid field is not unique if the last two nibbles are 0x4C. The character string returned by the **uname -Mu** command is unique for all systems and the character string returned by the **uname -MuL** command is unique for all partitions in all systems. For local area networks in which a binary node name is appropriate, the xutsname.nid field contains such a name.

Release and version variable numbers returned by the **uname** and **unamex** subroutines may change when new BOS software levels are installed. This change affects applications using these values to access licensed programs. Machine variable changes are due to hardware fixes or upgrades.

Contact the appropriate support organization if your application is affected.

Parameters

Name

A pointer to the utsname or xutsname structure.

Return Values

Upon successful completion, the uname or unamex subroutine returns a nonnegative value. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The **uname** and **unamex** subroutines is unsuccessful if the following is true:

EFAULT The Name parameter points outside of the process address space.

Related Information

The uname command.

ungetc or ungetwc Subroutine

Purpose

Pushes a character back into the input stream.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdio.h>
int ungetc ( Character, Stream)
int Character;
FILE *Stream;
wint t ungetwc (Character, Stream)
wint t Character;
FILE *Stream;
```

Description

The **ungetc** and **ungetwc** subroutines insert the character specified by the *Character* parameter (converted to an unsigned character in the case of the ungetc subroutine) into the buffer associated with the input stream specified by the Stream parameter. This causes the next call to the getc or getwc subroutine to return the Character value. A successful intervening call (with the stream specified by the Stream parameter) to a file-positioning subroutine (fseek, fsetpos, or rewind) discards any inserted characters for the stream. The ungetc and ungetwc subroutines return the Character value, and leaves the file (in its externally stored form) specified by the Stream parameter unchanged.

You can always push one character back onto a stream, provided that something has been read from the stream or the **setbuf** subroutine has been called. If the **ungetc** or **ungetwc** subroutine is called too many times on the same stream without an intervening read or file-positioning operation, the operation may not be successful. The **fseek** subroutine erases all memory of inserted characters.

The ungetc and ungetwc subroutines return a value of EOF or WEOF if a character cannot be inserted.

A successful call to the **ungetc** or **ungetwc** subroutine clears the end-of-file indicator for the stream specified by the Stream parameter. The value of the file-position indicator after all inserted characters are read or discarded is the same as before the characters were inserted. The value of the file-position indicator is decreased after each successful call to the ungetc or ungetwc subroutine. If its value was 0 before the call, its value is indeterminate after the call.

Parameters

Character Specifies a character. Specifies the input stream. Stream

Return Values

The ungetc and ungetwc subroutines return the inserted character if successful; otherwise, EOF or WEOF is returned, respectively.

unlink Subroutine

Purpose

Removes a directory entry.

Library

Standard C Library (libc.a)

Syntax

#include <unistd.h>

int unlink (Path) const char *Path;

Description

The **unlink** subroutine removes the directory entry specified by the *Path* parameter and decreases the link count of the file referenced by the link. If Network File System (NFS) is installed on your system, this path can cross into another node.

Attention: Removing a link to a directory requires root user authority. Unlinking of directories is strongly discouraged since erroneous directory structures can result. The rmdir subroutine should be used to remove empty directories.

When all links to a file are removed and no process has the file open, all resources associated with the file are reclaimed, and the file is no longer accessible. If one or more processes have the file open when the last link is removed, the directory entry disappears. However, the removal of the file contents is postponed until all references to the file are closed.

If the parent directory of Path has the **sticky** attribute (described in the **mode.h** file), the calling process must have root user authority or an effective user ID equal to the owner ID of Path or the owner ID of the parent directory of *Path*.

The st ctime and st mtime fields of the parent directory are marked for update if the unlink subroutine is successful. In addition, if the file's link count is not 0, the st ctime field of the file will be marked for update.

Applications should use the **rmdir** subroutine to remove a directory. If the *Path* parameter names a symbolic link, the link itself is removed.

Parameters

Path Specifies the directory entry to be removed.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned, the errno global variable is set to indicate the error, and the specified file is not changed.

Error Codes

The unlink subroutine fails and the named file is not unlinked if one of the following is true:

ENOENT The named file does not exist.

EACCES Write permission is denied on the directory containing the link to be removed.

EBUSY The entry to be unlinked is the mount point for a mounted filesystem, or the file named by Path is a

named STREAM.

EPERM The file specified by the Path parameter is a directory, and the calling process does not have root user

authority.

EPERM is also returned if the file named by the *Path* parameter is a directory in a JFS2 file system. Note

that JFS allows you to unlink a directory.

EROFS The entry to be unlinked is part of a read-only file system.

The unlink subroutine can be unsuccessful for other reasons. For a list of additional errors, see Appendix A, "Base Operating System Error Codes for Service That Require Path-Name Resolution"

If NFS is installed on the system, the **unlink** subroutine can also fail if the following is true:

ETIMEDOUT The connection timed out.

Related Information

The **rm** command.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

unload and terminateAndUnload Subroutines

Purpose

Unloads a module.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/ldr.h>
int unload( FunctionPointer)
int (*FunctionPointer)();
int terminateAndUnload( FunctionPointer)
int (*FunctionPointer)();
```

Description

The unload and terminateAndUnload subroutines unload the specified module and its dependents. The value returned by the load subroutine is passed to the unload subroutine as FunctionPointer. The unload subroutine calls termination routines (fini routines) for the specified module and any of its dependents that are not being used by any other module.

The unload and terminateAndUnload subroutines free the storage used by the specified module only if the module is no longer in use. A module is in use as long as any other module that is in use imports symbols from it.

The unload subroutine does not perform C++ termination, that is, calling destructors. Use the terminateAndUnload subroutine instead. The diclose subroutine performs C++ termination like the terminateAndUnload subroutine does.

When a module is unloaded, any deferred resolution symbols that were bound to the module remain bound. These bindings create references to the module that cannot be undone, even with the unload subroutine.

(This paragraph only applies to AIX 4.3.1 and previous releases.) When a process is executing under ptrace control, portions of the process's address space are recopied after the unload processing completes. For a 32-bit process, the main program text (loaded in segment 1) and shared library modules (loaded in segment 13) are recopied. Any breakpoints or other modifications to these segments must be reinserted after the unload call. For a 64-bit process, shared library modules are recopied after an unload call. The debugger will be notified by setting the W SLWTED flag in the status returned by wait, so that it can reinsert breakpoints.

(This paragraph only applies to AIX 4.3.2 and later releases.) When a process executing under ptrace control calls unload, the debugger is notified by setting the W_SLWTED flag in the status returned by wait. If a module loaded in the shared library is no longer in use by the process, the module is deleted from the process's copy of the shared library segment by freeing the pages containing the module.

Parameters

FunctionPointer

Specifies the name of the function returned by the load subroutine.

Return Values

Upon successful completion, the unload and terminateAndUnload subroutines return a value of 0, even if the module couldn't be unloaded because it is still in use.

Error Codes

If the unload and terminateAndUnload subroutines fail, a value of -1 is returned, the program is not unloaded, and **errno** is set to indicate the error. **errno** may be set to one of the following:

EINVAL

The FunctionPointer parameter does not correspond to a program loaded by the load subroutine.

Related Information

The load and loadAndInit subroutine, loadbind subroutine, loadquery subroutine, dlclose subroutine.

The **Id** command.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

unlockpt Subroutine

Purpose

Unlocks a pseudo-terminal device.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h>

int unlockpt (FileDescriptor) int FileDescriptor;

Description

The unlockpt subroutine unlocks the slave peudo-terminal device associated with the master peudo-terminal device defined by the FileDescriptor parameter. This subroutine has no effect if the environment variable XPG SUS ENV is not set equal to the string "ON", or if the BSD PTY driver is used.

Parameters

FileDescriptor

Specifies the file descriptor of the master pseudo-terminal device.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Related Information

The grantpt subroutine.

The Input and Output Handling Programmer's Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

usrinfo Subroutine

Purpose

Gets and sets user information about the owner of the current process.

Library

Standard C Library (libc.a)

Syntax

```
#include <uinfo.h>
int usrinfo ( Command, Buffer, Count)
int Command;
char *Buffer;
int Count;
```

Description

The **usrinfo** subroutine gets and sets information about the owner of the current process. The information is a sequence of null-terminated *name=value* strings. The last string in the sequence is terminated by two successive null characters. A child process inherits the user information of the parent process.

Parameters

Command

Specifies one of the following constants:

GETUINFO

Copies user information, up to the number of bytes specified by the *Count* parameter, into the buffer pointed to by the *Buffer* parameter.

SETUINFO

Sets the user information for the process to the number of bytes specified by the *Count* parameter in the buffer pointed to by the *Buffer* parameter. The calling process must have root user authority to set the user information.

The minimum user information consists of four strings typically set by the **login** program:

NAME=UserName

LOGIN=LoginName

LOGNAME=LoginName

TTY=TTYName

If the process has no terminal, the TTYName parameter should be null.

Buffer Specifies a pointer to a user buffer. This buffer is usually **UINFOSIZ** bytes long.

Count Specifies the number of bytes of user information copied from or to the user buffer.

Return Values

If successful, the **usrinfo** subroutine returns a non-negative integer giving the number of bytes transferred. Otherwise, a value of -1 is returned and the errno global variable is set to indicate the error.

Error Codes

The usrinfo subroutine fails if one of the following is true:

The Command parameter is set to SETUINFO, and the calling process does not have root user authority. **EPERM**

EINVAL The Command parameter is not set to **SETUINFO** or **GETUINFO**.

EINVAL The Command parameter is set to SETUINFO, and the Count parameter is larger than UINFOSIZ.

The Buffer parameter points outside of the address space of the process. **EFAULT**

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

utimes or utime Subroutine

Purpose

Sets file-access and modification times.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/time.h>
int utimes ( Path, Times)
char *Path;
struct timeval Times[2];
#include <utime.h>
int utime ( Path, Times)
const char *Path;
const struct utimbuf *Times;
```

Description

The **utimes** subroutine sets the access and modification times of the file pointed to by the *Path* parameter to the value of the *Times* parameter. This subroutine allows time specifications accurate to the second.

The utime subroutine also sets file access and modification times. Each time is contained in a single integer and is accurate only to the nearest second. If successful, the utime subroutine marks the time of the last file-status change (st_ctime) to be updated.

Microsecond time stamps are not implemented, even though the utimes subroutine provides a way to specify them.

Parameters

Path Points to the file.

Times

Specifies the date and time of last access and of last modification. For the utimes subroutine, this is an array of timeval structures, as defined in the sys/time.h file. The first array element represents the date and time of last access, and the second element represents the date and time of last modification. The times in the timeval structure are measured in seconds and microseconds since 00:00:00 Greenwich Mean Time (GMT), 1 January 1970, rounded to the nearest second.

For the **utime** subroutine, this parameter is a pointer to a **utimbuf** structure, as defined in the **utime**.h file. The first structure member represents the date and time of last access, and the second member represents the date and time of last modification. The times in the utimbuf structure are measured in seconds since 00:00:00 Greenwich Mean Time (GMT), 1 January 1970.

If the Times parameter has a null value, the access and modification times of the file are set to the current time. If the file is remote, the current time at the remote node, rather than the local node, is used. To use the call this way, the effective user ID of the process must be the same as the owner of the file or must have root authority, or the process must have write permission to the file.

If the *Times* parameter does not have a null value, the access and modification times are set to the values contained in the designated structure, regardless of whether those times are the same as the current time. Only the owner of the file or a user with root authority can use the call this way.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned, the errno global variable is set to indicate the error, and the file times are not changed.

Error Codes

The **utimes** or **utime** subroutine fails if one of the following is true:

The Times parameter is not null and the calling process neither owns the file nor has root user authority.

EACCES The Times parameter is null, effective user ID is neither the owner of the file nor has root authority, or

write access is denied.

EROFS The file system that contains the file is mounted read-only.

The utimes or utime subroutine can be unsuccessful for other reasons. For a list of additional errors, see "Base Operating System Error Codes For Services That Require Path-Name Resolution."

The utimes or utime subroutine can be unsuccessful for other reasons. For a list of additional errors, see Appendix A, "Base Operating System Error Codes For Services That Require Path-Name Resolution."

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

varargs Macros

Purpose

Handles a variable-length parameter list.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdarg.h>
type va_arg ( Argp, Type)
va_list Argp;
void va_start (Argp, ParmN)
va_list Argp;
void va_end (Argp)
va list Argp;
0R
#include <varargs.h>
va alist Argp;
va dcl
void va start (Argp)
va list Argp;
type va_arg (Argp, Type)
va_list Argp;
void va_end (Argp)
va_list Argp;
```

Description

The varargs set of macros allows you to write portable subroutines that accept a variable number of parameters. Subroutines that have variable-length parameter lists (such as the printf subroutine), but that do not use the varargs macros, are inherently nonportable because different systems use different parameter-passing conventions.

Note: Do not include both <stdarg.h> and <varargs.h>. Use of <varargs.h> is not recommended. It is supplied for backwards compatibility.

For <stdarg.h>

va start

Initializes the Arap parameter to point to the beginning of the list. The ParmN parameter identifies the rightmost parameter in the function definition. For compatibility with previous programs, it defaults to the address of the first parameter on the parameter list. Acceptable parameters include: integer, double, and pointer. The va_start macro is started before any access to the unnamed arguments.

For <varargs.h>

va alist A variable used as the parameter list in the function header.

va_argp A variable that the varargs macros use to keep track of the current location in the parameter list. Do

not modify this variable.

va_dcl Declaration for va_alist. No semicolon should follow va_dcl.va_start Initializes the *Argp* parameter to point to the beginning of the list.

For <stdarg.h> and <varargs.h>

va_list Defines the type of the variable used to traverse the list.

va_arg
Returns the next parameter in the list pointed to by the Argp parameter.

va_end Cleans up at the end.

Your subroutine can traverse, or scan, the parameter list more than once. Start each traversal with a call to the **va_start** macro and end it with the **va_end** macro.

Note: The calling routine is responsible for specifying the number of parameters because it is not always possible to determine this from the stack frame. For example, **execl** is passed a null pointer to signal the end of the list. The **printf** subroutine determines the number of parameters from its *Format* parameter.

Parameters

Argp Specifies a variable that the **varargs** macros use to keep track of the current location in the parameter list. Do not modify this variable.

Type Specifies the type to which the expected argument will be converted when passed as an argument. In C, arguments that are char or short should be accessed as int; unsigned char or short arguments are converted to unsigned int, and float arguments are converted to double. Different types can be mixed, but it is up to the routine to know what type of argument is expected, because it cannot be determined at runtime.

ParmN Specifies a parameter that is the identifier of the rightmost parameter in the function definition.

Examples

The following **execl** system call implementations are examples of the **varargs** macros usage.

1. The following example includes <stdarg.h>:

```
#include <stdarg.h>
#define MAXargs 31
int execl (const char *path, ...)
{
    va_list Argp;
    char *array [MAXargs];
    int argno=0;
    va_start (Argp, path);
    while ((array[argno++] = va_arg(Argp, char*)) != (char*)0)
        ;
    va_end(Argp);
    return(execv(path, array));
}
main()
{
    execl("/usr/bin/echo", "ArgV[0]", "This", "Is", "A", "Test",
    /* ArguementV[0] will be discarded by the execv in main(): */
    /* by convention ArgV[0] should be a copy of path parameter */
}
```

2. The following example includes <varargs.h>:

```
#include <varargs.h>
#define MAXargS 100
/*
   execl is called by
**
** execl(file, arg1, arg2, . . . , (char *) 0);
*/
execl(va alist)
  va_dcl
{ va_list ap;
   char *file;
   char *args[MAXargS];
   int argno = 0;
   va start(ap);
   file = va_arg(ap, char *);
   while ((args[argno++] = va arg(ap, char *)) != (char *) 0)
     ; /* Empty loop body */
   va end(ap);
   return (execv(file, args));
```

Related Information

The exec subroutines.

The **printf** subroutine.

List of String Manipulation Services in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

vfscanf, vscanf, or vsscanf Subroutine

Purpose

Formats input of an argument list.

Syntax

```
#include <stdarg.h>
#include <stdio.h>
int vfscanf (stream, format, arg)
File *restrict stream
const char format;
va_list arg;
int vscanf (format, arg)
const char format;
va_list arg;
int vsscanf (format, arg)
const char format;
va_list arg;
```

Description

The vscanf, vfscanf, and vsscanf subroutines are equivalent to the scanf, fscanf, and sscanf subroutines, respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined in the <stdarg.h> header file. These subroutines do not invoke the va_end macro. As these functions invoke the va_arg macro, the value of ap after the return is unspecified.

Parameters

stream format arg

Return Values

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If a read error occurs, the error indicator for the stream is set, EOF shall be returned, and errno shall be set to indicate the error.

Related Information

The "scanf, fscanf, sscanf, or wsscanf Subroutine" on page 132.

vfwscanf, vswscanf, or vwscanf Subroutine

Purpose

Wide-character formatted input of the argument list.

Syntax

```
#include <stdarg.h>
#include <stdio.h>
#include <wchar.h>
int vfwscanf (stream, format, arg)
FILE *restrict stream;
const wchar_t format;
va_list arg;
int vswscanf (ws, format, arg)
const wchar t *restrict ws;
const wchar_t format;
va_list arg;
int vwscanf (format, arg)
const wchar_t format;
va list arg;
```

Description

The vfwscanf, vswscanf, and vwscanf subroutines are equivalent to the fwscanf, swscanf, and wscanf subroutines, respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined in the <stdarg.h> header file. These subroutines do not invoke the va_end macro. As these subroutines invoke the va_arg macro, the value of ap after the return is unspecified.

Return Values

Upon successful completion, the vfwscanf, vswscanf, and vwscanf subroutines return the number of successfully matched and assigned input items. This number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF is returned. If a read error occurs, the error indicator for the stream is set, EOF is returned, and the errno global variable is set to indicate the error.

Related Information

fwscanf, wscanf, swscanf Subroutines in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

vfwprintf, vwprintf Subroutine

Purpose

Wide-character formatted output of a stdarg argument list.

Library

Standard library (libc.a)

Syntax

```
#include <stdarg.h>
#include <stdio.h>
#include <wchar.h>
int vwprintf ((const wchar_t * format, va_list arg);
int vfwprintf(FILE * stream, const wchar_t * format, va_list arg);
int vswprintf (wchar t * s, size t n, const wchar t * format, va list arg);
```

Description

The vwprintf, vfwprintf and vswprintf functions are the same as wprintf, fwprintf and swprintf respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined by stdarg.h.

These functions do not invoke the va_end macro. However, as these functions do invoke the va_arg macro, the value of ap after the return is indeterminate.

Return Values

Refer to fwprintf.

Error Codes

Refer to fwprintf.

Related Information

The **fwprintf** subroutine.

vmgetinfo Subroutine

Purpose

Retrieves Virtual Memory Manager (VMM) information.

Library

Standard C Library (libc.a)

Syntax

#include <sys/vminfo.h>

int vmgetinfo(void *out, int command, int arg)

Description

The **vmgetinfo** subroutine returns the current value of certain VMM parameters.

Parameters

arg command Additional parameter which depends on the command parameter.

Specifies which information should be returned. The command parameter has the following valid value:

VMINFO

Returns the content of the vminfo structure (described in the sys/vminfo.h file). The out parameter points to a vminfo structure and arg is the size of this structure. The smaller value of the arg parameter or sizeof (struct vminfo) is copied.

VMINFO64

Returns the contents of the vminfo64 structure (described in the sys/vminfo.h file). The *out* parameter points to a **vminfo64** structure and the *arg* parameter is the size of the vminfo64 structure. The smaller value of the arg parameter and sizeof (struct vminfo64) is copied.

VM_PAGE_INFO

The size, in bytes, of the page backing the address specified in the addr field of the vm_page_info structure (described in sys/vminfo.h) is returned. The *out* parameter should point to a vm_page_info structure with the addr field set to the desired address of which to query the page size. The arg parameter should be the size of the **vm_page_info** structure.

VM_NEW_HEAP_PSIZE

Sets a new preferred page size for future sbreak allocations for the calling process's private data heap. This page size setting is advisory. The out parameter should be a pointer to a psize t structure that contains the preferred page size, in bytes, to use to back any future sbreak allocations by the calling process. Presently, only 16M (0x1000000) and 4K (0x1000) are supported. The arg parameter should be that of the *sizeof*(**psize_t**).

VM_STAGGER_DATA

Staggers the calling process's current **sbreak** value by a cumulative per-MCM stagger value. This stagger value must be set through the vmo option data_stagger_interval. The out and arg arguments should be NULL and 0, respectively.

IPC_LIMITS

The content of the ipc limits struct (described in the sys/vminfo.h file) is returned. The out parameter should point to an ipc_limits structure and arg should be the size of this structure. The smaller of the arg or size of (struct ipc limits) parameters will be copied. The ipc_limits struct contains the inter-process communication (IPC) limits for the system.

VMINFO_GETPSIZES

Reports a system's supported page sizes. When the value of arg is set to 0, the out parameter is ignored, and the number of supported page sizes is returned. When the value of arg is greater than 0, the arg parameter value indicates the number of page sizes to report, and the out parameter must be a pointer to an array with the number of psize_t structures specified by the arg parameter. The array of the psize t structure is updated with the system's supported page sizes in sorted order starting with the smallest supported page size. The number of array entries updated with page sizes is returned.

VMINFO PSIZE

Reports detailed VMM statistics for a specified page size. The *out* parameter must point to a vminfo psize structure with the psize field set to a page size, in bytes, for which to return statistics. The arg parameter value should be set to the size of the **vminfo_psize** structure.

Return Values

For all commands other than VMINFO_GETPSIZES, 0 is returned if the vmgetinfo subroutine is successful. When VMINFO_GETPSIZES is specified as the command, a number of page sizes is returned if the vmgetinfo subroutine is successful.

If the vmgetinfo subroutine is unsuccessful, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The vmgetinfo subroutine does not succeed if the following are true:

EFAULT	The copy operation to the buffer was not successful.
EFAULT	Attempt at reading the page size pointed to by the <i>out</i> parameter was not successful.
EINVAL	When VM_PAGE_INFO is the command, the <i>addr</i> field of the vm_page_info structure is an invalid address.
EINVAL	When VM_NEW_HEAP_PSIZE is the command, the arg parameter is not set to the size of psize_t.
EINVAL	When VM_STAGGER_DATA is the command, the <i>out</i> parameter is not set to NULL, or the <i>arg</i> parameter is not set to 0.
EINVAL	When VMINFO_PSIZE is the command, the psize field of the vminfo_psize structure is an unsupported page size, the <i>arg</i> parameter is less than the size of a psize_t , or the <i>out</i> parameter is NULL.
EINVAL	When VMINFO_GETPSIZES is the command, the <i>arg</i> parameter is less than 0, or the <i>out</i> parameter is NULL when the <i>arg</i> parameter is non-zero.
ENOMEM	When VM_STAGGER_DATA is the command, the calling process's data could not be staggered because of resource limitations on the process's data size. (Use ulimit data to increase the allowed data for this process. See the "ulimit Subroutine" on page 488.)
ENOMEM	When VM_NEW_HEAP_PSIZE is the command, the break value of the process could not be adjusted because of resource limitations. (See the "ulimit Subroutine" on page 488.)
ENOSYS	The <i>command</i> parameter is not valid (or not yet implemented).
ENOSYS	Not implemented in current version of AIX (or on 32-bit kernel).
ENOTSUP	When VM_NEW_HEAP_PSIZE is the command, the calling process is not 64-bit.
ENOTSUP	When VM_STAGGER_DATA is the command, the calling process is not 64-bit.
EPERM	When VM_NEW_HEAP_PSIZE is the command, the user does not have permission to use the

Examples

The following example demonstrates how an application could determine a system's supported page sizes with the **vmgetinfo()** subroutine:

```
int num psizes;
psize t *psizes;
/* Determine the number of supported page sizes */
num psizes = vmgetinfo(NULL, VMINFO GETPSIZES, 0);
if ((psizes = malloc(num psizes*sizeof(psize t))) == NULL)
return(1);
/* Get the page sizes */
if (vmgetinfo(psizes, VMINFO GETPSIZES, num psizes)!= num psizes)
perror("vmgetinfo() unexpectedly failed");
return(2);
```

requested page size.

```
/* psize[0] = smallest page size
* psize[1] = next smallest page size...
* psize[num_psizes-1] = largest supported page size
```

Related Information

The "ulimit Subroutine" on page 488.

vmount or mount Subroutine

Purpose

Makes a file system available for use.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/types.h>
#include <sys/vmount.h>
int vmount ( VMount, Size)
struct vmount *VMount;
int Size;
int mount
( Device, Path, Flags)
char *Device;
char *Path;
int Flags;
```

Description

The vmount subroutine mounts a file system, thereby making the file available for use. The vmount subroutine effectively creates what is known as a virtual file system. After a file system is mounted, references to the path name that is to be mounted over refer to the root directory on the mounted file system.

A directory can only be mounted over a directory, and a file can only be mounted over a file. (The file or directory may be a symbolic link.)

Therefore, the **vmount** subroutine can provide the following types of mounts:

- · A local file over a local or remote file
- A local directory over a local or remote directory
- · A remote file over a local or remote file
- A remote directory over a local or remote directory.

A mount to a directory or a file can be issued if the calling process has root user authority or is in the system group and has write access to the mount point.

To mount a block device, remote file, or remote directory, the calling process must also have root user authority.

The mount subroutine only allows mounts of a block device over a local directory with the default file system type. The mount subroutine searches the /etc/filesystems file to find a corresponding stanza for the desired file system.

Note: The mount subroutine interface is provided only for compatibility with previous releases of the operating system. The use of the **mount** subroutine is strongly discouraged by normal application programs.

If the directory you are trying to mount over has the sticky bit set to on, you must either own that directory or be the root user for the mount to succeed. This restriction applies only to directory-over-directory mounts.

Parameters

Device

A path name identifying the block device (also called a special file) that contains the physical file system.

Path A path name identifying the directory on which the file system is to be mounted.

Values that define characteristics of the object to be mounted. Currently these values are defined Flags in the /usr/include/sys/vmount.h file:

MNT READONLY

Indicates that the object to be mounted is read-only and that write access is not allowed. If this value is not specified, writing is permitted according to individual file accessibility.

MNT_NOSUID

Indicates that setuid and setgid programs referenced through the mount should not be executable. If this value is not specified, setuid and setgid programs referenced through the mount may be executable.

MNT NODEV

Indicates that opens of device special files referenced through the mount should not succeed. If this value is not specified, opens of device special files referenced through the mount may succeed.

VMount

A pointer to a variable-length **vmount** structure. This structure is defined in the **sys/vmount.h** file.

The following fields of the VMount parameter must be initialized before the call to the vmount subroutine:

vmt revision

The revision code in effect when the program that created this virtual file system was compiled. This is the value VMT_REVISION.

vmt_length

The total length of the structure with all its data. This must be a multiple of the word size (4 bytes) and correspond with the Size parameter.

vmt_flags

Contains the general mount characteristics. The following value may be specified:

MNT READONLY

A read-only virtual file system is to be created.

vmt gfstype

The type of the generic file system underlying the VMT_OBJECT. Values for this field are defined in the sys/vmount.h file and include:

MNT JFS

Indicates the native file system.

MNT NFS

Indicates a Network File System client.

MNT_CDROM

Indicates a CD-ROM file system.

vmt data

An array of structures that describe variable length data associated with the **vmount** structure. The structure consists of the following fields:

vmt off

The offset of the data from the beginning of the **vmount** structure.

vmt_size

The size, in bytes, of the data.

The array consists of the following fields:

vmt data[VMT OBJECT]

Specifies he name of the device, directory, or file to be mounted.

vmt data[VMT STUB]

Specifies the name of the device, directory, or file to be mounted over.

vmt data[VMT HOST]

Specifies the short (binary) name of the host that owns the mounted object. This need not be specified if VMT OBJECT is local (that is, it has the same vmt gfstype as / (root), the root of all file systems).

vmt_data[VMT_HOSTNAME]

Specifies the long (character) name of the host that owns the mounted object. This need not be specified if VMT OBJECT is local.

vmt_data[VMT_INFO]

Specifies binary information to be passed to the generic file-system implementation that supports VMT_OBJECT. The interpretation of this field is specific to the gfs_type.

vmt data[VMT_ARGS]

Specifies a character string representation of VMT_INFO.

On return from the **vmount** subroutine, the following additional fields of the *VMount* parameter are initialized:

vmt fsid

Specifies the two-word file system identifier; the interpretation of this identifier depends on the gfs_type.

vmt vfsnumber

Specifies the unique identifier of the virtual file system. Virtual file systems do not survive the IPL; neither does this identifier.

vmt_time

Specifies the time at which the virtual file system was created.

Size Specifies the size, in bytes, of the supplied data area.

Return Values

Upon successful completion, a value of 0 is returned. Otherwise, a value of -1 is returned, and the errno global variable is set to indicate the error.

Error Codes

The mount and vmount subroutines fail and the virtual file system is not created if any of the following is true:

EACCES The calling process does not have write permission on the stub directory (the directory to be mounted

over).

EBUSY VMT_OBJECT specifies a device that is already mounted or an object that is open for writing, or the

kernel's mount table is full.

EFAULT The VMount parameter points to a location outside of the allocated address space of the process.

EFBIG The size of the file system is too big.

EFORMAT An internal inconsistency has been detected in the file system.

EINVAL The contents of the VMount parameter are unintelligible (for example, the vmt qfstype is

unrecognizable, or the file system implementation does not understand the VMT_INFO provided).

ENOSYS The file system type requested has not been configured. **ENOTBLK** The object to be mounted is not a file, directory, or device. **ENOTDIR** The types of VMT_OBJECT and VMT_STUB are incompatible.

EPERM VMT_OBJECT specifies a block device, and the calling process does not have root user authority. **EROFS**

An attempt has been made to mount a file system for read/write when the file system cannot support

writing.

The mount and vmount subroutines can also fail if additional errors occur.

Related Information

The **mntctl** subroutine, **umount** ("umount or uvmount Subroutine" on page 491) subroutine.

The **mount** command, **umount** command.

Files, Directories, and File Systems for Programmers in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

vsnprintf Subroutine

Purpose

Print formatted output.

Library

Standard library (libc.a)

Syntax

#include <stdarg.h> #include <stdio.h>

int vsnprintf(char * s, size t n, const char * format, va list ap)

Description

Refer to vfprintf.

vwsprintf Subroutine

Purpose

Writes formatted wide characters.

Library

Standard C Library (libc.a)

Syntax

```
#include <wchar.h>
#include <stdarg.h>
int vwsprintf (wcs, Format, arg)
wchar_t * wcs;
const char * Format;
va list arg;
```

Description

The vwsprintf subroutine writes formatted wide characters. It is structured like the vsprintf subroutine with a few differences. One difference is that the wcs parameter specifies a wide character array into which the generated output is to be written, rather than a character array. The second difference is that the meaning of the S conversion specifier is always the same in the case where the # flag is specified. If copying takes place between objects that overlap, the behavior is undefined.

Parameters

Specifies the array of wide characters where the output is to be written. WCS

Format Specifies a multibyte character sequence composed of zero or more directives (ordinary multibyte

characters and conversion specifiers). The new formats added to handle the wide characters are:

%C Formats a single wide character.

%S Formats a wide character string.

Specifies the parameters to be printed. arg

Return Values

The vwsprintf subroutine returns the number of wide characters (not including the terminating wide character null) written into the wide character array and specified by the wcs parameter.

Related Information

The vsprintf subroutine.

The **printf** command.

National Language Support Overview in AIX 5L Version 5.3 National Language Support Guide and Reference.

wait, waitpid, wait3, or wait364 Subroutine

Purpose

Waits for a child process to stop or terminate.

Library

Standard C Library (libc.a)

Syntax

```
#include <sys/wait.h>
pid t wait ( StatusLocation)
int *StatusLocation;
pid t wait ((void *) 0)
#include <sys/wait.h>
pid t waitpid ( ProcessID,
StatusLocation, Options)
int *StatusLocation;
pid t ProcessID;
int Options;
#include <sys/time.h>
#include <sys/resource.h>
#include <sys/wait.h>
pid t wait3 (StatusLocation, Options, ResourceUsage)
int *StatusLocation;
int Options;
struct rusage *ResourceUsage;
pid t wait364 (StatusLocation, Options, ResourceUsage)
int *StatusLocation;
int Options;
struct rusage64 *ResourceUsage;
```

Description

The wait subroutine suspends the calling thread until the process receives a signal that is not blocked or ignored, or until any one of the calling process' child processes stops or terminates. The wait subroutine returns without waiting if the child process that has not been waited for has already stopped or terminated prior to the call.

Note: The effect of the wait subroutine can be modified by the setting of the SIGCHLD signal. See the sigaction ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine for details.

The waitpid subroutine includes a ProcessID parameter that allows the calling thread to gather status from a specific set of child processes, according to the following rules:

- If the ProcessID value is equal to a value of -1, status is requested for any child process. In this respect, the waitpid subroutine is equivalent to the wait subroutine.
- A ProcessID value that is greater than 0 specifies the process ID of a single child process for which status is requested.
- If the ProcessID parameter is equal to 0, status is requested for any child process whose process group. ID is equal to that of the calling thread's process.
- If the ProcessID parameter is less than 0, status is requested for any child process whose process group ID is equal to the absolute value of the *ProcessID* parameter.

The waitpid, wait3, and wait364 subroutine variants provide an Options parameter that can modify the behavior of the subroutine. Two values are defined, WNOHANG and WUNTRACED, which can be combined by specifying their bitwise-inclusive OR. The WNOHANG option prevents the calling thread from being suspended even if there are child processes to wait for. In this case, a value of 0 is returned indicating there are no child processes that have stopped or terminated. If the WUNTRACED option is set, the call should also return information when children of the current process are stopped because they received a SIGTTIN, SIGTTOU, SIGSSTP, or SIGTSTOP signal.

The wait364 subroutine can be called to make 64-bit rusage counters explicitly available in a 32-bit environment.

In AIX 5.1 and later, 64-bit quantities are also available to 64-bit applications through the wait3() interface in the ru utime and ru stime fields of struct rusage.

When a 32-bit process is being debugged with ptrace, the status location is set to W_SLWTED if the process calls **load**, **unload**, or **loadbind**. When a 64-bit process is being debugged with **ptrace**, the status location is set to W_SLWTED if the process calls load or unload.

If multiprocessing debugging mode is enabled, the status location is set to W_SEWTED if a process is stopped during an exec subroutine and to **W SFWTED** if the process is stopped during a fork subroutine.

If more than one thread is suspended awaiting termination of the same child process, exactly one thread returns the process status at the time of the child process termination.

If the WCONTINUED option is set, the call should return information when the children of the current process have been continued from a job control stop but whose status has not yet been reported.

Parameters

StatusLocation Points to integer variable that contains (or will contain) the child process termination

status, as defined in the sys/wait.h file.

ProcessID Specifies the child process. **Options** Modifies behavior of subroutine.

Specifies the location of a structure to be filled in with resource utilization information for ResourceUsage

terminated children.

Macros

The value pointed to by StatusLocation when wait, waitpid, or wait3 subroutines are returned, can be used as the Returned Value parameter for the following macros defined in the sys/wait.h file to get more information about the process and its child process.

WIFCONTINUED (Returned Value) pid t ReturnedValue;

Returns a nonzero value if status returned for a child process that has continued from a job control stop.

WIFSTOPPED (Returned Value)

int ReturnedValue;

Returns a nonzero value if status returned for a stopped child.

WSTOPSIG(ReturnedValue)

int ReturnedValue:

Returns the number of the signal that caused the child to stop.

WIFEXITED(ReturnedValue)

int ReturnedValue;

Returns a nonzero value if status returned for normal termination.

WEXITSTATUS (Returned Value)

int ReturnedValue;

Returns the low-order 8 bits of the child exit status.

WIFSIGNALED (Returned Value)

int ReturnedValue;

Returns a nonzero value if status returned for abnormal termination.

WTERMSIG(ReturnedValue)

int ReturnedValue;

Returns the number of the signal that caused the child to terminate.

Return Values

If the wait subroutine is unsuccessful, a value of -1 is returned and the errno global variable is set to indicate the error. In addition, the waitpid, wait3, and wait364 subroutines return a value of 0 if there are no stopped or exited child processes, and the WNOHANG option was specified. The wait subroutine returns a 0 if there are no stopped or exited child processes, also.

Error Codes

The wait, waitpid, wait3, and wait364 subroutines are unsuccessful if one of the following is true:

ECHILD The calling thread's process has no existing unwaited-for child processes.

EINTR This subroutine was terminated by receipt of a signal.

EFAULT The StatusLocation or ResourceUsage parameter points to a location outside of the address space of the

process.

The waitpid subroutine is unsuccessful if the following is true:

ECHILD The process or process group ID specified by the ProcessID parameter does not exist or is not a child

process of the calling process.

The waitpid and wait3 subroutines are unsuccessful if the following is true:

EINVAL The value of the Options parameter is not valid.

The exec subroutine, exit, exit, or atexit subroutine, fork subroutine, getrusage subroutine, pause subroutine, **ptrace** subroutine, **sigaction** ("sigaction, sigvec, or signal Subroutine" on page 213) subroutine.

waitid Subroutine

Purpose

Waits for a child process to change state.

Library

Standard C Library (libc.a)

Syntax

#include <sys/wait.h>;

int waitid (idtype, id, infop, options)

idtype_t idtype; id t id; siginfo t *infop; int options;

Description

The waitid subroutine suspends the calling thread until one child of the process containing the calling thread changes state. It records the current state of a child in the structure pointed to by the infop parameter. If a child process changed state prior to the call to the waitid subroutine, the waitid subroutine returns immediately. If more than one thread is suspended in the wait or waitpid subroutines waiting for termination of the same process, exactly one thread will return the process status at the time of the target process termination.

Parameters

idtype Specifies the child process. Specifies the child process. id

Specifies the location of a siginfo_t structure to be filled in with resource utilization infop

information.

options Specifies which state changes the waitid subroutine will wait for. It is formed by OR'ing

together one or more of the following flags:

WEXITED

Wait for processes that have exited.

WSTOPPED

Status will be returned for any child that has stopped upon receipt of a signal.

WCONTINUED

Status will be returned for any child that was stopped and has been continued.

WNOHANG

Return immediately if there are no children to wait for.

WNOWAIT

Keep the process whose status is returned in the *infop* parameter in a waitable state. This will not affect the state of the process. The process can be waited for

again after this call completes.

Return Values

If WNOHANG was specified and there are no children to wait for, 0 is returned. If the waitid subroutine returns due to the change of state of one of its children, 0 is returned. Otherwise, -1 is returned and errno is set to indicate the error.

Error Codes

EINVAL

The waitid subroutine will fail if:

ECHILD The calling process has no existing unwaited-for child

processes.

EINTR The waitid subroutine was interrupted by a signal.

> An invalid value was specified for the options, or idtype parameters and the id parameter specifies an invalid set

of processes.

wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine

Purpose

Performs operations on wide-character strings.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
wchar t * wcscat(WcString1, WcString2)
wchar t * WcString1;
const wchar_t * WcString2;
wchar t * wcschr(WcString, WideCharacter)
const wchar t *WcString;
wchar t WideCharacter;
int * wcscmp (WcString1, WcString2)
const wchar_t *WcString1, *WcString2;
wchar t * wcscpy(WcString1, WcString2)
wchar t *WcString1;
const wchar t
WcString2;
size t wcscspn(WcString1, WcString2)
const wchar t *WcString1, *WcString2;
```

Description

The wcscat, wcschr, wcscmp, wcscpy, or wcscspn subroutine operates on null-terminated wchar_t strings. These subroutines expect the string arguments to contain a wchar t null character marking the end of the string. A copy or concatenation operation does not perform boundary checking.

The wcscat subroutine appends a copy of the wide-character string pointed to by the WcString2 parameter (including the terminating null wide-character code) to the end of the wide-character string pointed to by the WcString1 parameter. The initial wide-character code of the WcString2 parameter overwrites the null wide-character code at the end of the WcString1 parameter. If successful, the wcscat subroutine returns the *WcString1* parameter.

The wcschr subroutine returns a pointer to the first occurrence of the WideCharacter parameter in the WcString parameter. The character value may be a wchar_t null character. The wchar_t null character at the end of the string is included in the search. The wcschr subroutine returns a pointer to the wide character code, if found, or returns a null pointer if the wide character is not found.

The wcscmp subroutine compares two wchar t strings. It returns an integer greater than 0 if the WcString1 parameter is greater than the WcString2 parameter. It returns 0 if the two strings are equivalent. It returns a number less than 0 if the WcString1 parameter is less than the WcString2 parameter. The sign of the difference in value between the first pair of wide-character codes that differ in the objects being compared determines the sign of a nonzero return value.

The wcscpy subroutine copies the contents of the WcString2 parameter (including the ending wchar_t null character) into the WcString1 parameter. If successful, the wcscpy subroutine returns the WcString1 parameter. If the wcscpy subroutine copies between overlapping objects, the result is undefined.

The wcscspn subroutine computes the number of wchar_t characters in the initial segment of the string pointed to by the WcString1 parameter that do not appear in the string pointed to by the WcString2 parameter. If successful, the wcscspn subroutine returns the number of wchar_t characters in the segment.

Parameters

WcString1 Points to a wide-character string. WcString2 Points to a wide-character string. WideCharacter Specifies a wide character for location.

Return Values

Upon successful completion, the wcscat and wcscpy subroutines return a value of ws1. The wcschr subroutine returns a pointer to the wide character code. Otherwise, a null pointer is returned.

The wcscmp subroutine returns an integer greater than, equal to, or less than 0, if the wide character string pointed to by the WcString1 parameter is greater than, equal to, or less than the wide character string pointed to by the *WcString2* parameter.

The wcscspn subroutine returns the length of the segment.

wcscoll Subroutine

Purpose

Compares wide character strings.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
int wcscoll ( WcString1, WcString2)
const wchar t *WcString1, *WcString2;
```

Description

The wcscoll subroutine compares the two wide-character strings pointed to by the WcString1 and WcString2 parameters based on the collation values specified by the LC COLLATE environment variable of the current locale.

Note: The wcscoll subroutine differs from the wcscmp subroutine in that the wcscoll subroutine compares wide characters based on their collation values, while the wcscmp subroutine compares wide characters based on their ordinal values. The wcscoll subroutine uses more time than the wcscmp subroutine because it obtains the collation values from the current locale.

The wcscoll subroutine may be unsuccessful if the wide character strings specified by the WcString1 or WcString2 parameter contains characters outside the domain of the current collating sequence.

Parameters

WcString1 Points to a wide-character string. WcString2 Points to a wide-character string.

Return Values

The wcscoll subroutine returns the following values:

- The collation value of the WcString1 parameter is less than that of the WcString2 parameter. < 0
- =0 The collation value of the WcString1 parameter is equal to that of the WcString2 parameter.
- >0 The collation value of the WcString1 parameter is greater than that of the WcString2 parameter.

The wcscoll subroutine indicates error conditions by setting the errno global variable. However, there is no return value to indicate an error. To check for errors, the errno global variable should be set to 0, then checked upon return from the wcscoll subroutine. If the errno global variable is nonzero, an error occurred.

Error Codes

EINVAL The WcString1 or WcString2 arguments contain wide-character codes outside the domain of the collating sequence.

wcsftime Subroutine

Purpose

Converts date and time into a wide character string.

Library

Standard C Library (libc. a)

Syntax

```
#include <time.h>
size t wcsftime (WcString, Maxsize, Format, TimPtr)
wchar t * WcString;
size t Maxsize;
const wchar_t * Format;
const struct tm * TimPtr;
```

Description

The wcsftime function is equivalent to the strftime function, except that:

- The argument wcs points to the initial element of an array of wide-characters into which the generated output is to be placed.
- The argument maxsize indicates the maximum number of wide-characters to be placed in the output
- The argument format is a wide-character string and the conversion specifications are replaced by corresponding sequences of wide-characters.
- · The return value indicates the number of wide-characters placed in the output array.

If copying takes place between objects that overlap, the behavior is undefined.

Parameters

WcString Contains the output of the wcsftime subroutine.

Maxsize Specifies the maximum number of bytes (including the wide character null-terminating byte) that may

be placed in the WcString parameter.

Format Specifiers are the same as in **strftime** ("strftime Subroutine" on page 340) function.

TimPtr Contains the data to be converted by the wcsftime subroutine.

Return Values

If successful, and if the number of resulting wide characters (including the wide character null-terminating byte) is no more than the number of bytes specified by the Maxsize parameter, the wcsftime subroutine returns the number of wide characters (not including the wide character null-terminating byte) placed in the WcString parameter. Otherwise, 0 is returned and the contents of the WcString parameter are indeterminate.

wcsid Subroutine

Purpose

Returns the charsetID of a wide character.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h>

int wcsid (WC) const wchar_t WC;

Description

The wcsid subroutine returns the charsetID of the wchar_t character. No validation of the character is performed. The parameter must point to a value in the character range of the current code set defined in the current locale.

Parameters

WC Specifies the character to be tested.

Return Values

Successful completion returns an integer value representing the charsetID of the character. This integer can be a number from 0 through n, where n is the maximum character set defined in the CHARSETID field of the charmap. See "Understanding the Character Set Description (charmap) Source File" in AIX 5L Version 5.3 National Language Support Guide and Reference for more information.

wcslen Subroutine

Purpose

Determines the number of characters in a wide-character string.

Library

Standard C Library (libc.a)

Syntax

```
#include <wcstr.h>
```

```
size_t wcslen( WcString)
const wchar_t *WcString;
```

Description

The wcslen subroutine computes the number of wchar_t characters in the string pointed to by the WcString parameter.

Parameters

WcString

Specifies a wide-character string.

Return Values

The wcslen subroutine returns the number of wchar t characters that precede the terminating wchar t null character.

Related Information

The **mbslen** subroutine, **wctomb** ("wctomb Subroutine" on page 544) subroutine.

wcsncat, wcsncmp, or wcsncpy Subroutine

Purpose

Performs operations on a specified number of wide characters from one string to another.

Library

Standard C Library (libc.a)

Syntax

```
#include <wcstr.h>
wchar_t * wcsncat (WcString1, WcString2, Number)
wchar_t * WcString1;
const wchar_t * WcString2;
size_t Number;
wchar_t * wcsncmp (WcString1, WcString2, Number)
const wchar t *WcString1, *WcString2;
size t Number;
```

```
wchar_t * wcsncpy (WcString1, WcString2, Number)
wchar t *WcString1;
const wchar_t *WcString2;
size t Number;
```

Description

The wcsncat, wcsncmp and wcsncpy subroutines operate on null-terminated wide character strings.

The wcsncat subroutine appends characters from the WcString2 parameter, up to the value of the Number parameter, to the end of the WcString1 parameter. It appends a wchar_t null character to the result and returns the WcString1 value.

The wcsncmp subroutine compares wide characters in the WcString1 parameter, up to the value of the Number parameter, to the WcString2 parameter. It returns an integer greater than 0 if the value of the WcString1 parameter is greater than the value of the WcString2 parameter. It returns a 0 if the strings are equivalent. It returns an integer less than 0 if the value of the WcString1 parameter is less than the value of the *WcString2* parameter.

The wcsncpy subroutine copies wide characters from the WcString2 parameter, up to the value of the Number parameter, to the WcString1 parameter. It returns the value of the WcString1 parameter. If the number of characters in the WcString2 parameter is less than the Number parameter, the WcString1 parameter is padded out with wchar t null characters to a number equal to the value of the Number parameter.

Parameters

Specifies a wide-character string. WcString1 WcStrina2 Specifies a wide-character string.

Number Specifies the range of characters to process.

wcspbrk Subroutine

Purpose

Locates the first occurrence of characters in a string.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
wchar t *wcspbrk( WcString1, WcString2)
const wchar t *WcString1;
const wchar_t *WcString2;
```

Description

The wcspbrk subroutine locates the first occurrence in the wide character string pointed to by the WcString1 parameter of any wide character from the string pointed to by the WcString2 parameter.

Parameters

WcString1 Points to a wide-character string being searched.

WcString2 Points to a wide-character string.

Return Values

If no wchar_t character from the WcString2 parameter occurs in the WcString1 parameter, the wcspbrk subroutine returns a pointer to the wide character, or a null value.

Related Information

The mbspbrk subroutine, wcschr ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcscspn ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcsrchr ("wcsrchr Subroutine") subroutine, wcsspn ("wcsspn Subroutine" on page 527) subroutine, wcstok ("wcstok Subroutine" on page 533) subroutine, wcswcs ("wcswcs Subroutine" on page 540) subroutine.

wcsrchr Subroutine

Purpose

Locates a wchar_t character in a wide-character string.

Library

Standard C Library (libc.a)

Syntax

```
#include <wcstr.h>
wchar t *wcsrchr ( WcString, WideCharacter)
const wchar t *WcString;
wint_t WideCharacter;
```

Description

The wcsrchr subroutine locates the last occurrence of the WideCharacter value in the string pointed to by the WcString parameter. The terminating wchar_t null character is considered to be part of the string.

Parameters

WcStrina Points to a string.

WideCharacter Specifies a wchar_t character.

Return Values

The wcsrchr subroutine returns a pointer to the WideCharacter parameter value, or a null pointer if that value does not occur in the specified string.

Related Information

The **mbschr** subroutine, **mbsrchr** subroutine, **wcschr** ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcscspn ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcspbrk ("wcspbrk Subroutine" on page 524) subroutine, wcsppn ("wcsspn Subroutine" on page 527) subroutine, wcstok ("wcstok Subroutine" on page 533) subroutine, wcswcs ("wcswcs Subroutine" on page 540) subroutine.

National Language Support Overview and Understanding Wide Character String Search Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

wcsrtombs Subroutine

Purpose

Convert a wide-character string to a character string (restartable).

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
size t wcsrtombs (char * dst, const wchar t ** src, size t len, mbstate t * ps);
```

Description

The wcsrtombs function converts a sequence of wide-characters from the array indirectly pointed to by src into a sequence of corresponding characters, beginning in the conversion state described by the object pointed to by ps.lf dst is not a null pointer, the converted characters are then stored into the array pointed to by dst. Conversion continues up to and including a terminating null wide-character, which is also stored. Conversion stops earlier in the following cases:

- When a code is reached that does not correspond to a valid character.
- When the next character would exceed the limit of len total bytes to be stored in the array pointed to by **dst** (and **dst** is not a null pointer).

Each conversion takes place as if by a call to the **wcrtomb** function.

If dst is not a null pointer, the pointer object pointed to by src is assigned either a null pointer (if conversion stopped due to reaching a terminating null wide-character) or the address just past the last wide-character converted (if any). If conversion stopped due to reaching a terminating null wide-character, the resulting state described is the initial conversion state.

If ps is a null pointer, the wcsrtombs function uses its own internal mbstate t object, which is initialised at program startup to the initial conversion state. Otherwise, the **mbstate_t** object pointed to by **ps** is used to completely describe the current conversion state of the associated character sequence. The implementation will behave as if no function defined in this specification calls wcsrtombs.

The behavior of this function is affected by the LC_CTYPE category of the current locale.

Return Values

If conversion stops because a code is reached that does not correspond to a valid character, an encoding error occurs. In this case, the wcsrtombs function stores the value of the macro EILSEQ in errno and returns (size t)-1; the conversion state is undefined. Otherwise, it returns the number of bytes in the resulting character sequence, not including the terminating null (if any).

Error Codes

The wcsrtombs function may fail if:

EINVAL **ps** points to an object that contains an invalid conversion state. **EILSEQ** A wide-character code does not correspond to a valid character.

Related Information

The wctomb ("wctomb Subroutine" on page 544) subroutine.

wcsspn Subroutine

Purpose

Returns the number of wide characters in the initial segment of a string.

Library

Standard C Library (libc.a)

Syntax

#include <wcstr.h>

size_t wcsspn(WcString1, WcString2) const wchar_t *WcString1, *WcString2;

Description

The wcsspn subroutine computes the number of wchar t characters in the initial segment of the string pointed to by the WcString1 parameter. The WcString1 parameter consists entirely of wchar t characters from the string pointed to by the WcString2 parameter.

Parameters

WcString1 Points to the initial segment of a string. WcString2 Points to a set of characters string.

Return Values

The wcsspn subroutine returns the number of wchar_t characters in the segment.

Related Information

The wcschr ("wcscat, wcschr, wcscpp, wcscpp, or wcscspn Subroutine" on page 518) subroutine, wcscspn ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcspbrk ("wcspbrk Subroutine" on page 524) subroutine, wcsrchr ("wcsrchr Subroutine" on page 525) subroutine, wcstok ("wcstok Subroutine" on page 533) subroutine, wcswcs ("wcswcs Subroutine" on page 540) subroutine.

National Language Support Overview and Wide Character String Search Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

wcsstr Subroutine

Purpose

Find a wide-character substring.

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
wchar_t *wcsstr (const wchar_t * ws1, const wchar_t * ws2);
```

Description

The wcsstr function locates the first occurrence in the wide-character string pointed to by ws1 of the sequence of wide-characters (excluding the terminating null wide-character) in the wide- character string pointed to by ws2.

Return Values

On successful completion, wcsstr returns a pointer to the located wide-character string, or a null pointer if the wide-character string is not found.

If ws2 points to a wide-character string with zero length, the function returns ws1.

wcstod, wcstof, or wcstold Subroutine

Purpose

Converts a wide character string to a double-precision number.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h> #include <wchar.h>

```
double wcstod ( nptr, endptr)
const wchar_t *nptr;
wchar_t **endptr;
float wcstof (nptr, endptr)
const wchar t *restrict nptr;
wchar_t **restrict endptr;
long double wcstold (nptr, endptr)
const wchar t *restrict format;
wchar t **restrict nptr;
```

Description

The wcstod, wcstof, and wcstold subroutines convert the initial portion of the wide-character string pointed to by *nptr* to **double**, **float** and **long double** representation, respectively. First, they decompose the input wide-character string into three parts:

- · An initial, possibly empty, sequence of white-space wide-character codes.
- A subject sequence interpreted as a floating-point constant or representing infinity or NaN.
- · A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string.

Then they convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign, and one of the following:

- · A non-empty sequence of decimal digits optionally containing a radix character, and an optional exponent part.
- · A 0x or 0X, and a non-empty sequence of hexadecimal digits optionally containing a radix character, and an optional binary exponent part.
- · One of INF or INFINITY, or any other wide string equivalent except for case.
- One of NAN or NAN(n-wchar-sequence opt), or any other wide string ignoring case in the NAN part, where:

```
n-wchar-sequence:
  digit
  nondigit
  n-wchar-sequence digit
  n-wchar-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input wide string, starting with the first non-white-space wide character, that is of the expected form. The subject sequence contains no wide characters if the input wide string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of wide characters starting with the first digit or the radix character (whichever occurs first) are interpreted as a floating constant according to the rules of the C language, except that the radix character is used in place of a period. If neither an exponent part or a radix character appears in a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string.

If the subject sequence begins with a minus sign, the sequence is interpreted as negated. A wide-character sequence INF or INFINITY is interpreted as an infinity, if representable in the return type, or else as if it were a floating constant that is too large for the range of the return type. A wide-character sequence NAN or NAN(*n-wchar-sequence* opt) is interpreted as a quiet NaN, if supported in the return type, or else as if it were a subject sequence part that does not have the expected form. The meaning of the n-wchar sequences is implementation-defined. A pointer to the final wide string is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the conversion will be rounded in an implementation-defined manner.

The radix character is as defined in the program's locale (category LC_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the radix character defaults to a period.

In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion is performed. The value of *nptr* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

The wcstod, wcstof, and wcstold subroutines do not change the setting of the errno global variable if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set errno to 0, call wcstod, wcstof, or wcstold, and check errno.

Parameters

Contains a pointer to the wide character string to be converted to a double-precision value. nntr

Contains a pointer to the position in the string specified by the nptr parameter where a wide character is endptr

found that is not a valid character for the purpose of this conversion.

Return Values

Upon successful completion, the wcstod, wcstof, and wcstold subroutines return the converted value. If no conversion could be performed, 0 is returned and the errno global variable may be set to EINVAL.

If the correct value is outside the range of representable values, plus or minus HUGE_VAL, HUGE_VALF, or **HUGE VALL** is returned (according to the sign of the value), and **errno** is set to ERANGE.

If the correct value would cause underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type is returned and errno set to ERANGE.

ctype, isalpha, isupper, islower, isdigit, isxdigit, isalnum, isspace, ispunct, isprint, isgraph, iscntrl, or isascii Subroutines and localeconv Subroutine in AIX 5L Version 5.3 Technical Reference: Base Operating System and Extensions Volume 1.

wcstod32, wcstod64, or wcstod128 Subroutine

Purpose

Converts a wide character string to a decimal floating-point number.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
#include <wchar.h>
Decimal32 wcstod32 (nptr, endptr)
const wchar t *nptr;
wchar_t **endptr;
Decimal64 wcstod64 (nptr, endptr)
const wchar t *nptr;
wchar_t **endptr;
Decimal128 wcstod128 (nptr, endptr)
const wchar_t *nptr;
wchar_t **endptr;
```

Description

The wcstod32, wcstod64, and wcstod128 subroutines convert the initial portion of the wide-character string pointed to by the *nptr* parameter to _Decimal32, _Decimal64, and _Decimal128 representation, respectively. First, these subroutines decompose the input wide-character string into three parts:

- · An initial and possibly empty sequence of white-space and wide-character codes
- A subject sequence interpreted as a floating-point constant or representing infinity or NaN
- A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string

Then, wcstod32, wcstod64, and wcstod128 subroutines attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign and one of the following:

- · A non-empty sequence of decimal digits optionally containing a radix character and an optional exponent part
- One of INF or INFINITY, or any other wide string equivalent except for case
- One of NAN or NAN (*n-wchar-sequence* opt), ignoring case in the NAN, where:

```
n-wchar-sequence:
               digit
               n-wchar-sequence digit
```

The subject sequence is defined as the longest initial subsequence of the input wide string, starting with the first non-white-space wide character that is of the expected form. The subject sequence contains no wide characters if the input wide string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of wide characters starting with the first digit or the radix character (whichever occurs first) are interpreted as a floating constant according to the rules of the C language, except that it is not a hexadecimal floating number, or that the radix character is used in place of a period. If neither an exponent part nor a radix character appears in a decimal floating-point number, an exponent part of the appropriate type with value 0 is assumed to follow the last digit in the string.

If the subject sequence begins with a minus sign, the sequence is interpreted as negated. A wide-character sequence INF or INFINITY is interpreted as infinity. A wide-character sequence NAN or NAN(*n-wchar-sequence* oot) is interpreted as a quiet NaN. The meaning of the *n*-wchar sequences is implementation-defined. A pointer to the final wide string is stored in the object pointed to by the endptr parameter, provided that the *endptr* parameter is not a null pointer.

The radix character is as defined in the locale of the program (category LC NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the radix character defaults to a period.

In locales other than the C or POSIX locale, other implementation-defined subject sequences can be accepted.

If the subject sequence is empty or does not have the expected form, no conversion is performed. The value of the *nptr* parameter is stored in the object pointed to by the *endptr* parameter, provided that the endptr parameter is not a null pointer.

The wcstod32, wcstod64, and wcstod128 subroutines do not change the setting of the errno global variable if successful.

The value of 0 is returned on error and is also a valid return on success. Therefore, an application wishing to check for error situations should set the errno global variable to the value of 0, call the wcstod32. wcstod64, or wcstod128 subroutine, and check the errno global variable.

Parameters

nptr Contains a pointer to the string to be converted to a decimal floating point value.

endpr Contains a pointer to the position in the string specified by the nptr parameter where a wide

character is found that is not a valid character for the conversion.

Return Values

Upon successful completion, the wcstod32, wcstod64, and wcstod128 subroutines return the converted value. If no conversion can be performed, the value of 0 is returned and the errno global variable might be set to EINVAL.

If the correct value is outside the range of representable values, ±HUGE_VAL_D32, ±HUGE_VAL_D64, or **±HUGE VAL D128** is returned (according to the return type and sign of the value), and the **errno** global variable is set to ERANGE.

If the correct value causes underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type is returned, and the errno global variable is set to ERANGE.

wcstoimax or wcstoumax Subroutine

Purpose

Converts a wide-character string to an integer type.

Syntax

```
#include <stddef.h>
#include <inttypes.h>
intmax t wcstoimax (nptr, endptr, base)
const wchar t *restrict nptr;
wchar_t **restrict endptr;
int base;
```

```
uintmax t wcstoumax (nptr, endptr, base)
const wchar t *restrict nptr;
wchar_t **restrict endptr;
int base:
```

Description

The wcstoimax or wcstoumax subroutines are equivalent to the wcstol, wcstoll, wcstoul, and wcstoull subroutines, respectively, except that the initial portion of the wide string is converted to intmax t and uintmax t representation, respectively.

Parameters

Points to the wide-character string. nptr

Points to the object where the final wide-character string is stored. endptr base Determines the subject sequence interpreted as an integer.

Return Values

The wcstoimax or wcstoumax subroutines return the converted value, if any.

If no conversion could be performed, zero is returned. If the correct value is outside the range of representable values, {INTMAX_MAX}, {INTMAX_MIN}, or {UINTMAX_MAX} is returned (according to the return type and sign of the value, if any), and the errno global variable is set to ERANGE.

inttypes.h in AIX 5L Version 5.3 Files Reference.

wcstok Subroutine

Purpose

Converts wide-character strings to tokens.

Library

Standard C Library (libc.a)

Syntax

```
#include <wchar.h>
wchar_t *wcstok ( WcString1, WcString2, ptr)
wchar_t *WcString1;
const wchar t *WcString2;
wchar t **ptr
```

Description

A sequence of calls to the wcstok subroutine breaks the wide-character string pointed to by WcString1 into a sequence of tokens, each of which is delimited by a wide-character code from the wide-character string pointed to by WcString2. The third argument points to a caller-provided wchar t pointer where wcstok stores information necessary for it to continue scanning the same wide-character string.

The first call in the sequence has WcString1 as its first argument and is followed by calls with a nullpointer as their first argument. The separator string pointed to by WcString2 may be different from call to call.

The first call in the sequence searches the wide-character string pointed to by WcString1 for the first wide-character code that is not contained in the current separator string pointed to by WcString2. If no such wide-character code is found, then there are no tokens in the wide-character string pointed to by WcString1 and wcstok returns a null pointer. If such a wide-character code is found, it is the start of the first token.

The wcstok subroutine then searches from there for a wide-character code that is contained in the current separator string. If no such wide-character code is found, the current token extends to the end of the wide-character string pointed to by WcString1, and subsequent searches for a token returns a null pointer. If such a wide-character code is found, it is overwritten by a null wide-character, which terminates the current token. The wcstok subroutine saves a pointer to the following wide-character code, from which the next search for a token starts.

Each subsequent call, with a null pointer as the value of the first argument, starts searching from the saved pointer and behaves as described above.

The implementation behaves as if no function calls wcstok.

Parameters

ptr Contains a pointer to a caller-provided wchar_t pointer where wcstok stores information necessary

for it to continue scanning the same wide-character string.

WcString1 Contains a pointer to the wide-character string to be searched. WcString2 Contains a pointer to the string of wide-character token delimiters.

Return Values

Upon successful completion, wcstok returns a pointer to the first wide-character code of a token. Otherwise, if there is no token, wcstok returns a null pointer.

Examples

To convert a wide-character string to tokens, use the following:

```
#include <wchar.h>
#include <locale.h>
#include <stdlib.h>
main()
        wchar t WCString1[] = L"?a???b,,,#c";
        wchar t *ptr;
        wchar t *pwcs;
        (void)setlocale(LC ALL, "");
        pwcs = wcstok(WCString1, L"?", &ptr);
                /* pwcs points to the token L"a"*/
        pwcs = wcstok((wchar_t *)NULL, L",", &ptr);
               /* pwcs points to the token L"??b"*/
        pwcs = wcstok( (wchar t *)NULL, L"#,", &ptr);
                /* pwcs points to the token L"c"*/
```

National Language Support Overview for Programming and Wide Character String Search Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

wcstol or wcstoll Subroutine

Purpose

Converts a wide-character string to a long integer representation.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
long int wcstol ( Nptr, Endptr, Base)
const wchar_t *Nptr;
wchar_t **Endptr;
int Base;
long long int wcstoll (*Nptr, **Endptr, Base)
const wchar_t *Nptr;
wchar_t **Endptr:
int Base
```

Description

The **wcstol** subroutine converts a wide-character string to a long integer representation. The **wcstoll** subroutine converts a wide-character string to a long long integer representation.

- 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by the **iswspace** subroutine)
- 2. A subject sequence interpreted as an integer and represented in a radix determined by the *Base* parameter
- 3. A final wide-character string of one or more unrecognized wide-character codes, including the terminating wide-character null of the input wide-character string

If possible, the subject is then converted to an integer, and the result is returned.

The *Base* parameter can take the following values: 0 through 9, or a (or A) through z (or Z). There are potentially 36 values for the base. If the base value is 0, the expected form of the subject string is that of a decimal, octal, or hexadecimal constant, any of which can be preceded by a + (plus sign) or - (minus sign). A decimal constant starts with a non zero digit, and is composed of a sequence of decimal digits. An octal constant consists of the prefix 0 optionally followed by a sequence of the digits 0 to 7. A hexadecimal

constant is defined as the prefix 0x (or 0X) followed by a sequence of decimal digits and the letters a (or A) to f (or F) with values ranging from 10 (for a or A) to 15 (for f or F).

If the base value is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer in the radix specified by the Base parameter, optionally preceded by a + or -, but not including an integer suffix. The letters a (or A) through z (or Z) are ascribed the values of 10 to 35. Only letters whose values are less than that of the base are permitted. If the value of base is 16, the characters 0x or 0X may optionally precede the sequence of letters or digits, following the sign, if present.

The wide-character string is parsed to skip the initial space characters (as determined by the iswspace subroutine). Any non-space character signifies the start of a subject string that may form an integer in the radix specified by the Base parameter. The subject sequence is defined to be the longest initial substring that is a long integer of the expected form. Any character not satisfying this form begins the final portion of the wide-character string pointed to by the Endptr parameter on return from the call to the westol or wcstoll subroutine.

Parameters

Nptr Contains a pointer to the wide-character string to be converted to a long integer number.

Endptr Contains a pointer to the position in the Nptr parameter string where a wide-character is found that is not

a valid character.

Specifies the radix in which the characters are interpreted. Base

Return Values

The westol and westoll subroutines return the converted value of the long or long long integer if the expected form is found. If no conversion could be performed, a value of 0 is returned. If the converted value is outside the range of representable values, LONG MAX or LONG MIN is returned for the wcstol subroutine and LLONG MAX or LLONG MIN is returned for the wcstoll subroutine (according to the sign of the value). The value of errno is set to ERANGE. If the base value specified by the Base parameter is not supported, EINVAL is returned.

If the subject sequence has the expected form, it is interpreted as an integer constant in the appropriate base. A pointer to the final string is stored in the Endptr parameter if that parameter is not a null pointer.

If the subject sequence is empty or does not have a valid form, no conversion is done. The value of the Nptr parameter is stored in the Endptr parameter if that parameter is not a null pointer.

Since 0, LONG_MIN, and LONG_MAX (for wcstol) and LLONG_MIN, and LLONG_MAX (for wcstoll) are returned in the event of an error and are also valid returns if the wcstol or wcstoll subroutine is successful, applications should set the errno global variable to 0 before calling either subroutine, and check errno after return. If the errno global value has changed, an error occurred.

Examples

To convert a wide-character string to a signed long integer, use the following code:

```
#include <stdlib.h>
#include <locale.h>
#include <errno.h>
main()
{
        wchar t *WCString, *endptr;
        long int retval;
        (void)setlocale(LC ALL, "");
        /**Set errno to 0 so a failure for westol can be
        **detected */
```

```
errno=0:
**Let WCString point to a wide character null terminated
** string containing a signed long integer value
        */retval = wcstol ( WCString &endptr, 0 );
/* Check errno, if it is non-zero, wcstol failed */
if (errno != 0) {
       /*Error handling*/
else if (&WCString == endptr) {
        /* No conversion could be performed */
       /* Handle this case accordingly. */
/* retval contains long integer */
```

The **iswspace** subroutine, **wcstod** ("wcstod, wcstof, or wcstold Subroutine" on page 528) subroutine, wcstoul ("wcstoul or wcstoull Subroutine" on page 538) subroutine.

National Language Support Overview and Wide Character String Conversion Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

wcstombs Subroutine

Purpose

Converts a sequence of wide characters into a sequence of multibyte characters.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
size t wcstombs ( String, WcString, Number)
char *String;
const wchar_t *WcString;
size_t Number;
```

Description

The wcstombs subroutine converts the sequence of wide characters pointed to by the WcString parameter to a sequence of corresponding multibyte characters and places the results in the area pointed to by the String parameter. The conversion is terminated when the null wide character is encountered or when the number of bytes specified by the Number parameter (or the value of the Number parameter minus 1) has been placed in the area pointed to by the String parameter. If the amount of space available in the area pointed to by the String parameter would cause a partial multibyte character to be stored, the subroutine uses a number of bytes equalling the value of the Number parameter minus 1, because only complete multibyte characters are allowed.

Parameters

String Points to the area where the result of the conversion is stored. If the String parameter is a null

pointer, the subroutine returns the number of bytes required to hold the conversion.

WcString Points to a wide-character string.

Specifies a number of bytes to be converted. Number

Return Values

The wcstombs subroutine returns the number of bytes modified. If a wide character is encountered that is not valid, a value of -1 is returned.

Error Codes

The **wcstombs** subroutine is unsuccessful if the following error occurs:

EILSEQ An invalid character sequence is detected, or a wide-character code does not correspond to a valid

character.

Related Information

The **mbstowcs** subroutine, **mbtowc** subroutine, **wcslen** ("wcslen Subroutine" on page 522) subroutine, wctomb ("wctomb Subroutine" on page 544) subroutine.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

National Language Support Overview and Multibyte Code and Wide Character Code Conversion Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

wcstoul or wcstoull Subroutine

Purpose

Converts wide character strings to unsigned long or long long integer representation.

Library

Standard C Library (libc.a)

Syntax

```
#include <stdlib.h>
unsigned long int wcstoul (Nptr, Endptr, Base)
const wchar t * Nptr;
wchar_t ** Endptr;
int Base;
unsigned long long int wcstoull (Nptr, Endptr, Base)
const wchar t *Nptr;
wchar_t **Endptr;
int Base;
```

Description

The westoul and westoull subroutines convert the initial portion of the wide character string pointed to by the Nptr parameter to an unsigned long or long long integer representation. To do this, it parses the wide character string pointed to by the Nptr parameter to obtain a valid string (that is, subject string) for the

purpose of conversion to an unsigned long integer. It then points the *Endptr* parameter to the position where an unrecognized character, including the terminating null, is found.

The base specified by the Base parameter can take the following values: 0 through 9, a (or A) through z (or Z). There are potentially 36 values for the base. If the base value is 0, the expected form of the subject string is that of an unsigned integer constant, with an optional + (plus sign) or - (minus sign), but not including the integer suffix. If the base value is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by the Base parameter, optionally preceded by a + or -, but not including an integer suffix.

The letters a (or A) through z (or Z) are ascribed the values of 10 to 35. Only letters whose values are less than that of the base are permitted. If the value of the base is 16, the characters 0x (or 0X) may optionally precede the sequence of letters or digits, following a + or - . present.

The wide character string is parsed to skip the initial white-space characters (as determined by the iswspace subroutine). Any nonspace character signifies the start of a subject string that may form an unsigned long integer in the radix specified by the Base parameter. The subject sequence is defined to be the longest initial substring that is an unsigned long integer of the expected form. Any character not satisfying this expected form begins the final portion of the wide character string pointed to by the Endptr parameter on return from the call to this subroutine.

Parameters

Nptr Contains a pointer to the wide character string to be converted to an unsigned long integer.

Contains a pointer to the position in the Nptr string where a wide character is found that is not a valid Endptr

character for the purpose of this conversion.

Base Specifies the radix in which the wide characters are interpreted.

Return Values

The wcstoul and wcstoull subroutines return the converted value of the unsigned long or long long integer if the expected form is found. If no conversion could be performed, a value of 0 is returned. If the converted value is outside the range of representable values, a ULONG MAX value is returned (for wcstoul), and ULLONG MAX is returned (for wcstoull), and the value of the errno global variable is set to a **ERANGE** value.

If the subject sequence has the expected form, it is interpreted as an integer constant in the appropriate base. A pointer to the final string is stored in the Endptr parameter if that parameter is not a null pointer. If the subject sequence is empty or does not have a valid form, no conversion is done and the value of the *Nptr* parameter is stored in the *Endptr* parameter if it is not a null pointer.

If the radix specified by the Base parameter is not supported, an EINVAL value is returned. If the value to be returned is not representable, an **ERANGE** value is returned.

Examples

To convert a wide character string to an unsigned long integer, use the following code:

```
#include <stdlib.h>
#include <locale.h>
#include <errno.h>
extern int errno;
main()
        wchar t *WCString, *EndPtr;
       unsigned long int retval;
```

```
(void)setlocale(LC ALL, "");
        ** Let WCString point to a wide character null terminated
        ** string containing an unsigned long integer value.
        */
        retval = wcstoul ( WCString &EndPtr, 0 );
        if(retval==0) {
                /* No conversion could be performed */
                /* Handle this case accordingly. */
        } else if(retval == ULONG MAX) {
                /* Error handling */
        /* retval contains the unsigned long integer value. */
}
```

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs

wcswcs Subroutine

Purpose

Locates first occurrence of a wide character in a string.

Library

Standard C Library (libc.a)

Syntax

#include <string.h>

```
wchar_t *wcswcs( WcString1, WcString2)
const wchar_t *WcString1, *WcString2;
```

Description

The **wcswcs** subroutine locates the first occurrence, in the string pointed to by the *WcString1* parameter, of a sequence of wchar_t characters (excluding the terminating wchar_t null character) from the string pointed to by the WcString2 parameter.

Parameters

WcString1 Points to the wide-character string being searched. WcString2 Points to a wide-character string, which is a source string.

Return Values

The wcswcs subroutine returns a pointer to the located string, or a null value if the string is not found. If the WcString2 parameter points to a string with 0 length, the function returns the WcString1 value.

The **mbspbrk** subroutine, **wcschr** ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcscspn ("wcscat, wcschr, wcscmp, wcscpy, or wcscspn Subroutine" on page 518) subroutine, wcspbrk ("wcspbrk Subroutine" on page 524) subroutine, wcsrchr ("wcsrchr Subroutine" on page 525) subroutine, wcsspn ("wcsspn Subroutine" on page 527) subroutine, wcstok ("wcstok Subroutine" on page 533) subroutine.

National Language Support Overview and Wide Character String Search Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs

wcswidth Subroutine

Purpose

Determines the display width of wide character strings.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
int wcswidth (* Pwcs, n)
const wchar t *Pwcs;
size_t n;
```

Description

The wcswidth subroutine determines the number of display columns to be occupied by the number of wide characters specified by the N parameter in the string pointed to by the Pwcs parameter. The LC CTYPE category affects the behavior of the wcswidth subroutine. Fewer than the number of wide characters specified by the N parameter are counted if a null character is encountered first.

Parameters

Specifies the maximum number of wide characters whose display width is to be determined.

Pwcs Contains a pointer to the wide character string.

Return Values

The wcswidth subroutine returns the number of display columns to be occupied by the number of wide characters (up to the terminating wide character null) specified by the N parameter (or fewer) in the string pointed to by the Pwcs parameter. A value of zero is returned if the Pwcs parameter is a wide character null pointer or a pointer to a wide character null (that is, Pwcs or *Pwcs is null). If the Pwcs parameter points to an unusable wide character code, -1 is returned.

Examples

To find the display column width of a wide character string, use the following:

```
#include <string.h>
#include <locale.h>
#include <stdlib.h>
```

```
main()
   wchar t *pwcs;
   int
          retval, n ;
   (void)setlocale(LC ALL, "");
   /* Let pwcs point to a wide character null terminated
   ** string. Let n be the number of wide characters whose
   ** display column width is to be determined.
   retval= wcswidth( pwcs, n );
   if(retval == -1){
           /* Error handling. Invalid wide character code
           ** encountered in the wide character string pwcs.
```

The wcwidth ("wcwidth Subroutine" on page 547) subroutine.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

wcsxfrm Subroutine

Purpose

Transforms wide-character strings to wide-character codes of current locale.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
size_t wcsxfrm ( WcString1, WcString2, Number)
wchar t *WcString1;
const wchar t *WcString2;
size_t Number;
```

Description

The wcsxfrm subroutine transforms the wide-character string specified by the WcString2 parameter into a string of wide-character codes, based on the collation values of the wide characters in the current locale as specified by the LC COLLATE category. No more than the number of character codes specified by the Number parameter are copied into the array specified by the WcString1 parameter. When two such transformed wide-character strings are compared using the wcscmp subroutine, the result is the same as that obtained by a direct call to the wcscoll subroutine on the two original wide-character strings.

Parameters

WcString1 Points to the destination wide-character string. WcString2 Points to the source wide-character string.

Number

Specifies the maximum number of wide-character codes to place into the array specified by WcString1. To determine the necessary size specification, set the Number parameter to a value of 0, so that the WcString1 parameter becomes a null pointer. The return value plus 1 is the size necessary for the conversion.

Return Values

If the WcString1 parameter is a wide-character null pointer, the wcsxfrm subroutine returns the number of wide-character elements (not including the wide-character null terminator) required to store the transformed wide character string. If the count specified by the Number parameter is sufficient to hold the transformed string in the WcString1 parameter, including the wide character null terminator, the return value is set to the actual number of wide character elements placed in the WcString1 parameter, not including the wide character null. If the return value is equal to or greater than the value specified by the *Number* parameter, the contents of the array pointed to by the *WcString1* parameter are indeterminate. This occurs whenever the Number value parameter is too small to hold the entire transformed string. If an error occurs, the wcsxfrm subroutine returns the size_t data type with a value of -1 and sets the errno global variable to indicate the error.

If the wide character string pointed to by the WcString2 parameter contains wide character codes outside the domain of the collating sequence defined by the current locale, the wcsxfrm subroutine returns a value of **EINVAL**.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

wctob Subroutine

Purpose

Wide-character to single-byte conversion.

Library

Standard library (libc.a)

Syntax

#include <stdio.h> #include <wchar.h> int wctob (wint t c);

Description

The wctob function determines whether c corresponds to a member of the extended character set whose character representation is a single byte when in the initial shift state.

The behavior of this function is affected by the LC_CTYPE category of the current locale.

Return Values

The wctob function returns EOF if c does not correspond to a character with length one in the initial shift state. Otherwise, it returns the single-byte representation of that character.

Related Information

The **btowc** subroutine.

wctomb Subroutine

Purpose

Converts a wide character into a multibyte character.

Library

Standard C Library (libc.a)

Syntax

#include <stdlib.h>

int wctomb (Storage, WideCharacter) char *Storage; wchar_t WideCharacter;

Description

The wctomb subroutine determines the number of bytes required to represent the wide character specified by the WideCharacter parameter as the corresponding multibyte character. It then converts the WideCharacter value to a multibyte character and stores the results in the area pointed to by the Storage parameter. The wctomb subroutine can store a maximum of MB_CUR_MAX bytes in the area pointed to by the Storage parameter. Thus, the length of the area pointed to by the Storage parameter should be at least MB CUR MAX bytes. The MB CUR MAX macro is defined in the stdlib.h file.

Parameters

Points to an area where the result of the conversion is stored. Storage

WideCharacter Specifies a wide-character value.

Return Values

The wctomb subroutine returns a 0 if the Storage parameter is a null pointer. If the WideCharacter parameter does not correspond to a valid multibyte character, a -1 is returned. Otherwise, the number of bytes that comprise the multibyte character is returned.

Related Information

The **mbtowc** subroutine, **mbstowcs** subroutine, **wcslen** ("wcslen Subroutine" on page 522) subroutine, wcstombs ("wcstombs Subroutine" on page 537) subroutine.

National Language Support Overview and Multibyte Code and Wide Character Code Conversion Subroutines in AIX 5L Version 5.3 National Language Support Guide and Reference.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

wctrans Subroutine

Purpose

Define character mapping.

Library

Standard library (libc.a)

Syntax

```
#include <wctype.h>
wctrans_t wctrans (const char * charclass);
```

Description

The wctrans function is defined for valid character mapping names identified in the current locale. The charclass is a string identifying a generic character mapping name for which codeset-specific information is required. The following character mapping names are defined in all locales "tolower" and "toupper".

The function returns a value of type wctrans_t, which can be used as the second argument to subsequent calls of towctrans. The wctrans function determines values of wctrans_t according to the rules of the coded character set defined by character mapping information in the program's locale (category LC CTYPE). The values returned by wctrans are valid until a call to setlocale that modifies the category LC CTYPE.

Return Values

The wctrans function returns 0 if the given character mapping name is not valid for the current locale (category LC CTYPE), otherwise it returns a non-zero object of type wctrans t that can be used in calls to towctrans.

Error Codes

The wctrans function may fail if:

EINVAL The character mapping name pointed to by charclass is not valid in the current locale.

Related Information

The **towctrans** ("towctrans Subroutine" on page 425) subroutine.

wctype or get_wctype Subroutine

Purpose

Obtains a handle for valid property names in the current locale for wide characters.

Library

Standard C library (libc.a).

Syntax

#include <wchar.h>

```
wctype_t wctype ( Property)
const char *Property;
wctype_t get_wctype ( Property)
char *Property;
```

Description

The **wctype** subroutine obtains a handle for valid property names for wide characters as defined in the current locale. The handle is of data type **wctype_t** and can be used as the *WC_PROP* parameter in the **iswctype** subroutine. Values returned by the **wctype** subroutine are valid until the **setlocale** subroutine modifies the **LC CTYPE** category. The **get wctype** subroutine is identical to the **wctype** subroutine.

The **wctype** subroutine adheres to X/Open Portability Guide Issue 5.

Parameters

Property

Points to a string that identifies a generic character class for which code set-specific information is required. The basic character classes are:

alnum Alphanumeric character.alpha Alphabetic character.

blank Space and tab characters.

cntrl Control character. No characters in alpha or print are included.

digit Numeric digit character.

graph Graphic character for printing. Does not include the space character or cntrl characters, but

does include all characters in digit and punct.

lower Lowercase character. No characters in cntrl, digit, punct, or space are included.

print Print character. Includes characters in **graph**, but does not include characters in **cntrl**.

punct Punctuation character. No characters in alpha, digit, or cntrl, or the space character are

included.

space Space characters.

upper Uppercase character.

xdigit Hexadecimal character.

Return Values

A value of type **wctype_t** (a handle for valid property names in the current locale)

Successful

Unsuccessful (The *Property* parameter specifies a character class that is not valid for the current locale.)

Related Information

The **iswalnum** subroutine, **iswalpha** subroutine, **iswcntrl** subroutine, **iswctype** subroutine, **iswdigit** subroutine, **iswgraph** subroutine, **iswlower** subroutine, **iswprint** subroutine, **iswpunct** subroutine, **iswspace** subrout

wcwidth Subroutine

Purpose

Determines the display width of wide characters.

Library

Standard C Library (libc.a)

Syntax

```
#include <string.h>
int wcwidth ( WC)
wchar_t WC;
```

Description

The wcwidth subroutine determines the number of display columns to be occupied by the wide character specified by the WC parameter. The LC CTYPE subroutine affects the behavior of the wcwidth subroutine.

Parameters

WC Specifies a wide character.

Return Values

The wcwidth subroutine returns the number of display columns to be occupied by the WC parameter. If the WC parameter is a wide character null, a value of 0 is returned. If the WC parameter points to an unusable wide character code, -1 is returned.

Examples

To find the display column width of a wide character, use the following:

```
#include <string.h>
#include <locale.h>
#include <stdlib.h>
main()
   wchar_t wc;
   int retval;
   (void)setlocale(LC ALL, "");
   /* Let wc be the wide character whose
   ** display width is to be found.
   retval= wcwidth( wc );
   if(retval == -1){
            /*
```

```
** Error handling. Invalid wide character in wc.
}
```

The wcswidth ("wcswidth Subroutine" on page 541) subroutine.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

wlm_assign Subroutine

Purpose

Manually assigns processes to a class or cancels prior manual assignments for processes.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
int wlm_assign ( args)
struct wlm_assign *args;
```

Description

The wlm assign subroutine:

- Assigns a set of processes specified by their process IDs (PIDS) or process group IDs (PGID) to a specified superclass or subclass, thus overriding the automatic class assignment or a prior manual assignment.
- · Cancels a previous manual assignment for the specified processes, allowing the processes to be subjected to the automatic assignment rules again.

The target processes are identified by their process ID (pid) or by their process group ID (pgid). The wlm_assign subroutine allows specifying processes using a list of pids, a list of pgids, or both.

The name of a valid superclass or subclass must be specified to manually assign the target processes to a class. If the target class is a superclass, each process is assigned to one of the subclasses of the specified superclass according to the assignment rules for the subclasses of this superclass.

A manual assignment remains in effect (and a process remains in its manually assigned class) until:

- · The process terminates.
- The Workload Manager (WLM) is stopped. When WLM is restarted, the manual assignments in effect when WLM was stopped are lost.
- The class the process has been assigned to is deleted.
- · The manual assignment for the process is canceled.
- · A new manual assignment overrides a prior one.

The name of a valid superclass or subclass must be specified to manually assign the target processes to a class. The assignment can be done or canceled at the superclass level, the subclass level, or both. The interactions between automatic assignment, inheritance and manual assignment are detailed in the Manual class assignment in Workload Manager in Operating system and device management

Flags in the wa versflags field described below are used to specify if the requested operation is an assignment or cancellation and at which level.

To assign a process to a class or cancel a prior manual assignment, the caller must have authority both on the process and on the target class. These constraints translate into the following:

- · The root user can assign any process to any class.
- · A user with administration privileges on the subclasses of a given superclass (that is, the user or group name matches the user or group names specified in the attributes adminuser and admingroup of the superclass) can manually reassign any process from one of the subclasses of this superclass to another subclass of the superclass.
- · A user can manually assign the user's own processes (same real or effective user ID) to a superclass or a subclass, for which the user has manual assignment privileges (that is, the user or group name matches the user or group names specified in the attributes authuser and authgroup of the superclass or the subclass).

This defines three levels of privilege among the persons who can manually assign processes to classes, root being the highest. For a user to modify or terminate a manual assignment, the user must be at the same level of privilege as the person who issued the last manual assignment, or higher.

Note: The wlm assign subroutine works with the in-core WLM data structures. Even if the WLM current configuration is a set, it applies to the currently loaded regular configuration. If an assignment is made to a class that does not exist in all configurations of the set, it will be lost when the first configuration that does not contain this class is activated (when the class is deleted).

Parameter

args

Specifies the address of the struct wlm_assign data structure containing the parameters for the desired class assignment.

The following fields of the wlm_args structure and the embedded substructures can be provided:

wa_versflags

Needs to be initialized with WLM_VERSION. The flags values available, defined in the sys/wlm.h header file,

- WLM ASSIGN SUPER
- WLM_ASSIGN_SUB
- WLM ASSIGN BOTH
- WLM_UNASSIGN_SUPER
- WLM_UNASSIGN_SUB
- WLM_UNASSIGN_BOTH

Specifies the address of the array containing the process IDs of processes to be manually assigned. When this list is empty, a NULL pointer can be passed together with a count of zero (0).

Specifies the number of PIDS in the above array. Could be zero (0) if using only pgids to identify the processes.

wa_pids

wa_pid_count

wa_pgids

Specifies the address of the array containing the process group identifiers (pids) of processes to be manually assigned. When this list is empty, a NULL pointer can be

passed together with a count of zero (0).

Specifies the number of PGIDs in the above array. Could be zero (0) if using only pids to identify the processes. If both pids and pgids counts are zero (0), no process is assigned, but the operation is considered successful. Specifies the full name of the superclass (super_name) or

the subclass (**super_name.sub_name**) of the class you want to manually assign processes to. The class name field is ignored when canceling an existing manual

assignment.

Return Values

wa_pgid_count

wa classname

Upon successful completion, the **wlm_assign** subroutine returns a value of 0. If the **wlm_assign** subroutine is unsuccessful, a non-0 value is returned. The routine is considered successful if some of the target processes are not found, (to account for process terminations) or are not assigned/deassigned due to a lack of privileges, for instance. If none of the processes in the lists can be assigned/deassigned, this is considered an error.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

Manual class assignment in Workload Manager and Workload Manager application programming interface in *Operating system and device management*.

wlm_change_class Subroutine

Purpose

Changes some of the attributes of a class.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm change class (wlmargs)

struct wlm_args *wlmargs;

Description

The **wlm_change_class** subroutine changes attributes of an existing superclass or subclass. Except for its name, any of the attributes of the class can be modified by a call to **wlm_change_class**.

- If the name of a valid configuration is passed in the **confdir** field, the subroutine updates the Workload Manager (WLM) properties files for the target configuration.
- If a null string ('\0') is passed in the confdir field, the changes are applied only to the in-core WLM data.
 No WLM properties file is updated.

The structure of type **struct class definition**, which is part of **struct wlm args**, has normally been initialized with a call to wim init class definition. Once this has been done, initialize the required fields of this structure (such as the name of the class to be modified) and the fields corresponding to the class attributes you want to modify. For a description of the possible values for the various class attributes and their default values, refer to the description of wlm.h in the AIX 5L Version 5.3 Files Reference.

The caller must have root authority to change the attributes of a superclass and must have administrator authority on a superclass to change the attributes of a subclass of the superclass.

Note: Do not specify a set in the confdir field of the wlm_args structure. The wlm_change_class subroutine cannot apply to a set of time-based configurations.

Parameters

wlmargs Specifies the address of the struct wlm_args data structure containing the class_definition structure for the class to be modified.

The following fields of the wlm args structure and the embedded substructures need to be provided:

versflags confdir	Needs to be initialized with WLM_VERSION . Specifies the name of the WLM configuration the target class belongs to. It must be either the name of a valid subdirectory of /etc/wlm or an empty string (starting with '\0').
	If the name is a valid subdirectory, the relevant class description file in the given configuration are modified.
	If the name is a null string, no description files are updated. The modified class attributes are passed to the kernel similarly to a call to wim_load .
name	Specifies the name of the superclass or of the subclass to be modified. If this is a subclass name, it must be of the form super_name.sub_name . There is no default for this field.

All the other fields can be left at their initial value as set by wlm_init_class_definition if the user does not wish to change the current values.

Return Values

Upon successful completion, the wim change class subroutine returns a value of 0. If the wlm change class subroutine is unsuccessful, a nonzero value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

The wlm.h header file.

Workload Manager application programming interface in Operating system and device management.

wlm_check subroutine

Purpose

Check a WLM configuration.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
int wlm check ( config)
char *config;
```

Description

The wlm check subroutine checks the class definitions and the coherency of the assignment rules file(s) (syntax, existence of the classes, validity of user and group names, application path names, etc.) for the configuration whose name is passed as an argument.

If config is a null pointer or points to an empty string, wlm_check performs the checks on the configuration files, in the configuration pointed to by /etc/wlm/current.

The wlm_check subroutine can apply to a configuration set. If config is a configuration set name (or if config is not provided and current is a configuration set), the checks mentioned above are performed on all configurations of the set, after checking the set itself.

Parameter

config

A pointer to a character string. This pointer should be:

- · The address of a character string representing the name of a valid configuration (a subdirectory of /etc/wlm)
- · A null pointer
- A pointer to a null string ("")

If config is a null pointer or a pointer to a null string, the configuration files in the directory pointed to by /etc/wlm/current (active configuration) is checked for errors. Otherwise, the configuration files in directory /etc/wlm/<config_name> is checked.

Return Values

Upon successful completion, a value of 0 is returned. If the wlm check subroutine is unsuccessful a non 0 value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the header file svs/wlm.h.

Related Information

The wlm.h header file.

System Management Concepts: Operating System and Devices, Workload management in Operating system and device management, Automatic class Assignment.

The rules file.

wlm_classify Subroutine

Purpose

Determines which classes a process is assigned to.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
int wlm classify (config, attributes, class, len)
char *config;
char *attributes;
char *class;
int *len;
```

Description

The wlm_classify subroutine must be passed the name of a valid configuration and a set of process attributes in a format identical to the format of the rules file (assignment rules). The names of the classes are copied into the area pointed to by class. The integer pointed to by len contains the size of the class names area on input and the number of matches on output. If the area pointed to by class is not big enough to contain the names of all the potential matches, an error is returned.

The normal use of the **wlm classify** routine is to explicitly provide all the process classification attributes: user name, group name, application pathname, type, and tag when applicable. This gives a match to a single class. To implement "what if" scenarios, the interface allows you to leave some of the attributes unspecified by using a hyphen ('-') instead. This may lead to multiple classes the process could be assigned to, depending on the values of the unspecified attributes. If all the attributes are left unspecified, an error is returned.

The attributes string is provided in a format identical to the format of the attributes in the rules file: a list of attribute values separated by spaces. The order of the attributes in the assignment rules is:

- 1. reserved: must be a hyphen ('-')
- 2. user name
- 3. group name
- 4. application pathname
- 5. type of application
- 6. tag

Each field can have at most one value. Exclusion (!), attribute value groupings (\$), comma separated lists and wild cards are not allowed. For the type field, the AND operator "+" is allowed, since a process can

have several of the possible values for the type attribute at the same time. For instance a process can be a 32 bit process and call plock, or be a 64 bit fixed priority process.

Here are examples of valid attributes strings:

```
"- bob staff /usr/bin/emacs - -"

"- - /usr/sbin/dbserv - _DB1"

"- devlt - 32bit+fixed"

"- sally"
```

The class name(s) returned by the function in the *class* buffer is fully-qualified, null-terminated class names of the form **supername.subname**.

This function does not require any special privileges and can be called by all users.

Parameters

config

Specifies a pointer to a string containing the name of a valid Workload

Manager (WLM) configuration (the name of a subdirectory of /etc/wlm). If a
null string ('\0') is given, the wlm_classify subroutine uses current as the
default configuration.

If the configuration is a set of time-based configurations, either because *config* or *current* is a configuration set, the subroutine will apply to the currently

applicable configurations of the set.

attributes Specifies the address of a string, with the format described above, containing

a list of values for the process attributes used for automatic classification of

processes.

class Specifies a pointer to a buffer where the name of the class the process could

be assigned to is returned as consecutive null-terminated character strings. Specifies a pointer to an integer containing the length in bytes of the buffer pointed to by *class* when calling **wlm_classify** and the actual number of class

names copied into the class buffer upon successful return.

Return Values

len

Upon successful completion, the **wlm_classify** subroutine returns a value of 0. In case of error, a non-0 value is returned.

When a non-0 value is returned, the content of the **class** buffer and the value of the integer pointed to by **len** are unspecified.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

Workload Manager rules File in AIX 5L Version 5.3 Files Reference.

Automatic assignment ("wlm_classify Subroutine" on page 553) in *Operating system and device management*.

wlm_class2key Subroutine

Purpose

Class name to key translation.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm_class2key (struct wlm_args *args, wlm_key_t *key)

Description

The wlm_class2key subroutine generates a 64-bit numeric key from a WLM class name. The wlm_class2key subroutine is provided for applications gathering high volumes of per-class usage statistics or accounting data and allows those applications to save storage space by compressing the class name (up to 34 characters long) into a 64-bit integer. The wlm_key2class subroutine can then get the key-to-class name conversion for data reporting purposes

Parameters

wlm_args

Only 2 fields need to be initialized in the wlm_args structure pointed to by args:

- cl_def.data.descr.name specifies the null terminated full name of the class (<super_name>.<subname> for a subclass).
- versflags initialized with WLM_VERSION and optionally WLM_MUTE.

Return Values

If the wlm_class2key subroutine is successful, a value of 0 is returned. If the wlm_class2key subroutine is unsuccessful, an error code is returned.

Error Codes

If the wlm_class2key subroutine is unsuccessful, one of the following error codes is returned:

WLM_NOT_INITED Missing call to wlm_init.
WLM_EFAULT Invalid key or args pointer.

WLM BADCNAME The class name contains invalid characters.

Related Information

The wlm endkey subroutine.

The wlm initkey subroutine.

The wlm_key2class subroutine.

wlm_create_class Subroutine

Purpose

Creates a new Workload Manager (WLM) class.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
```

int wlm create class (wlmargs)

struct wlm args *wlmargs;

Description

The wlm_create_class subroutine creates a new class for a given WLM configuration using the values passed in the data structure of type struct wlm_args pointed to by wlmargs.

- If the name of a configuration is passed in the confdir field, the subroutine updates the WLM properties files for the target configuration. When creating the first subclass of a superclass, the subroutine creates a subdirectory of /etc/wlm/<confdir> with the name of the superclass and create the WLM properties files in this new directory. The newly created properties files have entries for the Default and Shared subclass automatically created in addition to entries for the new subclass.
- If a null string ("\0") is passed in the confdir field, the new superclass or subclass is created only in the in-core WLM data. No WLM properties file are updated. In that case, the new class definition is lost if WLM is stopped and restarted, or if the system reboots.

The structure of type **struct class definition**, which is part of **struct wlm args**, has normally been initialized with a call to wlm_init_class_definition. Once this has been done, initialize the fields of this structure which have no default value (such as the name of the new class) or for which the desired value is different from the default value. For a description of the possible values for all the class attributes and their default values, refer to the description of wlm.h in the AIX 5L Version 5.3 Files Reference.

The caller must have root authority to create a superclass and must have administrator authority on a superclass to create a subclass of the superclass.

Note: Do not specify a set in the *confdir* field of the wlm args structure. The wlm create class subroutine cannot apply to a set of time-based configurations.

Parameter

wlmargs

Specifies the address of the struct wlm_args data structure containing the class_definition structure for the new class to be created.

The following fields of the wlm_args structure and the embedded substructures need to be provided:

versflags confdir

Needs to be initialized with WLM VERSION.

Specifies the name of the WLM configuration the new class is to be added to. It must be either the

name of a valid subdirectory of /etc/wlm or an empty string (starting with '\0').

If the name is a valid subdirectory, the new class data is added to the given WLM configuration's

class description files.

If the name is a null string, no description files are updated. The new class is created and the data

is passed to the kernel immediately.

name

Specifies the name of the superclass or of the subclass to be created. If this is a subclass name, it

must be of the form super_name.sub_name. There is no default for this field.

All the other fields can be left at their default value if the user does not wish to use specific values.

Return Values

Upon successful completion, the wim create class subroutine returns a value of 0. If the wlm_create_class subroutine is unsuccessful, a nonzero value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

The mkclass command, chclass command, rmclass command.

The wlm change class ("wlm change class Subroutine" on page 550) subroutine, wlm delete class ("wlm delete class Subroutine") subroutine.

Workload management in Operating system and device management.

wlm_delete_class Subroutine

Purpose

Deletes a class.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h> int wlm_delete_class (wlmargs) struct wlm_args *wlmargs;

Description

The wim_delete_class subroutine deletes an existing superclass or subclass. A superclass cannot be deleted if it still has subclasses other than Default and Shared defined.

- If the name of a valid configuration is passed in the confdir field, the subroutine updates the Workload Manager (WLM) properties files for the target configuration, removing all references to the class to be deleted.
- If a null string ('\0') is passed in the confdir field, the class is deleted only from the in-core WLM data structures. No WLM properties file is updated. This is normally used to delete a class which was also only created in the in-core WLM data structures. Otherwise, the class deletion is temporary and the class will be created again when WLM is updated or restarted with a configuration where the class exists in the classes file.

The caller must have root authority to delete a superclass and must have administrator authority on a superclass to delete a subclass of the superclass.

Note: Do not specify a set in the *confdir* field of the wlm args structure. The wlm delete class subroutine cannot apply to a set of time-based configurations.

Parameter

wlmargs

Specifies the address of the struct wlm_args data structure containing the information about the class to be deleted.

The following fields of the wlm args structure and the embedded substructures need to be provided:

versflags confdir

name

Needs to be initialized with WLM_VERSION. Specifies the name of the WLM configuration the target class belongs to. It must be either the name of a valid subdirectory of /etc/wlm or an empty string (starting with '\0').

If the name is a valid subdirectory, the relevant class description files in the specified configuration are modified.

If the name is a null string, no description files are updated. The class is removed from the kernel WLM data structures.

Specifies the name of the superclass or of the subclass to be deleted. If this is a subclass name, it must be of the form **super name.sub name**. There is no default for this field.

All the other fields can be left uninitialized for this call.

Return Values

Upon successful completion, the wIm_delete_class subroutine returns a value of 0. If the wlm_delete_class subroutine is unsuccessful, a non-0 value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Workload management in *Operating system and device management*.

wlm_endkey Subroutine

Purpose

Frees the classes to keys translation table.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm_endkey(struct wlm_args *args, void *ctx)

Description

The wim_endkey subroutine frees the classes to the keys translation table. The memory area pointed to by ctx is freed.

Parameters

- ctx Points to the memory area to be freed. A pointer to a wlm_args structure: wlm_args

versflag field is the only field in the structure that needs to be initialized with WLM_VERSION

and optionally WLM_MUTE.

Return Values

When the wlm_endkey operation is successful, it returns a value of 0, and if it is unsuccessful, it returns an error code.

Error Codes

If the wlm_endkey subroutine is unsuccessful, one of the following error codes is returned:

WLM_BADVERS Bad version number. WLM_NOT_INITED Missing call to wlm_init. WLM_EFAULT Invalid ctx or args argument.

Related Information

The wlm class2key subroutine.

The wlm_initkey subroutine.

The wlm key2class subroutine.

wlm_get_bio_stats subroutine

Purpose

Read the WLM disk I/O statistics per class or per device.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/types.h>
```

```
#include <sys/wlm.h>
```

```
int wlm_get_bio_stats ( dev, array, count, class, flags)
```

```
dev_t dev;
void *array;
int *count;
char *class;
int flags;
```

Description

The wlm_get_bio_stats subroutine is used to get the WLM disk IO statistics. There are two types of statistics available:

- The statistics about disk IO utilization per class and per devices, returned by wIm_get_bio_stats in wlm_bio_class_info_t structures,
- · The statistics about the disk IO utilization per device, all classes combined, returned by wlm_get_bio_stats in wlm_bio_dev_info_t structures.

The type of statistics returned by the function is predicated on the value of the flags argument. The flags argument, together with the dev and class arguments, are used to restrict the scope of the function to a class or a set of classes and/or a device or a set of devices. If the value passed to the routine in the count argument is equal to zero (0), wlm get bio stats does not copy any device statistics (and, in this case, the array argument can be a NULL pointer but sets this count to the number of elements in scope for the specific set of parameters. This is a way of finding out how big an array is needed to get all the information for a given set of classes and devices.

wlm get bio stats does not require any special privileges and is accessible to all users. wlm get bio stats fails if WLM is off.

Parameters

flags

Need to be initialized with **WLM_VERSION**. Optionally, the following flag values can be or'ed to **WLM_VERSION**:

WLM SUPER ONLY

Limits the scope to superclasses only

WLM_SUB_ONLY

Limits the scope to subclasses only

WLM BIO CLASS INFO

Per class statistics requested

WLM BIO DEV INFO

Per device statistics requested

WLM_BIO_ALL_DEV

Requests statistics for all devices. When this flag is set, the value passed in the *dev* argument is ignored.

WLM BIO ALL MINOR

Requests statistics for all devices associated with a given major number. When this flag is set, only the major number part of the value passed in the *dev* argument is used.

WLM_VERBOSE_MODE

Shows the system defined subclasses (*Default* and *Shared*)even if they have not been modified by a WLM administrator.

One of the flags WLM_BIO_CLASS_INFO or WLM_BIO_DEV_INFO (and only one) must be specified. WLM_SUPER_ONLY and WLM_SUB_ONLYare mutually exclusive.

Device identification (major, minor) of a disk device.

- If dev is equal to 0, the statistics for all devices are returned (even if WLM_BIO_ALL_DEV is not specified in the flags argument).
- If dev is not equal to 0 and WLM_BIO_ALL_MINOR is specified in the flags argument, the statistics for all disk devices with the same major number specified in dev are returned.
- If dev is not equal to 0 and WLM_BIO_ALL_MINOR is not specified in the flags argument, only the statistics for the disk device with the major and minor numbers specified in dev are returned.

Pointer to an array of wlm_bio_class_info_t structures (when WLM_BIO_CLASS_INFO is specified in the flags argument) or an array of wlm_bio_dev_info_t structures (when WLM_BIO_DEV_INFO is specified in the flags argument). A NULL pointer can be passed together with a count of 0 to determine how many elements are in scope for the set of arguments passed.

The address of an integer containing the maximum number of elements to be copied into the array above. If the call to <code>wlm_get_bio_stats</code> is successful, this integer will contain the number of elements actually copied. If the initial value is equal to zero (0), <code>wlm_get_bio_stats</code> sets this value to the number elements selected by the specified combination of flags and class.

dev

array

count

A pointer to a character string containing the name of a superclass or subclass. If class is a pointer to an empty string (""), the information for all classes are returned. The class parameter is taken into account only when the flag WLM_BIO_CLASS_INFO is set.

Return Values

Upon successful completion, a value of 0 is returned and the value pointed to by count is set to the number of elements copied into the array of structures pointed to by array. If the wlm_get_bio_stats subroutine is unsuccessful a non 0 value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the header file **sys/wlm.h**.

Related Information

The wlm.h header file.

wlm_get_info Subroutine

Purpose

Read the characteristics of superclasses or subclasses.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
int wlm get info ( wlmargs, info, count)
struct wlm args *wlmargs;
struct wlm_info *info
int *count
```

Description

The wlm get info subroutine is used to get the characteristics of the classes defined in the active Workload Manager (WLM) configuration, together with their current resource usage statistics. For a detailed description of the fields of the structure wim info, refer to the description of the wim.h header file in the AIX 5L Version 5.3 Files Reference documentation.

By default, the scope of the wIm_get_info subroutine is all the superclasses and all the subclasses. This scope can be limited to a subset of the classes using flags in the versflags field of wlm_args or a superclass or subclass name in the name field of the substructure class definition of wlm args.

The information related to the superclasses and subclasses within the scope of wlm_get_info are copied to the array of wlm_info structures pointed to by info. The total number of classes for which information is copied to the array at info is limited to the value of the integer pointed to by count. If the routine is successful, the value of the integer pointed to by count is set to the actual number of classes copied. If the value passed to the routine for the count is equal to zero (0), wlm_get_info does not copy any class statistics but sets this count to the number of classes in scope for the specific set of parameters. This is a way of finding out how big an array is needed to get all the information for a given set of classes (superclasses or subclasses).

This is a way of finding out how big an array is needed to get all the information for a given set of classes (superclasses or subclasses).

The wim get info subroutine does not require any special privileges and is accessible to all users. wlm get info fails if WLM is off.

Parameters

wlmargs

The address of a **struct wlm args** data structure.

The following fields of the wlm_args structure and the embedded substructures need to be provided:

versflags

Needs to be initialized with WLM_VERSION. Optionally, the following flag value can be or'ed to WLM_VERSION:

WLM SUPER ONLY

Limits the scope to superclasses only

WLM SUB ONLY

Limits the scope to subclasses only

WLM VERBOSE MODE

Shows the system-defined subclasses (Default and Shared) even if they have not been modified by a WLM administrator.

WLM SUPER ONLY and WLM SUB ONLY are mutually exclusive.

name Contains either a null string or the name of a valid superclass or subclass (in the form Super.Sub). This field can be used in conjunction with the flags to further narrow the scope of wlm get info:

- If the name of a subclass is provided, wIm get info returns the statistics only for the specified subclass.
- · If the name of a superclass is provided or if none of the WLM SUPER ONLY and WLM_SUB_ONLY flag is provided, wlm_get_info returns the statistics for the specified superclass and all its subclasses.
- If the name of a superclass is provided together with WLM_SUPER_ONLY, wlm get info returns only the statistics for the specified superclass.
- · If the name of a superclass is provided together with WLM_SUB_ONLY, wlm_get_info returns the statistics for all the subclasses of the specified superclass.

All the other fields of the **wlm args** structure can be left uninitialized.

info The address of an array of structures of type **struct wlm_info**. Upon successful return from wlm_get_info, this array contains the WLM statistics for the classes selected.

The address of an integer containing the maximum number of element (of type wlm_info) for count wlm get info to copy into the array above. If the call to wlm get info is successful, this integer contains the number of elements actually copied. If the initial value is equal to zero (0), wilm get info sets this value to the number of classes selected by the specified combination of versflags and name above.

Return Values

Upon successful completion, the wlm_get_info subroutine returns a value of 0. If the wlm_get_info subroutine is unsuccessful a non-0 value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

The wimstat command.

The wlm.h header file.

wlm get procinfo Subroutine

Purpose

Retreives per-process Workload Manager information.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h> int wlm get procinfo (pid, wlmpinfop) pid_t pid; struct wlm_procinfo *wlmpinfop;

Description

The wlm_get_procinfo subroutine returns Workload Manager information for the process associated with the pid parameter, into the buffer pointed to by the wImpinfop parameter. If process total accounting is disabled, the related fields (totalconnecttime, termtime, totalcputime, and totaldiskio) are set to -1. When WLM is on, the class name of the process is set in the classname field of the wlm_procinfo structure. When WLM is off, this field is set to Unclassified.

Parameters

pid Indicates from which process to retrieve the Workload Manager information. Points to the buffer where the Workload Manager information is stored. wlmpinfop

Return Values

Upon successful completion, the wlm_get_procinfo subroutine returns a zero. If the wlm_get_procinfo subroutine is unsuccessful, a nonzero value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

The wlm.h header file.

wlm_init_class_definition Subroutine

Purpose

Initializes a variable of type struct class_definition, defined in <sys/wlm.h> for use as an argument to Workload Manager (WLM) API function calls.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
int wlm init class definition ( wlmargs)
struct wlm_args *wlmargs;
```

Description

The wlm init class definition subroutine initializes or reinitializes the data structure of type struct class_definition, which is part of the argument of type struct wlm_args pointed to by wlmargs (field class), so that this data structure can be used as an argument for the class management subroutines of the WLM API library. The purpose of this call is to allow applications to initialize only the fields that are relevant for the operation they execute. For example, to change a CPU limit or share for an existing class after a call to wim init class definition, the application has to initialize the fields corresponding to the values it wishes to modify.

This routine initializes all values to specific invalid values so that the WLM library routines can find out which fields have been explicitly initialized by the user. This way, they can set or modify only the corresponding attributes. When creating a class, for instance, it is different to leave a class attribute at its invalid value set by wIm initialize than setting its value to the current default value for the attribute. In the former case, the attribute will not appear in the property file. In the latter, it will appear and will be set with the value passed.

This makes a difference if a WLM administrator decides to change the default value for an attribute using the special stanza default in a property file. For instance, the system default for the inheritance attribute is no. If a WLM administrator wants the inheritance to be yes by default, using this special stanza, all the classes in the classes property file, for which the **inheritance** attribute has not been specified, will now use the default of yes. Those for which the inheritance attribute has been specified with its old default of no will not have inheritance.

Parameter

wlmargs

Specifies the address of the struct wlm_args data structure containing the class_definition structure to be initialized.

Only the versflags field of the wlm_args structure passed need to be initialized with WLM_VERSION.

Return Values

Upon successful completion, the wlm_init_class_definition subroutine returns a value of 0. If the wlm init class definition subroutine is unsuccessful a non-0 value is returned.

Error Codes

There are two possible error code returned by wlm_init_class_definition:

BADVERSION Specifies the value of the flags parameter is not a supported

version number.

NOTINITED Specifies the WLM API has not been initialized by a prior call to

wlm_init.

Related Information

The wlm_change_class ("wlm_change_class Subroutine" on page 550) subroutine, wlm_create_class ("wlm create class Subroutine" on page 555) subroutine, wlm delete class ("wlm delete class Subroutine" on page 557) subroutine.

wlm_initialize Subroutine

Purpose

Prepares Workload Manager (WLM) for use by an application.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm_initialize (flags)

int flags;

Description

The wlm_initialize subroutine initializes the WLM API for use with an application program. It is mandatory to call wim initialize prior to using the WLM API. Otherwise, all other WLM API function calls return an error.

Parameter

flags Specifies that the format is the same as the versflag field

> of the wlm_args structure. The value for the argument must have the version number in the upper 4 bits (WLM_VERSION) possibly or'ed with a flag in the lower

28 bits.

Return Values

Upon successful completion, the wlm_initialize subroutine returns a value of 0. If the wlm_initialize subroutine is unsuccessful a non-0 value is returned.

Error Codes

There are two possible error codes returned by wlm_initialize:

BADVERSION The value of the *flags* parameter is not a supported version

number.

WLMINITED There has already been a previous call to wlm_initialize.

Related Information

The wlm.h header file.

wlm_initkey Subroutine

Purpose

Allocates and initializes the classes to keys translation table.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm_initkey (struct wlm_args *args, void **ctx)

Description

The wlm_initkey subroutine allocates a block of memory, builds the keys <==> class names translation table and returns its address into the ctx argument.

Parameters

args

Only 2 fields need to be initialized in the wlm_args structure pointed to by args:

- confdir specifies the null-terminated name of the WLM configuration to be searched (the name can be "current" to specify the current configuration). If the configuration name passed is an empty string (starts with '\0'), then all the configurations in /etc/wlm are searched.
- versflags initialized with WLM_VERSION and optionally WLM_MUTE.

Return Values

If the wlm initkey subroutine is successful, a value of 0 is returned. If the wlm initkey subroutine is unsuccessful, an error code is returned.

Error Codes

If the wlm initkey subroutine is unsuccessful, one of the following error codes is returned:

WLM_BADVERS Bad version number. WLM_NOT_INITED Missing call to wlm_init. WLM NOMEM Not enough memory.

WLM_NOCLASS Specified configuration does not exist.

WLM EFAULT Invalid ctx or args argument.

Related Information

The wlm_endkey subroutine.

The wlm class2key subroutine.

The wlm kev2class subroutine.

wlm_key2class Subroutine

Purpose

Retrieves a class name from a key.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm key2class (struct wlm_args *args, wlm_key_t key, void *ctx)

Description

The wlm key2class subroutine retrieves a class name from a 64-bit key calculated using the wlm_class2key subroutine. The key-to-class translation is made by going through the WLM configuration files for the configuration named in the wlm args structure pointed to by args (or all the WLM configuration files, if no configuration name is given), and translating all the class names to a 64-bit key until the matching key is found.

This process is time consuming and WLM offers the subroutines wim initkey and wim endkey for applications needing to translate several 64-bit keys back to class names. These subroutines can be used in conjunction with the wlm_key2class subroutine to speed up searches.

The wlm initkey subroutine allocates a block of memory, calculates the keys corresponding to the class names in the configuration(s) in scope, stores the names with the corresponding keys in the memory buffer, and returns its address. This address is passed to the wlm key2class subroutine using the ctx argument, so that wim key2class only needs to search through the memory buffer.

After all keys have been translated into class names, the application must call wim endkey to free the memory buffer. Alternatively, for an application translating only one key, it is possible to call wim key2class directly using a null pointer in the ctx argument. This causes the wim key2class subroutine to internally call wlm initkey and wlm endkey.

The method of retrieving class names through the WLM configuration files implies that if a class has been deleted between the time the class name was converted into a key and the call to the wim key2class subroutine, the name corresponding to the key will not be found and the wlm_key2class subroutine returns an error.

Parameters

- args

A pointer to a **wlm_args** structure:

- · confdir field needs to be initialized as described in wlm_initkey if wlm_initkey has not been previously invoked (ctx == NULL). Otherwise, the **confdir** field is ignored.
- versflags field needs to be initialized with WLM_VERSION and optionally WLM_MUTE.

- ctx The context handler returned by wlm_initkey, or a NULL pointer otherwise. .

The search key. - key

Return Values

When the wlm_key2class operation is successful, the first class name matching the value of the key is returned in the name sub-field of the wim args structure pointed to by args.

Error Codes

If the wlm key2class subroutine is unsuccessful, one of the following error codes is returned:

WLM BADVERS Bad version number. WLM NOT INITED Missing call to wlm init. WLM NOMEM Not enough memory.

WLM_NOCLASS No class matching the key was found.

WLM_EFAULT Invalid ctx or args argument.

Related Information

The wlm_class2key subroutine.

The wlm_endkey subroutine.

The wlm initkey subroutine.

wlm load Subroutine

Purpose

Loads a Workload Manager (WLM) configuration into the kernel.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h> int wlm load (wlmargs)

struct wlm args *wlmargs;

Description

The wlm_load subroutine loads into the kernel the property files for the WLM configuration passed in the confdir field of the wlmargs structure. The confdir field may also refer to a set of time-based configurations, in which case the appropriate configuration of the set will be loaded and the WLM daemon will later switch to the other configurations of the set on a time basis.

If the WLM is running and confdir is not current, this leads to switch to the specified configuration (or configuration set).

If the WLM is running and *confdir* is current, **wlm load** will refresh the current WLM configuration into the kernel. If a superclass name is given in the name field of the class_definition substructure, only the subclasses of the given superclass are refreshed. In this context:

- The wlm load subroutine is accessible to root users and to users with administration privileges on the subclasses of the superclass. In all other cases, the wim load subroutine is only accessible to root users.
- The wlm load subroutine cannot be used to change the mode of operation of WLM (for example, to switch between active and passive modes).
- If current is a configuration set, confdir must be given in the form current/config where config is the regular configuration of the set the superclass belongs to. If config is the active configuration of the set, the changes will take effect immediately, otherwise they will take effect the next time config is made active.

If the caller of wlm load has root privileges and does not specify a superclass, the flags passed in versflags can be used to start WLM in active or passive mode, switch between active and passive modes, or enable/disable the rset bindings or the process or class total limits. The wlm load subroutine cannot be used to stop WLM. Use the wlm_set subroutine instead.

Parameter

wlmargs

Specifies the address of the struct wlm_args data structure containing information about the configuration (or configuration set or superclass) to be loaded and the mode of operation of WLM.

The following fields of the wlm_args structure and the embedded substructures can be provided:

versflags Needs to be initialized with WLM_VERSION. May be ORed with WLM_MUTE

for wlm_load to be silent.

If no change must be done to the mode of operation of WLM, it must be ORed

with WLM_TEST_ON (mandatory if superclass is specified).

Otherwise, one of the mutually exclusive flags (WLM_ACTIVE,

WLM_CPUONLY, or WLM_PASSIVE) must be given. One or more of the WLM_BIND_RSETS, WLM_PROCTOTAL, or WLM_CLASSTOTAL flags can

be given optionally.

confdir Specifies the name of the WLM configuration to be loaded into the kernel. It

> must be either the name of a valid configuration or configuration set in the /etc/wlm subdirectory, the current string to refer to the active configuration, or, if superclass is specified and current is a configuration set, it must indicate which configuration of current set the superclass belongs to in the form: current/config (this is different from specifying config only, which is considered

a configuration switch request).

Specifies the name of a superclass. This is used to refresh only the name

subclasses of a given superclass.

Return Values

Upon successful completion, the wlm_load subroutine returns a value of 0. If the wlm_load subroutine is unsuccessful, a nonzero value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

The wimcntrl command.

The wlm_set ("wlm_set Subroutine" on page 572) subroutine.

wlm_read_classes Subroutine

Purpose

Reads the characteristics of superclasses or subclasses.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
int wlm_read_classes (wlmargs, class tbl, nclass)
struct wlm args *wlmargs;
struct class_definition *class tbl;
int *nclass;
```

Description

The wlm_read_classes subroutine is used to get the characteristics of the superclasses or the subclasses of a given subclass of a Workload Manager (WLM) configuration.

• If the name of a configuration is passed in the **confdir** field, the **wlm_read_classes** subroutine reads the property files of the classes of the specified configuration. If confdir is set to a null string ('\0'), wim_read classes reads the classes' characteristics from the in-core WLM data structures when WLM is on (and returns an error when WLM is off).

Note: These values may be different from the values in the property files of the configuration pointed to by /etc/wlm/current. For instance when a WLM administrator has modified the property files for the configuration pointed to by /etc/wlm/current but has not refreshed WLM yet. Another example is if applications dynamically created or modified classes through the API without saving the changes in the *current* configuration property files.

If your application specifically needs to access the properties of the classes as described in the /etc/wlm/current configuration, you must specify current as the configuration name in confdir.

If the name of a set of time-based configurations is passed in the confdir field, the wlm_read_classes subroutine reads the classes of the currently applicable configuration of the set.

- If the name of a valid superclass of the given configuration is passed in the name field of the class descr substructure of wlmargs, wlm read classes reads the property files for the subclasses of this superclass. If a null string ('\0') is passed in the name field, wlm_read_classes reads the property files for the superclasses of the WLM configuration described above.
- · When wim read classes is successful, the characteristics of the superclasses or subclasses are copied into the array of class definition structures pointed to by class tbl. The integer value pointed to by nclass indicates the maximum number of class definitions to be copied. Upon successful return from the function, this value reflects the actual number of classes read.

If the number of elements copied by wim read classes is strictly smaller than the number of elements passed as an argument, all the classes have been read. If it is equal, it may mean that some classes were not copied into the class_tbl array because its size is too small.

The maximum number of classes read by wlm read classes is 67 (64 user-defined superclasses plus System, Shared and Default) when reading superclasses and 63 (61 user-defined subclasses plus Shared and Default) when reading subclasses characteristics.

 Upon successful return from wlm read classes, the substructure class of type struct class definition of the structure pointed to by wlmargs contains the default values of various class attributes for the returned set of classes.

This operation does not require any special privileges and is accessible to all users.

Parameter

Specifies the address of a **struct wlm_args** data structure. wlmargs

The following fields of the wlm_args structure and the embedded

substructures need to be provided:

versflags

Needs to be initialized with WLM VERSION.

confdir Specifies the name of a WLM configuration. It must be either the

name of a valid subdirectory of /etc/wlm or a null string (starting with

name Specifies the name of a superclass existing in the specified

configuration or a null string.

All the other fields can be left uninitialized.

Specifies the address of an array of structures of type struct class_tbl

class_definition. Upon successful return from wlm_read_classes, this array

contains the characteristics of the classes read.

Specifies the address of an integer containing the maximum number of nclass

element (class definitions) for wlm_read_classes to copy into the array above. If the call to wim_read_classes is successful, this integer contains the

number of elements actually copied.

Return Values

Upon successful completion, the wlm_read_classes subroutine returns a value of 0. If the wlm_read_classes subroutine is unsuccessful, a nonzero value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Related Information

The Isclass command.

The wlm.h header file.

wlm set Subroutine

Purpose

Sets or queries the Workload Manager (WLM) state.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
```

```
int wlm set ( flags)
int *flags;
```

Description

The wlm_set subroutine is used to set, change, or query the mode of operations of WLM. The state of WLM can be:

OFF Does not classify processes, monitor or regulate resource utilization.

ON in passive mode Classifies the processes and monitors their resource usage but does no regulation. ON in active mode Specifies the normal operating mode where WLM classifies processes, monitors and

regulates the resource usage.

Parameters

flags

Specifies the address of an integer interpreted in a manner similar to the versflags field of the wimargs structure passed to the other API routines. The integer pointed to by flags should be initialized with WLM_VERSION. In addition, one or more of the following values can be or'ed to WLM_VERSION:

WLM TEST ON

Queries the state of WLM without altering it.

WLM_OFF

Turns WLM off.

WLM ACTIVE

Turns WLM on in active mode or transitions from any mode to active mode.

WLM CPU ONLY

Turns WLM on in active mode for CPU resource only, or transitions from any mode to this mode. This is the same as WLM ACTIVE, but only CPU resources are regulated. Other resources (memory, disk IO, and total limits when enabled) are still accounted.

WLM PASSIVE

Turns WLM on in **passive** mode or transitions from any mode to **passive** mode.

WLM BIND RSETS

Requests that WLM takes the resource set bindings into account.

WLM PROCTOTAL

Enables process total limits on resource usage.

WLM CLASSTOTAL

Enables class total limits on resource usage.

Some combinations of the flags above are not legal:

- WLM OFF, WLM ACTIVE, WLM CPU ONLY, and WLM PASSIVE are mutually exclusive.
- WLM BIND RSETS, WLM PROCTOTAL, and WLM_CLASSTOTAL, are ineffective when used together with WLM OFF.
- Only WLM TEST ON is allowed to non-root users.
- If WLM TEST ON is specified, the other flags are ineffective and should not be specified.

Return Values

Upon successful completion, the wlm set subroutine returns a value of 0, and the current state of WLM is returned in the flags parameter. The return value is WLM OFF, WLM ACTIVE, WLM CPU ONLY, or

WLM PASSIVE. When WLM is on in either mode, the WLM BIND RSETS, WLM PROCTOTAL, and WLM CLASSTOTAL, flags are added when appropriate.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

The wlm.h header file.

The wlm_load ("wlm_load Subroutine" on page 569) subroutine.

wlm set tag Subroutine

Purpose

Sets the current process's tag and related flags.

Library

Workload Manager Library (libwlm.a)

Syntax

```
#include <sys/wlm.h>
#include <sys/user.h>
int wlm set tag ( tag, flags)
char *tag;
int *flags;
```

Description

The tag attribute is an attribute of a process that can be set using the Workload Manager (WLM) wim set tag subroutine. This tag is a character string with a maximum length of WLM TAG LENGTH (not including the null terminator). Process tags can be displayed using the **ps** command.

The tag attribute is also one of the process attributes used in the assignment rules to automatically assign a process to a given class. The syntax of the assignment rules precludes the use of special characters in the application tag string. Thus, application tags should be comprised only of upper and lower case letters, numbers and underscores (' ').

The main use of the tag attribute is to allow WLM administrators to discriminate between several instances of the same application, which typically have the same user and group ids, execute the same binary, and, therefore, end up in the same class using the standard classification criteria.

For more details about application tags, refer to Workload Manager application programming interface in Operating system and device management.

When an application sets its tag using wlm_set_tag, it is automatically reclassified according to the current assignment rules and the new tag is taken into account when doing this reclassification.

In addition to the tag itself, the application can also specify flags indicating to WLM if a child process should inherit the tag from its parent after a **fork** or an **exec** subroutine.

A process does not require any special privileges to set its tag.

Parameters

tag

flags

Specifies the address of a character string. An error is returned if this tag is too long.

Specifies the address of an integer interpreted in a manner similar to the versflags field of the wlmargs structure passed to other API routines. The integer pointed to by flags should be initialized with WLM_VERSION. In addition, one or more of the following values can be or'ed to WLM_VERSION:

SWLMTAGINHERITFORK

Specifies that the children of this process inherit the parent's tag on the fork subroutine.

SWLMTAGINHERITEXEC

Specifies that the process retains its tag after a call to the exec subroutine.

Both flags can be set to specify that the children of a tagged process inherits the tag on the fork subroutine and then retains it on the exec subroutine.

Return Values

Upon successful completion, the wlm set tag subroutine returns a value of 0. In case of error, a non-0 value is returned

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

wlm_set_thread_tag_Subroutine

Purpose

Sets the current thread's tag and related flags.

Library

Workload Manager Library (libwlm.a)

Syntax

#include <sys/wlm.h>

int wlm_set_thread_tag (*tag, *flags)

Description

The wim_set_thread_tag subroutine sets or unsets the tag on the current thread. The tag is a character string with a maximum length of the value set with the WLM_TAG_LENGH macro (not including the null terminator). The tag on the thread can be unset by passing a NULL value for the tag parameter or by passing a pointer to a NULL tag.

Setting the tag attribute at the thread-level assigns a thread-level class to the current thread. This allows discriminating between different threads of the same process or application, whereas standard classification criteria fails due to the following reasons:

- These threads have the same user and group IDs (unless the threads have per-thread credentials).
- These threads run the same binary.
- These threads have the same process-level tag.

For a thread with a thread-level tag attribute, the thread-level tag, fixed priority, status, and credentials are used in place of those belonging to the application to classify the thread. The thread-level class is independent and unrelated to the process-level class and is also determined based on the rules of the current WLM configuration.

In addition to the tag itself, the thread also specifies flags indicating to WLM the tag inheritance policy on a fork, exec or pthread create subroutine.

Thread tags can be displayed using the **ps** command. A thread does not require any special privileges to set its tag.

This subroutine is only supported when running in 1:1 mode and will fail if it is invoked by a thread belonging to a process that is running in M:N mode. Threads are only regulated by WLM if their scheduling policy is set to SCHED OTHER.

Parameters

tag

flags

Specifies the address of a character string. An error is returned if the length of this tag exceeds the value set by the WLM_TAG_LENGH macro.

Specifies the address of an integer interpreted in a manner similar to the versflags field of the wlmargs structure passed to other API routines. The integer that flags pointed to should be initialized with the WLM_VERSION macro. In addition, a bitwise OR operation can be applied on the WLM_VERSION macro and one or more of the following values:

TWLMTAGINHERITFORK

Specifies that if the tagged thread makes a fork system call, the child process will inherit the parent's tag. The thread-level tag and class will become process-based in the child.

TWLMTAGINHERITEXEC

Specifies that if the tagged thread makes an exec system call, the process will inherit the parent's tag. The thread-level tag and class will become process based in the process that calls the exec subroutine. The process will inherit the thread-level class if class inheritance is ON for the class or if it was manually assigned; otherwise it will be reclassified according to WLM rules.

Return Values

Upon successful completion, the wlm_set_thread_tag subroutine returns a value of 0. In case of error, a non-0 value is returned.

Error Codes

For a list of the possible error codes returned by the WLM API functions, see the description of the wlm.h header file.

Implementation Specifics

This subroutine is part of the Base Operating System (BOS) Runtime.

wmemchr Subroutine

Purpose

Find a wide-character in memory.

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
wchar_t *wmemchr (const wchar_t * ws, wchar_t wc, size_t n) ;
```

Description

The wmemchr function locates the first occurrence of wc in the initial n wide-characters of the object pointed to be ws. This function is not affected by locale and all wchar t values are treated identically. The null wide-character and wchar t values not corresponding to valid characters are not treated specially.

If **n** is zero, **ws** must be a valid pointer and the function behaves as if no valid occurrence of **wc** is found.

Return Values

The wmemchr function returns a pointer to the located wide-character, or a null pointer if the wide-character does not occur in the object.

Related Information

The wmemcmp ("wmemcmp Subroutine") subroutine, wmemcpy ("wmemcpy Subroutine" on page 578) subroutine, wmemmove ("wmemmove Subroutine" on page 579) subroutine, wmemset ("wmemset Subroutine" on page 579) subroutine.

wmemcmp Subroutine

Purpose

Compare wide-characters in memory.

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
int wmemcmp (const wchar_t * ws1, const wchar_t * ws2, size_t n);
```

Description

The wmemcmp function compares the first n wide-characters of the object pointed to by ws1 to the first n wide-characters of the object pointed to by ws2. This function is not affected by locale and all wchar_t values are treated identically. The null wide-character and wchar t values not corresponding to valid characters are not treated specially.

If n is zero, ws1 and ws2 must be a valid pointers and the function behaves as if the two objects compare equal.

Return Values

The wmemcmp function returns an integer greater than, equal to, or less than zero, accordingly as the object pointed to by ws1 is greater than, equal to, or less than the object pointed to by ws2.

Related Information

The wmemchr ("wmemchr Subroutine" on page 577) subroutine, wmemcpy ("wmemcpy Subroutine") subroutine, wmemmove ("wmemmove Subroutine" on page 579) subroutine, wmemset ("wmemset Subroutine" on page 579) subroutine.

wmemcpy Subroutine

Purpose

Copy wide-characters in memory.

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
wchar t *wmemcpy (wchar t * ws1, const wchar t * ws2, size t n);
```

Description

The wmemcpy function copies n wide-characters from the object pointed to by ws2 to the object pointed to be ws1. This function is not affected by locale and all wchar t values are treated identically. The null wide-character and wchar t values not corresponding to valid characters are not treated specially.

If n is zero, ws1 and ws2 must be a valid pointers, and the function copies zero wide-characters.

Return Values

The **wmemcpy** function returns the value of **ws1**.

Related Information

The wmemchr ("wmemchr Subroutine" on page 577) subroutine, wmemcmp ("wmemcmp Subroutine" on page 577) subroutine, wmemmove ("wmemmove Subroutine") subroutine, wmemset ("wmemset Subroutine") subroutine.

wmemmove Subroutine

Purpose

Copy wide-characters in memory with overlapping areas.

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
wchar_t *wmemmove (wchar t * ws1, const wchar t * ws2, size t n) ;
```

Description

The wmemmove function copies n wide-characters from the object pointed to by ws2 to the object pointed to by ws1. Copying takes place as if the n wide-characters from the object pointed to by ws2 are first copied into a temporary array of n wide-characters that does not overlap the objects pointed to by ws1 or ws2, and then the n wide-characters from the temporary array are copied into the object pointed to by ws1.

This function is not affected by locale and all wchar_t values are treated identically. The null wide-character and wchar t values not corresponding to valid characters are not treated specially.

If **n** is zero, **ws1** and **ws2** must be a valid pointers, and the function copies zero wide-characters.

Return Values

The wmemmove function returns the value of ws1.

Related Information

The wmemchr ("wmemchr Subroutine" on page 577) subroutine, wmemcmp ("wmemcmp Subroutine" on page 577) subroutine, wmemcpy ("wmemcpy Subroutine" on page 578) subroutine, wmemset ("wmemset Subroutine") subroutine.

wmemset Subroutine

Purpose

Set wide-characters in memory.

Library

Standard library (libc.a)

Syntax

```
#include <wchar.h>
wchar_t *wmemset (wchar t * ws, wchar t wc, size t n);
```

Description

The wmemset function copies the value of wc into each of the first n wide-characters of the object pointed to by ws. This function is not affected by locale and all wchar_t values are treated identically. The null wide-character and wchar_t values not corresponding to valid characters are not treated specially. If n is zero, ws must be a valid pointer and the function copies zero wide-characters.

Return Values

The wmemset functions returns the value of ws.

Related Information

The wmemchr ("wmemchr Subroutine" on page 577) subroutine, wmemcmp ("wmemcmp Subroutine" on page 577) subroutine, wmemcpy ("wmemcpy Subroutine" on page 578) subroutine, wmemmove ("wmemmove Subroutine" on page 579) subroutine.

wordexp Subroutine

Purpose

Expands tokens from a stream of words.

Library

Standard C Library (libc.a)

Syntax

```
#include <wordexp.h>
int wordexp ( Words, Pwordexp, Flags)
const char *Words;
wordexp t *Pwordexp;
int Flags;
```

Description

The wordexp subroutine performs word expansions equivalent to the word expansion that would be performed by the shell if the contents of the Words parameter were arguments on the command line. The list of expanded words are placed in the Pwordexp parameter. The expansions are the same as that which would be performed by the shell if the Words parameter were the part of a command line representing the parameters to a command. Therefore, the Words parameter cannot contain an unquoted <newline> character or any of the unquoted shell special characters | (pipe), & (ampersand), ; (semicolon), < (less than sign), or > (greater than sign), except in the case of command substitution. The Words parameter also cannot contain unquoted parentheses or braces, except in the case of command or variable substitution. If the Words parameter contains an unquoted comment character # (number sign) that is the beginning of a token, the wordexp subroutine may treat the comment character as a regular character, or may interpret it as a comment indicator and ignore the remainder of the expression in the Words parameter.

The wordexp subroutine allows an application to perform all of the shell's expansions on a word or words obtained from a user. For example, if the application prompts for a file name (or a list of file names) and then uses the wordexp subroutine to process the input, the user could respond with anything that would be valid as input to the shell.

The wordexp subroutine stores the number of generated words and a pointer to a list of pointers to words in the *Pwordexp* parameter. Each individual field created during the field splitting or path name expansion is a separate word in the list specified by the Pwordexp parameter. The first pointer after the last last token in the list is a null pointer. The expansion of special parameters * (asterisk), @ (at sign), # (number sign), ? (question mark), - (minus sign), \$ (dollar sign), ! (exclamation point), and 0 is unspecified.

The words are expanded in the order shown below:

- 1. Tilde expansion is performed first.
- 2. Parameter expansion, command substitution, and arithmetic expansion are performed next, from beginning to end.
- 3. Field splitting is then performed on fields generated by step 2, unless the IFS (input field separators) is full.
- 4. Path-name expansion is performed, unless the set -f command is in effect.
- 5. Quote removal is always performed last.

Parameters

Flags Contains a bit flag specifying the configurable aspects of the **wordexp** subroutine.

Pwordexp Contains a pointer to a wordexp_t structure.

Words Specifies the string containing the tokens to be expanded.

The value of the *Flags* parameter is the bitwise, inclusive OR of the constants below, which are defined in the **wordexp.h** file.

WRDE_APPEND Appends words generated to those generated by a previous call to the wordexp subroutine.

WRDE_DOOFFS Makes use of the we_offs structure. If the WRDE_DOOFFS flag is set, the we_offs structure

is used to specify the number of null pointers to add to the beginning of the **we_words** structure. If the **WRDE_DOOFFS** flag is not set in the first call to the **wordexp** subroutine with the *Pwordexp* parameter, it should not be set in subsequent calls to the **wordexp**

subroutine with the *Pwordexp* parameter.

WRDE_NOCMD Fails if command substitution is requested.

WRDE_REUSE The Pwordexp parameter was passed to a previous successful call to the wordexp

subroutine. Therefore, the memory previously allocated may be reused.

WRDE_SHOWERR Does not redirect standard error to /dev/null.

WRDE_UNDEF Reports error on an attempt to expand an undefined shell variable.

The **WRDE_ APPEND** flag can be used to append a new set of words to those generated by a previous call to the **wordexp** subroutine. The following rules apply when two or more calls to the **wordexp** subroutine are made with the same value of the *Pwordexp* parameter and without intervening calls to the **wordfree** subroutine:

- 1. The first such call does not set the WRDE_ APPEND flag. All subsequent calls set it.
- For a single invocation of the wordexp subroutine, all calls either set the WRDE_DOOFFS flag, or do not set it.
- 3. After the second and each subsequent call, the *Pwordexp* parameter points to a list containing the following:
 - a. Zero or more null characters, as specified by the WRDE_DOOFFS flag and the we_offs structure.
 - b. Pointers to the words that were in the *Pwordexp* parameter before the call, in the same order as before.
 - c. Pointers to the new words generated by the latest call, in the specified order.
- 4. The count returned in the *Pwordexp* parameter is the total number of words from all of the calls.
- 5. The application should not modify the *Pwordexp* parameter between the calls.

The **WRDE_NOCMD** flag is provided for applications that, for security or other reasons, want to prevent a user from executing shell commands. Disallowing unquoted shell special characters also prevents unwanted side effects such as executing a command or writing to a file.

Unless the WRDE_SHOWERR flag is set in the Flags parameter, the wordexp subroutine redirects standard error to the /dev/null file for any utilities executed as a result of command substitution while expanding the Words parameter. If the WRDE_SHOWERR flag is set, the wordexp subroutine may write messages to standard error if syntax errors are detected while expanding the Words parameter.

The Pwordexp structure is allocated by the caller, but memory to contain the expanded tokens is allocated by the wordexp subroutine and added to the structure as needed.

The Words parameter cannot contain any <newline> characters, or any of the unquoted shell special characters |, &, ;, (), {}, <, or >, except in the context of command substitution.

Return Values

If no errors are encountered while expanding the Words parameter, the wordexp subroutine returns a value of 0. If an error occurs, it returns a nonzero value indicating the error.

Errors

If the wordexp subroutine terminates due to an error, it returns one of the nonzero constants below, which are defined in the wordexp.h file.

WRDE_BADCHAR One of the unquoted characters |, &, ;, <, >, parenthesis, or braces appears in the Words

parameter in an inappropriate context.

WRDE BADVAL Reference to undefined shell variable when the WRDE_UNDEF flag is set in the Flags

parameter.

WRDE CMDSUB Command substitution requested when the WRDE_NOCMD flag is set in the Flags

parameter.

WRDE_NOSPACE Attempt to allocate memory was unsuccessful.

WRDE_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated string.

If the wordexp subroutine returns the error value WRDE_SPACE, then the expression in the Pwordexp parameter is updated to reflect any words that were successfully expanded. In other cases, the *Pwordexp* parameter is not modified.

Related Information

The **glob** subroutine, **wordfree** ("wordfree Subroutine") subroutine.

For more information on basic and extended regular expressions, see Manipulating Strings with sed.

wordfree Subroutine

Purpose

Frees all memory associated with the *Pwordexp* parameter.

Library

Standard C Library (libc.a)

Syntax

#include <wordexp.h>

void wordfree (Pwordexp) wordexp_t *Pwordexp;

Description

The wordfree subroutine frees any memory associated with the Pwordexp parameter from a previous call to the wordexp subroutine.

Parameters

Pwordexp

Structure containing a list of expanded words.

Related Information

The wordexp ("wordexp Subroutine" on page 580) subroutine.

write, writex, writev, writevx, pwrite, or pwritev Subroutine

Purpose

Writes to a file.

Library

Standard C Library (libc.a)

Syntax

```
#include <unistd.h>
ssize_t write (FileDescriptor, Buffer, NBytes)
int FileDescriptor;
const void * Buffer;
size_t NBytes;
int writex (FileDescriptor, Buffer, NBytes, Extension)
int FileDescriptor;
char *Buffer;
unsigned int NBytes;
int Extension;
ssize t pwrite (FileDescriptor, Buffer, NBytes, Offset)
int FileDescriptor;
const void * Buffer;
size_t NBytes;
off_t Offset;
#include <sys/uio.h>
ssize_t writev (FileDescriptor, iov, iovCount)
int FileDescriptor;
const struct iovec * iov;
int iovCount;
ssize_t writevx (FileDescriptor, iov, iovCount, Extension)
int FileDescriptor;
struct iovec *iov;
int iovCount;
int Extension;
#include <unistd.h>
#include <sys/uio.h>
ssize t pwritev (
int FileDescriptor,
const struct iovec * iov,
int iovCount,
offset t offset);
```

Description

The write subroutine attempts to write the number of bytes of data specified by the NBytes parameter to the file associated with the FileDescriptor parameter from the buffer pointed to by the Buffer parameter.

The writev subroutine performs the same action but gathers the output data from the iovCount buffers specified by the array of **iovec** structures pointed to by the *iov* parameter. Each **iovec** entry specifies the base address and length of an area in memory from which data should be written. The writev subroutine always writes a complete area before proceeding to the next.

The writex and writex subroutines are the same as the write and writex subroutines, respectively, with the addition of an Extension parameter, which is used when writing to some device drivers.

With regular files and devices capable of seeking, the actual writing of data proceeds from the position in the file indicated by the file pointer. Upon return from the write subroutine, the file pointer increments by the number of bytes actually written.

With devices incapable of seeking, writing always takes place starting at the current position. The value of a file pointer associated with such a device is undefined.

If a write requests that more bytes be written than there is room for (for example, the ulimit or the physical end of a medium), only as many bytes as there is room for will be written. For example, suppose there is space for 20 bytes more in a file before reaching a limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes will give a failure return (except as noted below) and the implementation will generate a SIGXFSZ signal for the thread.

Fewer bytes can be written than requested if there is not enough room to satisfy the request. In this case the number of bytes written is returned. The next attempt to write a nonzero number of bytes is unsuccessful (except as noted in the following text). The limit reached can be either that set by the ulimit subroutine or the end of the physical medium.

Successful completion of a write subroutine clears the SetUserID bit (S_ISUID) of a file if all of the following are true:

- · The calling process does not have root user authority.
- The effective user ID of the calling process does not match the user ID of the file.
- The file is executable by the group (S_IXGRP) or other (S_IXOTH).

The write subroutine clears the SetGroupID bit (S_ISGID) if all of the following are true:

- The calling process does not have root user authority.
- · The group ID of the file does not match the effective group ID or one of the supplementary group IDs of the process.
- The file is executable by the owner (S_IXUSR) or others (S_IXOTH).

Note: Clearing of the SetUserID and SetGroupID bits can occur even if the write subroutine is unsuccessful, if file data was modified before the error was detected.

If the O_APPEND flag of the file status is set, the file offset is set to the end of the file prior to each write.

If the FileDescriptor parameter refers to a regular file whose file status flags specify **O SYNC**, this is a synchronous update (as described in the **open** subroutine).

If the FileDescriptor parameter refers to a regular file that a process has opened with the O DEFER file status flag set, the data and file size are not updated on permanent storage until a process issues an fsync subroutine or performs a synchronous update. If all processes that have the file open with the

O DEFER file status flag set close the file before a process issues an fsync subroutine or performs a synchronous update, the data and file size are not updated on permanent storage.

Write requests to a pipe (or first-in-first-out (FIFO)) are handled the same as a regular file with the following exceptions:

- There is no file offset associated with a pipe; hence, each write request appends to the end of the pipe.
- If the size of the write request is less than or equal to the value of the PIPE_BUF system variable (described in the pathconf routine), the write subroutine is guaranteed to be atomic. The data is not interleaved with data from other write processes on the same pipe. Writes of greater than PIPE_BUF bytes can have data interleaved, on arbitrary boundaries, with writes by other processes, whether or not the **O_NDELAY** or **O_NONBLOCK** file status flags are set.
- If the O_NDELAY and O_NONBLOCK file status flags are clear (the default), a write request to a full pipe causes the process to block until enough space becomes available to handle the entire request.
- If the O_NDELAY file status flag is set, a write to a full pipe returns a 0.
- If the O NONBLOCK file status flag is set, a write to a full pipe returns a value of -1 and sets the errno global variable to **EAGAIN**.

When attempting to write to a character special file that supports nonblocking writes and no data can currently be written (streams are an exception described later in this article):

- If the O NDELAY and O NONBLOCK flags are clear (the default), the write subroutine blocks until data can be written.
- If the O_NDELAY flag is set, the write subroutine returns 0.
- If the O NONBLOCK flag is set, the write subroutine returns -1 and sets the errno global variable to **EAGAIN** if no data can be written.

When attempting to write to a regular file that supports enforcement-mode record locks, and all or part of the region to be written is currently locked by another process, the following can occur:

- If the O NDELAY and O NONBLOCK file status flags are clear (the default), the calling process blocks until the lock is released.
- If the O NDELAY or O_NONBLOCK file status flag is set, then the write subroutine returns a value of -1 and sets the errno global variable to EAGAIN.

Note: The **fcntl** subroutine provides more information about record locks.

If fildes refers to a STREAM, the operation of write is determined by the values of the minimum and maximum nbyte range ("packet size") accepted by the STREAM. These values are determined by the topmost STREAM module. If nbyte falls within the packet size range, nbyte bytes will be written. If nbyte does not fall within the range and the minimum packet size value is 0, write will break the buffer into maximum packet size segments prior to sending the data downstream (the last segment may contain less than the maximum packet size). If nbyte does not fall within the range and the minimum value is non-zero, write will fail with errno set to ERANGE. Writing a zero-length buffer (nbyte is 0) to a STREAMS device sends 0 bytes with 0 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no message and 0 is returned. The process may issue I SWROPT ioctl to enable zero-length messages to be sent across the pipe or FIFO.

When writing to a STREAM, data messages are created with a priority band of 0. When writing to a STREAM that is not a pipe or FIFO:

- O NONBLOCK should specify either O NONBLOCK or O NDELAY. The IBM streams implementation treats these two the same.
- If O NONBLOCK or O NDELAY is clear, and the STREAM cannot accept data (the STREAM write queue is full due to internal flow control conditions), write will block until data can be accepted.
- If O NONBLOCK or O NDELAY is set and the STREAM cannot accept data, write will return -1 and set errno to EAGAIN.

• If O NONBLOCK or O NDELAY is set and part of the buffer has been written while a condition in which the STREAM cannot accept additional data occurs, write will terminate and return the number of bytes written.

Note: The IBM streams implementation treats O NONBLOCK and O NDELAY the same.

In addition, write and writev will fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of errno does not reflect the result of write or writev but reflects the prior error.

The writev function is equivalent to write, but gathers the output data from the iovent buffers specified by the members of the iov array: iov[0], iov[1], ..., iov[iovcnt - 1]. iovcnt is valid if greater than 0 and less than or equal to {IOV_MAX}, defined in limits.h.

Each iovec entry specifies the base address and length of an area in memory from which data should be written. The writev function will always write a complete area before proceeding to the next.

If fildes refers to a regular file and all of the iov len members in the array pointed to by iov are 0, writev will return 0 and have no other effect. For other file types, the behavior is unspecified.

If the sum of the iov len values is greater than SSIZE MAX, the operation fails and no data is transferred.

The behavior of an interrupted write subroutine depends on how the handler for the arriving signal was installed. The handler can be installed in one of two ways, with the following results:

- · If the handler was installed with an indication that subroutines should not be restarted, the write subroutine returns a value of -1 and sets the errno global variable to EINTR (even if some data was already written).
- If the handler was installed with an indication that subroutines should be restarted, and:
 - If no data had been written when the interrupt was handled, the write subroutine will not return a value (it is restarted).
 - If data had been written when the interrupt was handled, this write subroutine returns the amount of data already written.

Note: A write to a regular file is not interruptible. Only writes to objects that may block indefinitely, such as FIFOs, sockets, and some devices, are generally interruptible. If fildes refers to a socket, write is equivalent to the send subroutine with no flags set.

The **pwrite** function performs the same action as **write**, except that it writes into a given position without changing the file pointer. The first three arguments to pwrite are the same as write with the addition of a fourth argument offset for the desired position inside the file.

```
Note: The pwrite64 subroutine applies to AIX 4.3 and later.
ssize_t pwrite64(int fd , const void *buf , size_t nbytes , off64_t offset)
```

The pwrite64 subroutine performs the same action as pwrite but the limit of offset to the maximum file size for the file associated with the fileDescriptor and DEV_OFF_MAX if the file associated with fileDescriptor is a block special or character special file.

Using the write or pwrite subroutine with a file descriptor obtained from a call to the shm_open subroutine fails with ENXIO.

The pwritev subroutine performs the same action as the writev subroutine, except that the pwritev subroutine writes to the given position in the file without changing the file pointer. The first three arguments of the **pwritev** subroutine are the same as the **writev** subroutine with an addition of the *offset* argument for the desired position inside the file. An error occurs when the file that the **pwritev** subroutine writes to is incapable of seeking.

Parameters

Buffer Identifies the buffer containing the data to be written.

Extension Provides communication with character device drivers that require additional information

or return additional status. Each driver interprets the Extension parameter in a

device-dependent way, either as a value or as a pointer to a communication area. Drivers

must apply reasonable defaults when the *Extension* parameter value is 0.

FileDescriptor Identifies the object to which the data is to be written.

iov Points to an array of iovec structures, which identifies the buffers containing the data to

be written. The **iovec** structure is defined in the **sys/uio.h** file and contains the following

members:

caddr_t iov_base;
size_t iov_len;

iovCount Specifies the number of iovec structures pointed to by the iov parameter.

NBytes Specifies the number of bytes to write.

offset The position in the file where the writing begins.

Return Values

Upon successful completion, the **write**, **writev**, **writev**, **writev**, and **pwritev** subroutines return the number of bytes that were actually written. The number of bytes written is never greater than the value specified by the *NBytes* parameter. Otherwise, a value of -1 is returned and the **errno** global variable is set to indicate the error.

Error Codes

The write, writev, writevx, and pwritev subroutines are unsuccessful when one of the following is true:

EAGAIN The **O_NONBLOCK** flag is set on this file and the process would be delayed in the write operation; or an

enforcement-mode record lock is outstanding in the portion of the file that is to be written.

EBADF The *FileDescriptor* parameter does not specify a valid file descriptor open for writing.

EDQUOT New disk blocks cannot be allocated for the file because the user or group quota of disk blocks has been

exhausted on the file system.

EFBIG An offset greater than **MAX_FILESIZE** was requested on the 32-bit kernel.

EFAULT The *Buffer* parameter or part of the *iov* parameter points to a location outside of the allocated address

space of the process.

EFBIG An attempt was made to write a file that exceeds the process' file size limit or the maximum file size. If

the user has set the environment variable XPG SUS ENV=ON prior to execution of the process, then

the SIGXFSZ signal is posted to the process when exceeding the process' file size limit.

EINVAL The file position pointer associated with the *FileDescriptor* parameter was negative; the *iovCount*

parameter value was not between 1 and 16, inclusive; or one of the iov_len values in the iov array was

negative.

EINVAL The sum of the iov_len values from a 32-bit application overflowed a 32-bit signed integer in either a

32-bit or a 64-bit kernel environment, or the sum of the iov_len values from a 64-bit application

overflowed a 32-bit signed integer in a 32-bit kernel enviornment.

EINVAL The STREAM or multiplexer referenced by FileDescriptor is linked (directly or indirectly) downstream from

a multiplexer.

EINVAL The value of the *Nbytes* parameter that is larger than OFF_MAX, was requested on the 32-bit kernel.

This is a case where the system call is requested from a 64-bit application that is running on a 32-bit

kernel.

EINTR A signal was caught during the write operation, and the signal handler was installed with an indication

that subroutines are not to be restarted.

EIO An I/O error occurred while writing to the file system; or the process is a member of a background

process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither

ignoring nor blocking SIGTTOU, and the process group has no parent process.

ENOSPC No free space is left on the file system containing the file. **ENXIO** A hangup occurred on the STREAM being written to.

The write or pwrite subroutine was used with a file descriptor obtained from a call to the shm_open

subroutine.

EPIPE An attempt was made to write to a file that is not opened for reading by any process, or to a socket of

type **SOCK_STREAM** that is not connected to a peer socket; or an attempt was made to write to a pipe or FIFO that is not open for reading by any process. If this occurs, a **SIGPIPE** signal will also be sent to

the process.

ERANGE The transfer request size was outside the range supported by the STREAMS file associated with

FileDescriptor.

The write, writev, writevx, and pwritev subroutines might be unsuccessful if the following is true:

ENXIO A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EFBIG An attempt was made to write to a regular file where NBytes greater than zero and the starting offset is

greater than or equal to the offset maximum established in the open file description associated with

FileDescriptor.

EINVAL The **offset** argument is invalid. The value is negative.

ESPIPE *fildes* is associated with a pipe or FIFO.

wstring Subroutine

Purpose

Perform operations on wide character strings.

Library

Standard C Library (libc.a)

Syntax

```
#include <wstring.h>
wchar_t *wstrcat ("wstring Subroutine") (XString1, XString2)
wchar_t *XString1, *XString2;
wchar_t * wstrncat (XString, XString2, Number)
wchar_t *XString1, *XString2;
int Number;
int wstrcmp (XString1, XString2)
```

```
wchar_t *XString1, *XString2;
int wstrncmp (XString1, XString2, Number)
wchar t *XString1, *XString2;
int Number;
wchar_t * wstrcpy (XString1, XString2)
wchar_t *XString1, *XString2;
wchar t * wstrncpy (XString1, XString2, Number)
wchar t *XString1, *XString2;
int Number;
int wstrlen (XString)
wchar t *XString;
wchar t * wstrchr (XString, Number)
wchar_t *XString;
int Number;
wchar_t * wstrrchr (XString, Number)
wchar t *XString;
int Number;
wchar_t * wstrpbrk (XString1, XString2)
wchar_t *XString1, XString2;
int wstrspn (XString1, XString2)
wchar_t *XString1, XString2;
int wstrcspn (XString1, XString2)
wchar_t *XString1, XString2;
wchar_t * wstrtok (XString1, XString2)
wchar_t *XString1, XString2;
wchar_t * wstrdup (XString1)
wchar_t *XString1;
```

Description

The wstring subroutines copy, compare, and append strings in memory, and determine location, size, and existence of strings in memory. For these subroutines, a string is an array of wchar_t characters, terminated by a null character. The wstring subroutines parallel the string subroutines, but operate on strings of type wchar_t rather than on type char, except as specifically noted below.

The parameters XString1, XString2, and XString point to strings of type wchar_t (arrays of wchar characters terminated by a wchar_t null character).

The subroutines wstrcat, wstrncat, wstrcpy, and wstrncpy all alter the XString1 parameter. They do not check for overflow of the array pointed to by XString1. All string movement is performed wide character by wide character. Overlapping moves toward the left work as expected, but overlapping moves to the right may give unexpected results. All of these subroutines are declared in the wstring.h file.

The wstrcat subroutine appends a copy of the wchar_t string pointed to by the XString2 parameter to the end of the wchar t string pointed to by the XString1 parameter. The wstrcat subroutine returns a pointer to the null-terminated result.

The wstrncat subroutine copies, at most, the value of the Number parameter of wchar_t characters in the XString2 parameter to the end of the wchar t string pointed to by the XString1 parameter. Copying stops before Number wchar_t character if a null character is encountered in the string pointed to by the XString2 parameter. The wstrncat subroutine returns a pointer to the null-terminated result.

The wstrcmp subroutine lexicographically compares the wchar_t string pointed to by the XString1 parameter to the wchar_t string pointed to by the XString2 parameter. The wstrcmp subroutine returns a value that is:

- Less than 0 if XString1 is less than XString2
- Equal to 0 if XString1 is equal to XString2
- Greater than 0 if XString1 is greater than XString2

The wstrncmp subroutine makes the same comparison as wstrcmp, but it compares, at most, the value of the Number parameter of pairs of wchar characters. The comparisons are based on collation values as determined by the locale category LC COLLATE and the LANG variable.

The wstrcpy subroutine copies the string pointed to by the XString2 parameter to the array pointed to by the XString1 parameter. Copying stops when the wchar t null is copied. The wstrcpy subroutine returns the value of the XString1 parameter.

The wstrncpy subroutine copies the value of the *Number* parameter of wchar t characters from the string pointed to by the XString2 parameter to the wchar t array pointed to by the XString1 parameter. If XString2 is less than Number wchar_t characters long, then wstrncpy pads XString1 with trailing null characters to fill Number wchar t characters. If XString2 is Number or more wchar t characters long, only the first Number wchar t characters are copied; the result is not terminated with a null character. The **wstrncpy** subroutine returns the value of the *XString1* parameter.

The wstrlen subroutine returns the number of wchar_t characters in the string pointed to by the XString parameter, not including the terminating wchar_t null.

The **wstrchr** subroutine returns a pointer to the first occurrence of the **wchar t** specified by the *Number* parameter in the wchar_t string pointed to by the XString parameter. A null pointer is returned if the wchar t does not occur in the wchar t string. The wchar t null that terminates a string is considered to be part of the wchar_t string.

The wstrrchr subroutine returns a pointer to the last occurrence of the character specified by the Number parameter in the wchar t string pointed to by the XString parameter. A null pointer is returned if the wchar_t does not occur in the wchar_t string. The wchar_t null that terminates a string is considered to be part of the wchar_t string.

The wstrpbrk subroutine returns a pointer to the first occurrence in the wchar t string pointed to by the XString1 parameter of any code point from the string pointed to by the XString2 parameter. A null pointer is returned if no character matches.

The wstrspn subroutine returns the length of the initial segment of the string pointed to by the XString1 parameter that consists entirely of code points from the wchar t string pointed to by the XString2 parameter.

The wstrcspn subroutine returns the length of the initial segment of the wchar t string pointed to by the XString1 parameter that consists entirely of code points not from the wchar t string pointed to by the XString2 parameter.

The wstrtok subroutine returns a pointer to an occurrence of a text token in the string pointed to by the XString1 parameter. The XString2 parameter specifies a set of code points as token delimiters. If the XString1 parameter is anything other than null, then the wstrtok subroutine reads the string pointed to by the XString1 parameter until it finds one of the delimiter code points specified by the XString2 parameter. It then stores a wchar_t null into the wchar_t string, replacing the delimiter code point, and returns a pointer to the first wchar t of the text token. The wstrtok subroutine keeps track of its position in the wchar t string so that subsequent calls with a null XString1 parameter step through the wchar_t string. The delimiters specified by the XString2 parameter can be changed for subsequent calls to wstrtok. When no tokens remain in the wchar_t string pointed to by the XString1 parameter, the wstrtok subroutine returns a null pointer.

The wstrdup subroutine returns a pointer to a wchar_t string that is a duplicate of the wchar_t string to which the XString1 parameter points. Space for the new string is allocated using the malloc subroutine. When a new string cannot be created, a null pointer is returned.

Subroutines, Example Programs, and Libraries in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

wstrtod or watof Subroutine

Purpose

Converts a string to a double-precision floating-point.

Library

Standard C Library

Syntax

#include <wstring.h> double wstrtod (String, Pointer) wchar_t *String, **Pointer; double watof (String) wchar_t *String;

Description

The wstrtod subroutine returns a double-precision floating-point number that is converted from an wchar_t string pointed to by the String parameter. The system searches the String until it finds the first unrecognized character.

The wstrtod subroutine recognizes a string that starts with any number of white-space characters (defined by the iswspace subroutine), followed by an optional sign, a string of decimal digits that may include a decimal point, e or E, an optional sign or space, and an integer.

When the value of Pointer is not (wchar_t **) null, a pointer to the search terminating character is returned to the address indicated by *Pointer*. When the resulting number cannot be created, *Pointer is set to String and 0 (zero) is returned.

The watof (String) subroutine functions like the wstrtod (String (wchar_t **) null).

Parameters

String Specifies the address of the string to scan.

Pointer Specifies the address at which the pointer to the terminating character is stored.

Error Codes

When the value causes overflow, HUGE VAL (defined in the math.h file) is returned with the appropriate sign, and the errno global variable is set to ERANGE. When the value causes underflow, 0 is returned and the errno global variable is set to ERANGE.

Related Information

The atof, atoff, strtod, strtof subroutine, scanf, fscanf, sscanf, fscanf, fscanf, or wsscanf Subroutine" on page 132) subroutine, strtol, strtoul, atol, atol ("strtol, strtoul, strtoll, strtoull, or atol Subroutine" on page 353) subroutine, wstrtol, watol, watol, watol, or watoi Subroutine") subroutine.

Subroutines Overview in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

wstrtol, watol, or watoi Subroutine

Purpose

Converts a string to an integer.

Library

Standard C Library (libc.a)

Syntax

wchar_t *String;

```
#include <wstring.h>
long wstrtol ( String, Pointer, Base)
wchar t *String, **Pointer;
int Base;
long watol (String)
wchar_t *String;
int watoi (String)
```

Description

The wstrtol subroutine returns a long integer that is converted from the string pointed to by the String parameter. The string is searched until a character is found that is inconsistent with Base. Leading white-space characters defined by the ctype subroutine iswspace are ignored.

When the value of Pointer is not (wchar_t **) null, a pointer to the terminating character is returned to the address indicated by Pointer. When an integer cannot be created, the address indicated by Pointer is set to String, and 0 is returned.

When the value of Base is positive and not greater than 36, that value is used as the base during conversion. Leading zeros that follow an optional leading sign are ignored. When the value of Base is 16, 0x and 0X are ignored.

When the value of Base is 0, the system chooses an appropriate base after examining the actual string. An optional sign followed by a leading zero signifies octal, and a leading 0x or 0X signifies hexadecimal. In all other cases, the subroutines assume a decimal base.

Truncation from long data type to int data type occurs by assignment, and also by explicit casting.

The watol (String) subroutine functions like wstrtol (String, (wchar_t **) null, 10).

The watoi (String) subroutine functions like (int) wstrtol (String, (wchar t **) null, 10).

Note: Even if overflow occurs, it is ignored.

Parameters

Specifies the address of the string to scan. Strina

Pointer Specifies the address at which the pointer to the terminating character is stored.

Specifies an integer value used as the base during conversion. Base

void xcrypt randbuff (dest, size)
void *dest;
int size:
```

Description

These subroutines provide block and stream cipher algorithms, plus two crypto-secure hash algorithms. Encryption may be done through the Rijndael, Mars, and Twofish block ciphers or the SEAL stream cipher. Each of these algorithms uses a use a block length of 128 bits and key lengths of 128, 192 and 256 bits. SEAL is a stream cipher that uses a 160 bit key and a 32 bit word input stream. In addition, the MD5 and SHA-1 cryptographic hash algorithms are included.

The **libmodcrypt.a** library and associated headers are available through the Expansion Pack.

The xcrypt_key_setup subroutine is used to setup a key schedule for any of the block cipher algorithms. It stores the key schedule in the xcrypt_key data structure that is passed in. If key scheduling is done for HMAC, set the *dir* parameter of **xcrypt_key_setup** to NULL. Note that when using the Twofish method, the keymat parameter should also be set to NULL. The xcrypt_key_setup subroutine expects the keymat pointer to point to a PKCS#8 object when used with public key encryption. Then the keysize parameter indicates the size of the PCKS#8 object, not the size of the key.

The xcrypt encrypt subroutine encrypts a buffer. Data can be encrypted using the CBC mode (Cipher Block Chaining), EBC mode (Electronic Codebook) or CBF1 mode. Note that when EBC mode is being used, no initalization vector is required.

The xcrypt decrypt subroutine decrypts a buffer. Data can be encrypted using the CBC mode (Cipher Block Chaining), EBC mode (Electronic Codebook) or CBF1 mode. If the xcrypt encrypt subroutine is called with padding on, the xcrypt decrypt subroutine must also be called with padding on. It is the caller's responsibility to determine whether padding is used. Note that when EBC mode is being used, no initalization vector is required.

The **xcrypt hash** subroutine hashes a buffer using either the MD5 or SHA-1 algorithm.

The xcrypt_malloc subroutine dynamically allocates the least size bytes of memory to provide blocks of blocksize bytes. For example, if size is 105 and blocksize is 10, the xcrypt_malloc subroutine will return at least 110 bytes of memory (11 blocks, each 10 bytes in size). The xcrypt_malloc subroutine should be used when you need xcrypt to pad buffers. It will make sure that enough memory is allocated for the data to be encrypted, plus the padding.

The xcrypt_free subroutine overwrites and frees dynamically allocated memory.

The **xcrypt_printb** subroutine prints a buffer to the screen in hexadecimal notation.

The xcrypt mac subroutine provides the caller with a Message Authentication Code (MAC). DES is the only algorithm that is supported.

The xcrypt_hmac subroutine provides the caller with a Hashed Message Authentication Code (HMAC). The algorithm used is MD5 or SHA-1.

The xcrypt_sign subroutine allows the caller to sign data using public key mechanisms.

The **xcrypt_verify** subroutine allows the caller to verify private key signatures.

The xcrypt_dh_keygen subroutine returns the private key object to be used in Diffie Helman key agreement. The dh parameter should point to NULL. The keysize parameter can be KEY_512, KEY_1024, or **KEY 2048**.

The xcrypt_dh subroutine allows the caller to execute the two steps to compute a shared secret through the Diffie-Hellman key agreement algorithm. If in is NULL, then out contains the public shared object to be transmitted to the other party involved in the key agreement. Otherwise, in points to the public shared object received from another party, and out points to the shared private key.

The xcrypt_btoa subroutine returns a string representing the buffer in hexadecimal. Note that the dest parameter must point to a buffer of size * 2 + 1.

The **xcrypt randbuff** subroutine fills a buffer with random data.

Parameters

alg

Specifies the cipher to use. Use the symbolic constants that are described below:

RIJNDAEL

Rijndael (AES) block cipher. Supports key sizes of 128, 192, and 256 bits.

MARS Mars block cipher. Supports key sizes of 128, 192, and 256 bits.

TWOFISH

Twofish block cipher. Supports key sizes of 128, 192, and 256 bits.

SEAL stream cipher. Supports key sizes of 128, 192, and 256 bits. SEAL

SHA1 SHA-1 one-way hash function. Arbitrary lengths are permitted.

MD5 MD5 one-way hash function. Arbitrary lengths are permitted.

DES Data Encryption Standard. Supports key sizes of 64 bits.

TDES Triple Data Encryption Standard. Supports key sizes of 64 and 128 bits.

MAC_DES

Message Authentication Code using the DES algorithm. Supports key sizes of 64

CAST5 CAST encryption algorithm. Supports key sizes of 40, 80, and 128 bits.

RSA Rivest, Shamir Adleman. The keysize passed to xcrypt_key_setup should be the size of the PKCS#8 object.

DSA Digital Signature Algorithm. The keysize passed to xcrypt key setup should be the size of the PKCS#8 object.

kev keymat Points to the key instance to set up. Use for encryption or decryption.

Points to the key material used to build the key schedule.

keysize Size of the keymat parameter. Use the symbolic constants described below:

KEY_64

64 bit key

KEY_80

80 bit key

KEY_128

128 bit key

KEY_192

192 bit key

KEY 256

dir

256 bit key

The direction (encryption or decryption). Use the symbolic constants described below:

DIR_ENCRYPT

Encrypt

DIR_DECRYPT

Decrypt

mode Specifies the mode of operation. Use the symbolic constants described below:

MODE_ECB

Ciphering in ECB mode

MODE_CBC

Ciphering in CBC mode

MODE_CFB1

Ciphering in 1-bit CFB mode

IV Points to the buffer holding the initialization vector.

Note: When using ECB mode, the *IV* parameter should point to NULL.

in Points to the buffer holding the data to encrypt, decrypt, or hash.

insize Contains the size of the in parameter.

mac Points to an output buffer that will hold the MAC.

out Points to a preallocated output buffer.

padding Specifies whether xcrypt should pad the buffers or not. Use the symbolic constants

described below:

TRUE True

FALSE False

pp A double pointer to the destination.

sig Points to an output buffer that holds the RSA signature.

sigsize The size of sig in bytes.

size Contains the amount of memory to allocate, deallocate, print the contents of, or convert to a

string.

blocksize Contains the size of the blocks. Use the symbolic constants described below:

BITS 32

32 bits

BITS 80

80 bits

BITS_128

128 bits

BITS_160

160 bits

BITS 192

192 bits

BITS 256

256 bits

DES BLOCKSIZE

64 bits

Points to the memory to overwrite and free. р buff Points to a buffer to print or convert to a string. dest Points to a preallocated destination buffer.

Refers to the private key object to be passed to xcrypt_dh. The private key object is dh_pk

obtained by calling xcrypt_dh_keygen before calling xcryp.

Return Values

The xcrypt_key_setup, xcrypt_hash and xcrypt_dh_keygen subroutines return 0 on success. The xcrypt malloc subroutine returns the amount of memory allocated on success. The xcrypt encrypt subroutine returns the amount of data encrypted on success. The xcrypt decrypt subroutine returns the amount of data decrypted on success.

Upon success, the xcrypt mac subroutine returns the size of mac in bytes; the xcrypt hmac subroutine returns the size of hashed mac in bytes; the xcrypt_sig subroutine returns the size of signature; and the xcrypt_dh subroutine returns the number of bytes written to out. The xcrypt_verify subroutine returns a value of 1 to indicate successful signal verification.

On failure the above subroutines return the following error codes:

Error Codes

xcrypt_key_setup:

BAD_ALIGN32 A parameter is not aligned on a 32 bit boundary.

BAD_KEY_DIR The *dir* parameter is not valid **BAD_KEY_INSTANCE** The key parameter is not valid

BAD KEY MAT The *keysize* parameter is not valid or the *key* parameter is

corrupt.

xcrypt_encrypt:

BAD ALG The alg parameter is not valid. BAD_CIPHER_MODE The mode parameter is not valid. **BAD CIPHER STATE** The key parameter is not valid.

BAD_INPUT_LEN The insize parameter is not a multiple of of the blocksize

being used by a block cipher for encryption or decryption.

BAD_IV The /V parameter is set to NULL when the mode

parameter is set to MODE_CBC.

BAD_IV_MATThe *IV* parameter is not valid. **BAD_KEY_INSTANCE**The *key* parameter is not valid.

xcrypt_decrypt:

BAD_ALGThe *alg* parameter is not valid. **BAD_CIPHER_MODE**The *mode* parameter is not valid.

BAD_CIPHER_STATE

The key parameter is not valid.

BAD_INPUT_LENThe *insize* parameter is not a multiple of of the *blocksize* being used by a block cipher for encryption or decryption.

The IV parameter is set to NULL when the mode

parameter is set to **MODE_CBC**.
The *IV* parameter is not valid.

BAD_IV_MATThe *IV* parameter is not valid. **BAD_KEY_INSTANCE**The *key* parameter is not valid.

xcrypt_hash:

BAD_IV

BAD_ALG The alg parameter is not valid.

xcrypt_malloc:

BAD MEM ALLOC The system could not allocate size bytes.

yield Subroutine

Purpose

Yields the processor to processes with higher priorities.

Library

Standard C library (libc.a)

Syntax

void yield (void);

Description

The **yield** subroutine forces the current running process or thread to relinquish use of the processor. If the run queue is empty when the **yield** subroutine is called, the calling process or kernel thread is immediately rescheduled. If the calling process has multiple threads, only the calling thread is affected. The process or thread resumes execution after all threads of equal or greater priority are scheduled to run.

Related Information

The getpriority, setpriority, or nice subroutine, setpri ("setpri Subroutine" on page 190) subroutine.

Chapter 2. Curses Subroutines

addch, mvaddch, mvwaddch, or waddch Subroutine

Purpose

Adds a single-byte character and rendition to a window and advances the cursor.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int addch(const chtype ch);
int mvaddch(int y,
int x,
const chtype ch);
int mvwaddch(WINDOW *in,
const chtype ch);
int waddch(WINDOW *win,
const chtype ch);
```

Description

The **addch**, **waddch**, **mvaddch**, and **mvwaddch** subroutines add a character to a window at the logical cursor location. After adding the character, curses advances the position of the cursor one character. At the right margin, an automatic new line is performed.

The **addch** subroutine adds the character to the stdscr at the current logical cursor location. To add a character to a user-defined window, use the **waddch** and **mvwaddch** subroutines. The **mvaddch** and **mvwaddch** subroutines move the logical cursor before adding a character.

If you add a character to the bottom of a scrolling region, curses automatically scrolls the region up one line from the bottom of the scrolling region if **scrollok** is enabled. If the character to add is a tab, new-line, or backspace character, curses moves the cursor appropriately in the window to reflect the addition. Tabs are set at every eighth column. If the character is a new-line, curses first uses the **wcIrtoeol** subroutine to erase the current line from the logical cursor position to the end of the line before moving the cursor.

You can also use the **addch** subroutines to add control characters to a window. Control characters are drawn in the ^X notation.

Adding Video Attributes and Text

Because the *Char* parameter is an integer, not a character, you can combine video attributes with a character by ORing them into the parameter. The video attributes are also set. With this capability you can copy text and video attributes from one location to another using the **inch** ("inch, mvinch, mvwinch, or winch Subroutine" on page 652) and **addch** subroutines.

Parameters

```
ch
y
x
*win
```

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

1. To add the character H represented by variable x to stdscr at the current cursor location, enter:

```
chtype x;
x='H';
addch(x);
```

2. To add the x character to stdscr at the coordinates y = 10, x = 5, enter:

```
mvaddch(10, 5, 'x');
```

3. To add the x character to the user-defined window my window at the coordinates y = 10, x = 5, enter:

```
WINDOW *my window;
mvwaddch(my_window, 10, 5, 'x');
```

4. To add the x character to the user-defined window my_window at the current cursor location, enter:

```
WINDOW *my window;
waddch(my_window, 'x');
```

5. To add the character *x* in standout mode, enter:

```
waddch(my window, 'x' | A STANDOUT);
```

This allows 'x' to be highlighted, but leaves the rest of the window alone.

Related Information

The inch, winch, mvinch, or mvwinch ("inch, mvinch, mvwinch, or winch Subroutine" on page 652) subroutines, wclrtoeol ("clrtoeol or wclrtoeol Subroutine" on page 619) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

addnstr, addstr, mvaddnstr, mvaddstr, mvwaddnstr, mvwaddstr, waddnstr, or waddstr Subroutine

Purpose

Adds a string of multi-byte characters without rendition to a window and advances the cursor.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int addnstr(const char *str,
int n);
int addstr(const char *str);
int mvaddnstr(int y,
int x,
const char *str,
int n);
int mvaddstr(int y,
int x,
const char *str);
```

```
int mvwaddnstr(WINDOW *win,
int y,
int x,
const char *str,
int n);
int mvwaddstr(WINDOW *win,
int y,
int x,
const char *str);
int waddnstr(WINDOW *win,
const char *str,
int n);
int waddstr(WINDOW *win,
const char *str);
```

Description

These subroutines write the characters of the string *str* on the current or specified window starting at the current or specified position using the background rendition.

These subroutines advance the cursor position, perform special character processing, and perform wrapping.

The addstr, mvaddstr, mvwaddstr and waddstr subroutines are similar to calling mbstowcs on str, and then calling addwstr, mvaddwstr, mvwaddwstr, and waddwstr, respectively.

The **addnstr**, **mvaddnstr**, **mvwaddnstr** and **waddnstr** subroutines use at most, *n* bytes from *str*. These subroutines add the entire string when *n* is -1.

Parameters

Column Specifies the horizontal position to move the cursor to before adding the string.

Line Specifies the vertical position to move the cursor to before adding the string.

String Specifies the string to add.

Window Specifies the window to add the string to.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

1. To add the string represented by xyz to the stdscr at the current cursor location, enter:

```
char *xyz;
xyz="Hello!";
addstr(xyz);
```

2. To add the "Hit a Key" string to the stdscr at the coordinates y=10, x=5, enter: mvaddstr(10, 5, "Hit a Key");

- 3. To add the xyz string to the user-defined window my_window at the coordinates y=10, x=5, enter: mvwaddstr(my_window, 10, 5, "xyz");
- 4. To add the xyz string to the user-defined string at the current cursor location, enter: waddstr(my window, "xyz");

Related Information

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

attroff, attron, attrset, wattroff, wattron, or wattrset Subroutine

Purpose

Restricted window attribute control functions.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
int attroff (int *attrs);
int attron (int *attrs);
int attrset (int *attrs);
int wattroff (WINDOW *win, int *attsr);
int wattron (WINDOW *win, int *attrs);
int wattrset (WINDOW *win, int *attsr);
```

Description

These subroutines manipulate the window attributes of the current or specified window.

The attroff and wattroff subroutines turn off attrs in the current or specified specified window without affecting any others.

The attron and wattron subroutines turn on attrs in the current or specified specified window without affecting any others.

The attrset and wattrset subroutines set the background attributes of the current or specified specified window to attrs.

It unspecified whether these subroutines can be used to manipulate attributes than A_BLINK, A_BOLD, A_DIM, A_REVERSE, A_STANDOUT and A_UNDERLINE.

Parameters

*attrs Specifies which attributes to turn off.

*win Specifies the window in which to turn off the specified attributes.

Return Values

These subroutines always return either OK or 1.

Examples

For the attroff or wattroff subroutines:

1. To turn the off underlining attribute in stdscr, enter: attroff(A UNDERLINE);

2. To turn off the underlining attribute in the user-defined window my window, enter: wattroff(my_window, A_UNDERLINE);

For the **attron** or **wattron** subroutines:

- 1. To turn on the underlining attribute in stdscr, enter: attron(A UNDERLINE);
- 2. To turn on the underlining attribute in the user-defined window my window, enter: wattron(my_window, A_UNDERLINE);

For the attrset or wattrset subroutines:

- 1. To set the current attribute in the **stdscr** global variable to blink, enter: attrset(A BLINK);
- 2. To set the current attribute in the user-defined window my window to blinking, enter: wattrset(my_window, A_BLINK);
- 3. To turn off all attributes in the **stdscr** global variable, enter: attrset(0);
- 4. To turn off all attributes in the user-defined window my_window, enter: wattrset(my window, 0);

Setting Video Attributes and Curses Options in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

attron or wattron Subroutine

Purpose

Turns on specified attributes.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

attron(Attributes) char *Attributes;

wattron(Window, Attributes) WINDOW *Window; char *Attributes;

Description

The attron and wattron subroutines turn on specified attributes without affecting any others. The attron subroutine turns the specified attributes on in stdscr. The wattron subroutine turns the specified attributes on in the specified window.

Parameters

Attributes Specifies which attributes to turn on.

Window Specifies the window in which to turn on the specified attributes.

Examples

1. To turn on the underlining attribute in stdscr, enter:

```
attron(A UNDERLINE);
```

2. To turn on the underlining attribute in the user-defined window my window, enter:

```
wattron(my window, A UNDERLINE);
```

attrset or wattrset Subroutine

Purpose

Sets the current attributes of a window to the specified attributes.

Libraries

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
attrset( Attributes)
char *Attributes;
wattrset( Window, Attributes)
WINDOW *Window;
char *Attributes;
```

Description

The attrset and wattrset subroutines set the current attributes of a window to the specified attributes. The attrset subroutine sets the current attribute of stdscr. The wattrset subroutine sets the current attribute of the specified window.

Parameters

Attributes Specifies which attributes to set.

Window Specifies the window in which to set the attributes.

Examples

1. To set the current attribute in the **stdscr** global variable to blink, enter: attrset(A BLINK);

2. To set the current attribute in the user-defined window my_window to blinking, enter: wattrset(my_window, A_BLINK);

3. To turn off all attributes in the **stdscr** global variable, enter: attrset(0);

4. To turn off all attributes in the user-defined window my_window, enter: wattrset(my window, 0);

baudrate Subroutine

Purpose

Gets the terminal baud rate.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

int baudrate(void)

Description

The baudrate subroutine extracts the output speed of the terminal in bits per second.

Return Values

The **baudrate** subroutine returns the output speed of the terminal.

Examples

To guery the baud rate and place the value in the user-defined integer variable BaudRate, enter: BaudRate = baudrate();

Related Information

The tcgetattr ("tcgetattr Subroutine" on page 401) subroutine.

beep Subroutine

Purpose

Sounds the audible alarm on the terminal.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

int beep(void);

Description

The **beep** subroutine alerts the user. It sounds the audible alarm on the terminal, or if that is not possible, it flashes the screen (visible bell). If neither signal is possible, nothing happens.

Return Values

The **beep** subroutine always returns OK.

Examples

To sound an audible alarm, enter:

beep();

Related Information

The flash ("flash Subroutine" on page 635) subroutine.

box Subroutine

Purpose

Draws borders from single-byte characters and renditions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int box(WINDOW *win,
chtype verch,
chtype horch);
```

Description

The box subroutine draws a border around the edges of the specified window. This subroutine does not advance the cursor position. This subroutine does not perform special character processing or perform wrapping.

```
The box subroutine (*win, verch, horch) has an effect equivalent to:
wborder(win, verch, verch, horch, horch, 0, 0, 0, 0);
```

Parameters

horch	Specifies the character to draw the horizontal lines of the box. The character must be a 1-column
	character.
verch	Specifies the character to draw the vertical lines of the box. The character must be a 1-column character.
*win	Specifies the window to draw the box in or around.

Return Values

Upon successful completion, the box function returns OK. Otherwise, it returns ERR.

Examples

1. To draw a box around the user-defined window, my window, using | (pipe) as the vertical character and - (minus sign) as the horizontal character, enter:

```
WINDOW *my window;
box(my window, '|', '-');
```

2. To draw a box around my_window using the default characters ACS_VLINE and ACS_HLINE, enter:

```
WINDOW *my window;
box (my window, 0, 0);
```

can change color, color content, has colors, init_color, init_pair, start_color or pair_content Subroutine

Purpose

Color manipulation functions and external variables for color support.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
bool can_change_color(void);
int color_content(short color,
short *red,
short *green,
short *blue);
int COLOR PAIR(int n);
bool has_colors(void);
int init color
(short color,
short red,
short green,
short blue);
int init pair
(short pair,
short f,
short b);
int pair content
(short pair,
short *f,
short *b);
int PAIR NUMBER
(int value);
int start color
(void);
extern int COLOR_PAIRS;
extern int COLORS;
```

Description

These functions manipulate color on terminals that support color.

Querying Capabilities

The has_colors subroutine indicates whether the terminal is a color terminal. The can_change_color subroutine indicates whether the terminal is a color terminal on which colors can be redefined.

Initialisation

The start_color subroutine must be called in order to enable use of colors and before any color manipulation function is called. This subroutine initializes eight basic colors (black, blue, green, cyan, red, magenta, yellow, and white) that can be specified by the color macros (such as COLOR BLACK) defined in <curses.h>. The initial appearance of these eight colors is not specified.

The function also initialises two global external variables:

- COLORS defines the number of colors that the terminal supports. If COLORS is 0, the terminal does not support redefinition of colors (and can_change_color subroutine will return FALSE).
- COLOR PAIRS defines the maximum number of color-pairs that the terminal supports.

Color Identification

The init_color subroutine redefines color number color, on terminals that support the redefinition of colors, to have the red, green, and blue intensity components specified by red, green, and blue, respectively. Calling init color subroutine also changes all occurrences of the specified color on the screen to the new definition.

The **color content** subroutine identifies the intensity components of color number color. It stores the red, green, and blue intensity components of this color in the addresses pointed to by red, green, and blue, respectively.

For both functions, the color argument must be in the range from 0 to and including COLORS -1. Valid intensity values range from 0 (no intensity component) up to and including 1000 (maximum intensity in that component).

User-Defined Color Pairs

Calling init pair defines or redefines color-pair number pair to have foreground color f and background color b. Calling init pair changes any characters that were displayed in the color pair's old definition to the new definition and refreshes the screen.

After defining the color pair, the macro COLOR_PAIR(n) returns the value of color pair n. This value is the color attribute as it would be extracted from a chtype. Conversely, the macro PAIR_NUMBER(value) returns the color pair number associated with the color attribute value.

The pair_content subroutine retrieves the component colors of a color-pair number pair. It stores the foreground and background color numbers in the variables pointed to by f and b, respectively.

With init pair and pair content subroutines, the value of pair must be in a range from 0 to and including COLOR PAIRS -1. (There may be an implementation-specific upper limit on the valid value of pair, but any such limit is at least 63.) Valid values for f and b are the range from 0 to and including COLORS -1.

The can_change_color subroutine returns TRUE if the terminal supports colors and can change their definitions; otherwise, it returns FALSE.

Parameters

color *red *green *blue pair h value

Return Values

The has_colors subroutine returns TRUE if the terminal can manipulate colors; otherwise, it returns FALSE.

Upon successful completion, the other functions return OK. Otherwise, they return ERR.

Examples

For the **can_change_color** subroutine:

To test whether or not a terminal can change its colors, enter the following and check the return for TRUE or FALSE:

```
can change color();
```

For the color content subroutine:

To obtain the RGB component information for color 10 (assuming the terminal supports at least 11 colors), use:

```
short *r, *g, *b;
color content(10,r,g,b);
```

For the **has_color** subroutine:

To determine whether or not a terminal supports color, use:

```
has colors();
```

For the pair_content subroutine:

To obtain the foreground and background colors for color-pair 5, use:

```
short *f. *b:
pair_content(5,f,b);
```

For this subroutine to succeed, you must have already initialized the color pair. The foreground and background colors will be stored at the locations pointed to by f and b.

For the **start_color** subroutine:

To enable the color support for a terminal that supports color, use:

```
start color();
```

For the init_pair subroutine:

To initialize the color definition for color-pair 2 to a black foreground (color 0) with a cyan background (color 3), use:

```
init pair(2,COLOR BLACK, COLOR CYAN);
```

For the **init color** subroutine:

To initialize the color definition for color 11 to violet on a terminal that supports at least 12 colors, use: init color(11,500,0,500);

Related Information

The attroff ("attroff, attron, attrset, wattroff, wattron, or wattrset Subroutine" on page 604) subroutine.

Curses Overview for Programming and Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

cbreak, nocbreak, noraw, or raw Subroutine

Purpose

Puts the terminal into or out of CBREAK mode.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int cbreak(void);
int nocbreak(void);
int noraw(void);
int raw(void);
```

Description

The cbreak subroutine sets the input mode for the current terminal to cbreak mode and overrides a call to the raw subroutine.

The **nocbreak** subroutine sets the input mode for the current terminal to Cooked Mode without changing the state of the ISIG and IXON flags.

The noraw subroutine sets the input mode for the current terminal to Cooked Mode and sets the ISIG and **IXON** flags.

The **raw** subroutine sets the input mode for the current terminal to Raw Mode.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

For the cbreak and nocbreak subroutines:

- 1. To put the terminal into CBREAK mode, enter: cbreak();
- 2. To take the terminal out of CBREAK mode, enter:

```
nocbreak();
```

3. To place the terminal into raw mode, use:

```
raw();
```

4. To place the terminal out of raw mode, use:

```
noraw();
```

For the **noraw** and **raw** subroutines:

1. To place the terminal into raw mode, use: raw();

```
2. To place the terminal out of raw mode, use:
   noraw();
```

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

clear, erase, wclear or werase Subroutine

Purpose

Clears a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int clear(void);
int erase(void);
int wclear(WINDOW *win);
int werase(WINDOW *win);
```

Description

The clear, erase, wclear, and werase subroutines clear every position in the current or specified window.

The clear and wclear subroutines also achieve the same effect as calling the clearok subroutine, so that the window is cleared completely on the next call to the wrefresh subroutine for the window and is redrawn in its entirety.

Parameters

*win Specifies the window to clear.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

For the clear and wclear subroutines:

- 1. To clear stdscr and set a clear flag for the next call to the **refresh** subroutine, enter: clear();
- 2. To clear the user-defined window my window and set a clear flag for the next call to the wrefresh subroutine, enter:

```
WINDOW *my window;
wclear(my window);
waddstr (my window, "This will be cleared.");
wrefresh (my_window);
```

3. To erase the standard screen structure, enter:

```
erase();
```

4. To erase the user-defined window my window, enter:

```
WINDOW *my window;
werase (my window);
```

Note: After the wrefresh, the window will be cleared completely. You will not see the string "This will be cleared."

For the erase and werase subroutines:

1. To erase the standard screen structure, enter: erase();

2. To erase the user-defined window my window, enter:

```
WINDOW *my window;
werase(my_window);
```

clearok, idlok, leaveok, scrollok, setscrreg or wsetscrreg Subroutine

Purpose

Terminal output control subroutines.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int clearok(WINDOW *win,
bool bf);
int idlok(WINDOW *win,
bool bf);
int leaveok(WINDOW *win,
bool bf);
int scrollok(WINDOW *win,
bool bf);
int setscrreg(int top,
int bot);
```

```
int wsetscrreg(WINDOW *win,
int top,
int bot);
```

Description

These subroutines set options that deal with output within Curses.

The **clearok** subroutine assigns the value of bf to an internal flag in the specified window that governs clearing of the screen during a refresh. If, during a refresh operation on the specified window, the flag in cursor is TRUE or the flag in the specified window is TRUE, then the implementation clears the screen, redraws it in its entirety, and sets the flag to FALSE in curscr and in the specified window. The initial state is unspecified.

The idlok subroutine specifies whether the implementation may use the hardware insert-line, delete-line, and scroll features of terminals so equipped. If bf is TRUE, use of these features is enabled. If bf is FALSE, use of these features is disabled and lines are instead redrawn as required. The initial state is FALSE.

The **leaveok** subroutine controls the cursor position after a refresh operation. If bf is TRUE, refresh operations on the specified window may leave the terminal's cursor at an arbitrary position. If bf is FALSE, then at the end of any refresh operation, the terminal's cursor is positioned at the cursor position contained in the specified window. The initial state is FALSE.

The **scrollok** subroutine controls the use of scrolling. If bf is TRUE, then scrolling is enabled for the specified window, with the consequences discussed in Truncation, Wrapping and Scrolling on page 28. If bf is FALSE, scrolling is disabled for the specified window. The initial state is FALSE.

The **setscrreg** and **wsetscrreg** subroutines define a software scrolling region in the current or specified window. The top and bot arguments are the line numbers of the first and last line defining the scrolling region. (Line 0 is the top line of the window.) If this option and the **scrollok** subroutine are enabled, an attempt to move off the last line of the margin causes all lines in the scrolling region to scroll one line in the direction of the first line. Only characters in the window are scrolled. If a software scrolling region is set and the scrollok subroutine is not enabled, an attempt to move off the last line of the margin does not reposition any lines in the scrolling region.

Parameters

The parameters for the **clearok** subroutine are:

Flag Sets the window clear flag. If TRUE, curses clears the window on the next call to the wrefresh or

refresh subroutines. If FALSE, curses does not clear the window.

Window Specifies the window to clear.

The parameters for the **idlok** subroutine are:

Flaa Specifies whether to enable curses to use the hardware insert/delete line feature (TRUE) or not (FALSE).

Window Specifies the window it will affect.

The parameters for the **leaveok** subroutine are:

Flag Specifies whether to leave the physical cursor alone after a refresh (TRUE) or to move the physical

cursor to the logical cursor after a refresh (FALSE).

Window Specifies the window for which to set the Flag parameter. The parameters for the **scrollok** subroutine are:

Flag Enables scrolling when set to TRUE. Otherwise, set the Flag parameter to FALSE to disable scrolling.

Window Identifies the window in which to enable or disable scrolling.

The parameters for the setscrreg and wsetscrreg subroutines are:

Bmargin Specifies the last line number in the scrolling region.

Tmargin Specifies the first line number in the scrolling region (0 is the top line of the window.).

Window Specifies the window in which to place the scrolling region. You specify this parameter only with the

wsetscrreg subroutine.

Return Values

Upon successful completion, the **setscrreg** and **wsetscrreg** subroutines return OK. Otherwise, they return ERR.

The other subroutines always return OK.

Examples

Examples for the **clearok** subroutine are:

1. To set the user-defined screen my_screen to clear on the next call to the wrefresh subroutine, enter:

```
WINDOW *my_screen;
clearok(my screen, TRUE);
```

2. To set the standard screen structure to clear on the next call to the **refresh** subroutine, enter:

```
clearok(stdscr, TRUE);
```

Examples for the **idlok** subroutine are:

1. To enable curses to use the hardware insert/delete line feature in stdscr, enter:

```
idlok(stdscr, TRUE);
```

2. To force curses not to use the hardware insert/delete line feature in the user-defined window my_window , enter:

```
idlok(my window, FALSE);
```

Examples for the **leaveok** subroutine are:

1. To move the physical cursor to the same location as the logical cursor after refreshing the user-defined window my_window, enter:

```
WINDOW *my_window;
leaveok(my_window, FALSE);
```

2. To leave the physical cursor alone after refreshing the user-defined window my window, enter:

```
WINDOW *my_window;
leaveok(my_window, TRUE);
```

Examples for the **scrollok** subroutine are:

To turn scrolling on in the user-defined window my_window, enter:

```
WINDOW *my_window;
scrollok(my_window, TRUE);
```

2. To turn scrolling off in the user-defined window my window, enter:

```
WINDOW *my_window;
scrollok(my_window, FALSE);
```

Examples for the **setscrreg** or **wsetscrreg** subroutine are:

1. To set a scrolling region starting at the 10th line and ending at the 30th line in the stdscr, enter: setscrreg(9, 29);

Note: Zero is always the first line.

2. To set a scrolling region starting at the 10th line and ending at the 30th line in the user-defined window my window, enter:

```
WINDOW *my_window;
wsetscrreg(my_window, 9, 29);
```

cirtobot or wcirtobot Subroutine

Purpose

Erases the current line from the logical cursor position to the end of the window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int clrtobot(void);
int wclrtobot(WINDOW *win);
```

Description

The **cirtobot** and **wcirtobot** subroutines erase all lines following the cursor in the current or specified window, and erase the current line from the cursor to the end of the line, inclusive. These subroutines do not update the cursor.

Parameters

*win Specifies the window in which to erase lines.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

- 1. To erase the lines below and to the right of the logical cursor in the stdscr, enter: clrtobot();
- To erase the lines below and to the right of the logical cursor in the user-defined window my_window, enter:

```
WINDOW *my_window;
wclrtobot(my_window);
```

Related Information

cirtoeol or wcirtoeol Subroutine

Purpose

Erases the current line from the logical cursor position to the end of the line.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int clrtoeol(void);
int wclrtoeol(WINDOW * win);
```

Description

The **cirtoeol** and **wcirtoeol** subroutines erase the current line from the cursor to the end of the line, inclusive, in the current or specified window. These subroutines do not update the cursor.

Parameters

*win Specifies the window in which to clear the line.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

- 1. To clear the line to the right of the logical cursor in the stdscr, enter: clrtoeol();
- 2. To clear the line to the right of the logical cursor in the user-defined window my window, enter: WINDOW *my window; wclrtoeol(my_window);

color content Subroutine

Purpose

Returns the current intensity of the red, green, and blue (RGB) components of a color.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
color content(Color, R, G,
B)
short Color;
short *R, *G, *B;
```

Description

The color_content subroutine, given a color number, returns the current intensity of its red, green, and blue (RGB) components. This subroutine stores the information in the address specified by the R, G, and B arguments. If successful, this returns OK. Otherwise, this subroutine returns ERR if the color does not exist, is outside the valid range, or the terminal cannot change its color definitions.

To determine if you can change the color definitions for a terminal, use the can_change_color subroutine. You must call the **start_color** subroutine before you can call the **color_content** subroutine.

Note: The values stored at the addresses pointed to by R, G, and B are between 0 (no component) and 1000 (maximum amount of component) inclusive.

Return Values

Indicates the subroutine was successful.

ERR Indicates the color does not exist, is outside the valid range, or the terminal cannot change its color definitions.

Parameters

Points to the address that stores the intensity value of the blue component.

Color Specifies the color number. The color parameter must be a value between 0 and COLORS-1 inclusive.

Points to the address that stores the intensity value of the red component. R

G Points to the address that stores the intensity value of the green component.

Example

To obtain the RGB component information for color 10 (assuming the terminal supports at least 11 colors), use:

```
short *r, *g, *b; color content(10,r,g,b);
```

Related Information

The **start_color** ("start_color Subroutine" on page 714) subroutine.

Curses Overview for Programming, Manipulating Video Attributes,

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

copywin Subroutine

Purpose

Copies a region of a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int copywin(const WINDOW *scrwin,
WINDOW *dstwin,
int sminrow,
int smincol,
int dminrow,
int dmincol,
int dmaxrow,
int dmaxcol,
int overlay);
```

Description

The copywin subroutine provides a finer granularity of control over the overlay and overwrite subroutines. As in the prefresh subroutine, a rectangle is specified in the destination window, (dimrow, dimincol) and (dmaxrow, dmaxcol), and the upper-left-corner coordinates of the source window, (sminrow, smincol). If the overlay subroutine is TRUE, then copying is non-destructive, as in the overlay subroutine. If the **overlay** subroutine is FALSE, then copying is destructive, as in the **overwrite** subroutine.

Parameters

*srcwin	Points to the source window containing the region to copy.
*dstwin	Points to the destination window to copy into.
sminrow	Specifies the upper left row coordinate of the source region.
smincol	Specifies the upper left column coordinate of the source region.
dminrow	Specifies the upper left row coordinate of the destination region.
dmincol	Specifies the upper left column coordinate for the destination region.
dmaxrow	Specifies the lower right row coordinate for the destination region.
dmaxcol	Specifies the lower right column coordinate for the destination region.
overlay	Sets the type of copy. If set to TRUE the copy is nondestructive. Otherwise, if set to FALSE, the copy is destructive.

Return Values

Upon successful completion, the copywin subroutine returns OK. Otherwise, it returns ERR.

Examples

To copy to an area in the destination window defined by coordinates (30,40), (30,49), (39,40), and (39,49) beginning with coordinates (0,0) in the source window, enter the following:

```
WINDOW *srcwin, *dstwin;
copywin(srcwin, dstwin,
0, 0, 30, 40, 39, 49,
TRUE);
```

The example copies ten rows and ten columns from the source window beginning with coordinates (0,0) to the region in the destination window defined by the upper left coordinates (30, 40) and lower right coordinates (39, 49). Because the Overlay parameter is set to TRUE, the copy is nondestructive and blanks from the source window are not copied.

Related Information

The **newpad** ("newpad, pnoutrefresh, prefresh, or subpad Subroutine" on page 670) and **overlay or** overwrite ("overlay or overwrite Subroutine" on page 679) subroutines.

Curses Overview for Programming, Manipulating Window Data with Curses Manipulating Characters with Curses, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs

curs_set Subroutine

Purpose

Sets the cursor visibility.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int curs set(int visibility);
```

Description

The **curs** set subroutine sets the appearance of the cursor based on the value of visibility:

Value of visibility Appearance of Cursor

- 0 invisible
- 1 terminal-specific normal mode
- 2 terminal-specific high visibility mode

The terminal does not necessarily support all the above values.

Parameters

Visibility Sets the cursor state. You can set the cursor state to one of the following:

> 0 Invisible

1 Visible

2 Very visible

Return Values

If the terminal supports the cursor mode specified by visibility, then the cur_set subroutine returns the previous cursor state. Otherwise, the subroutine returns ERR.

Examples

To set the cursor state to invisible, use:

curs set(0);

def_prog_mode, def_shell_mode, reset_prog_mode or reset_shell_mode Subroutine

Purpose

Saves/restores the program or shell terminal modes.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int def prog mode
(void);
int def_shell_mode
(void);
int reset_prog_mode
(void);
int reset shell mode
(void);
```

Description

The def prog_mode subroutine saves the current terminal modes as the "program" (in Curses) state for use by the **reset_prog_mode** subroutine.

The def_shell_mode subroutine saves the current terminal modes as the "shell" (not in Curses) state for use by the reset shell mode subroutine.

The reset_prog_mode subroutine restores the terminal to the "program" (in Curses) state.

The **reset shell mode** subroutine restores the terminal to the "shell" (not in Curses) state.

These subroutines affect the mode of the terminal associated with the current screen.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

For the **def_prog_mode** subroutine:

```
To save the "in curses" state, enter:
def prog mode();
```

For the def_shell_mode subroutine:

```
To save the "out of curses" state, enter:
def_shell_mode();
```

This routine saves the "out of curses" state.

Related Information

def_shell_mode Subroutine

Purpose

Saves the current terminal modes as shell mode ("out of curses").

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
def_shell_mode()
```

Description

The def shell mode subroutine saves the current terminal driver line discipline modes in the current terminal structure for later use by reset_shell_mode(). The def_shell_mode subroutine is called automatically by the **setupterm** subroutine.

This routine would normally not be called except by a library routine.

Example

```
To save the "out of curses" state, enter:
def_shell_mode();
```

This routine saves the "out of curses" state.

Related Information

The **setupterm** ("setupterm Subroutine" on page 702) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

del_curterm, restartterm, set_curterm, or setupterm Subroutine

Purpose

Interfaces to the terminfo database.

Library

Curses Library (libcurses.a)

Syntax

```
#include <term.h>
int del_curterm(TERMINAL *oterm);
int restartterm(char *term.
int fildes,
int *erret);
TERMINAL *set curterm(TERMINAL *nterm);
int setupterm(char *term,
int fildes,
int *erret);
```

Description

The del curterm, restartterm, set curterm, setupterm subroutines retrieve information from the terminfo database.

To gain access to the **terminfo** database, the **setupterm** subroutine must be called first. It is automatically called by the initscr and newterm subroutines. The setupterm subroutine initialises the other subroutines to use the terminfo record for a specified terminal (which depends on whether the use_env subroutine was called). It sets the dur term external variable to a TERMINAL structure that contains the record from the terminfo database for the specified terminal.

The terminal type is the character string term; if term is a null pointer, the environment variable TERM is used. If TERM is not set or if its value is an empty string, the "unknown" is used as the terminal type. The application must set the *fildes* parameter to a file descriptor, open for output, to the terminal device, before calling the **setupterm** subroutine. If the *erret* parameter is not null, the integer it points to is set to one of the following values to report the function outcome:

- -1 The terminfo database was not found (function fails).
- 0 The entry for the terminal was not found in terminfo (function fails).
- 1

A simple call to the **setupterm** subroutine that uses all the defaults and sends the output to stdout is: setupterm(char *)0, fileno(stdout), (int *)0);

The **set_curterm** subroutine sets the variable **cur_term** to *nterm*, and makes all of the terminfo boolean, numeric, and string variables use the values from *nterm*.

The del_curterm subroutine frees the space pointed to by oterm and makes it available for further use. If oterm is the same as cur_term, references to any of the terminfo boolean, numeric, and string variables thereafter may refer to invalid memory locations until the **setupterm** subroutine is called again.

The restartterm subroutine assumes a previous call to the setupterm subroutine (perhaps from the initscr or newterm subroutine). It lets the application specify a different terminal type in term and updates the information returned by the **baudrate** subroutine based on the *fildes* parameter, but does not destroy other information created by the initscr, newterm, or setupterm subroutines.

Parameters

*oterm

*term

fildes

*erret

*nterm

Return Values

Upon successful completion, the set curterm subroutine returns the previous value of cur term. Otherwise, it returns a null pointer.

Upon successful completion, the other subroutines return OK. Otherwise, they return ERR.

Examples

To free the space occupied by a **TERMINAL** structure called my term, use:

```
TERMINAL *my term; del curterm(my term);
```

For the **restartterm** subroutine:

To restart an aixterm after a previous memory save and exit on error with a message, enter: restartterm("aixterm", 1, (int*)0);

```
For the set curterm subroutine:
```

To set the **cur_term** variable to point to the my term terminal, use:

```
TERMINAL *newterm; set_curterm(newterm);
```

For the **setupterm** subroutine:

To determine the current terminal's capabilities using \$TERM as the terminal name, standard output as output, and returning no error codes, enter:

```
setupterm((char*) 0, 1, (int*) 0);
```

Related Information

The baudrate ("baudrate Subroutine" on page 607) subroutine, longname ("longname Subroutine" on page 664) subroutine, putc subroutine, tgetent ("tgetent, tgetflag, tgetnum, tgetstr, or tgoto Subroutine" on page 718) subroutine, tigetflag ("tigetflag, tigetnum, tigetstr, or tparm Subroutine" on page 722) subroutine.

delay_output Subroutine

Purpose

Sets the delay output.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
```

```
int delay output(int ms);
```

Description

On terminals that support pad characters, the **delay_output** subroutine pauses the output for at least ms milliseconds. Otherwise, the length of the delay is unspecified.

Parameters

ms Specifies the number of milliseconds to delay output.

Return Values

Upon successful completion, the delay output subroutine returns OK. Otherwise, it returns ERR.

Examples

To set the output to delay 250 milliseconds, enter: delay output(250);

Related Information

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

delch, mvdelch, mvwdelch or wdelch Subroutine

Purpose

Deletes the character from a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int delch(void);
int mvdelch
(int y
int x);
mvwde1ch
(WINDOW *win;
int y
int x);
wde1ch
(WINDOW *win);
```

Description

The delch, mvdelch, mvdelch, and wdelch subroutines delete the character at the current or specified position in the current or specified window. This subroutine does not change the cursor position.

Parameters

```
Х
*win
         Identifies the window from which to delete the character.
```

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

- 1. To delete the character at the current cursor location in the standard screen structure, enter: mvdelch();
- 2. To delete the character at cursor position y=20 and x=30 in the standard screen structure, enter: mvwdelch(20, 30);
- 3. To delete the character at cursor position y=20 and x=30 in the user-defined window my window, enter:

```
wdelch(my window, 20, 30);
```

Related Information

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

deleteln or wdeleteln Subroutine

Purpose

Deletes lines in a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int deleteln(void);
int wdeleteln(WINDOW *win);
```

Description

The **deleteIn** and **wdeleteIn** subroutines delete the line containing the cursor in the current or specified window and move all lines following the current line one line toward the cursor. The last line of the window is cleared. The cursor position does not change.

Parameters

*win Specifies the window in which to delete the line.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

1. To delete the current line in stdscr, enter:

```
deleteln();
```

2. To delete the current line in the user-defined window my window, enter:

```
WINDOW *my window;
wdeleteln(my_window);
```

Related Information

delwin Subroutine

Purpose

Deletes a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int delwin(WINDOW *win);
```

Description

The **delwin** subroutine deletes win, freeing all memory associated with it. The application must delete subwindows before deleting the main window.

Parameters

*win Specifies the window to delete.

Return Values

Upon successful completion, the delwin subroutine returns OK. Otherwise, it returns ERR.

Examples

```
To delete the user-defined window my window and its subwindow my sub window, enter:
```

```
WINDOW *my sub window, *my window;
delwin(my_sub_window);
delwin(my window);
```

echo or noecho Subroutine

Purpose

Enables/disables terminal echo.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int echo(void);
int noecho(void);
```

Description

The **echo** subroutine enables Echo mode for the current screen. The **noecho** subroutine disables Echo mode for the current screen. Initially, curses software echo mode is enabled and hardware echo mode of the tty driver is disabled. The echo and noecho subroutines control software echo only. Hardware echo must remain disabled for the duration of the application, else the behaviour is undefined.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

```
1. To turn echoing on, use:
   echo();
2. To turn echoing off, use:
   noecho();
```

Related Information

echochar or wechochar Subroutines

Purpose

Echos single-byte character and rendition to a window and refreshes the window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int echochar(const chtype ch);
int wechochar(WINDOW *win,
const chtype ch);
```

Description

The echochar subroutine is equivalent to a call to the addch soubroutine followed by a call to the refresh

The wechochar subroutine is equivalent to a call to the waddch subroutine followed by a call to the wrefresh subroutine.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Example

To output the character I to the stdscr at the present cursor location and to update the physical screen, do the following:

echochar('I');

Related Information

The addch, doupdate, echo wchar, waddch, wmvaddch, and mvaddch ("addch, mvaddch, mvwaddch, or waddch Subroutine" on page 601) subroutines.

Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

endwin Subroutine

Purpose

Suspends curses session.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

int endwin(void)

Description

The endwin subroutine restores the terminal after Curses activity by at least restoring the saved shell terminal mode, flushing any output to the terminal and moving the cursor to the first column of the last line of the screen. Refreshing a window resumes program mode. The application must call the endwin subroutine for each terminal being used before exiting. If the newterm subroutine is called more than once for the same terminal, the first screen created must be the last one for which the endwin subroutine is called.

Return Values

Upon successful completion, the endwin subroutine returns OK. Otherwise, it returns ERR.

Examples

To terminate curses permanently or temporarily, enter: endwin();

Related Information

erase or werase Subroutine

Purpose

Copies blank spaces to every position in a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
erase()
werase( Window)
WINDOW *Window;
```

Description

The erase and werase subroutines copy blank spaces to every position in the specified window. Use the erase subroutine with the stdscr and the werase subroutine with user-defined windows.

Parameters

Window Specifies the window to erase.

Examples

1. To erase the standard screen structure, enter:

```
erase():
```

2. To erase the user-defined window my window, enter:

```
WINDOW *my window;
werase(my_window);
```

Related Information

erasechar, erasewchar, killchar, and killwchar Subroutine

Purpose

Terminal environment query functions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
char erasechar(void);
int erasewchar(wchar t *ch);
char killchar(void);
int killwchar(wchar t
*ch);
```

Description

The erasechar subroutine returns the current character, chosen by the user. The erasechar subroutine stores the current erase character in the object pointed to by the ch parameter. If no erase character has been defined, the subroutine will fail and the object pointed to by ch will not be changed.

The killchar subroutine returns the current line.

The **killchar** subroutine stores the current line kill character in the object pointed to by *ch*. If no line kill character has been defined, the subroutine will fail and the object pointed to by ch will not be changed.

Return Values

The erasechar subroutine returns the erase character and the killchar subroutine returns the line kill character. The return value is unspecified when these characters are multi-byte characters.

Upon successful completion, the erasechar subroutine and the killchar subroutine return OK. Otherwise, they return ERR.

Examples

To retrieve a user's erase character and return it to the user-defined variable myerase, enter: myerase = erasechar();

filter Subroutine

Purpose

Disables use of certain terminal capabilities.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> void filter(void);

Description

The filter subroutine changes the algorithm for initialising terminal capabilities that assume that the terminal has more than one line. A subsequent call to the initscr or newterm subroutine performs the following actions:

- Disables use of clear, cud, cud1, cup, cuu1, and vpa.
- · Sets the value of the home string to the value of the cr. string.
- Sets lines equal to 1.

Any call to the filter subroutine must precede the call to the initscr or newterm subroutine.

Related Information

The initscr ("initscr and newterm Subroutine" on page 655) subroutine, newterm ("newterm Subroutine" on page 672) subroutine.

flash Subroutine

Purpose

Flashes the screen.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

int flash(void);

Description

The flash subroutine alerts the user. It flashes the screen, or if that is not possible, it sounds the audible alarm on the terminal. If neither signal is possible, nothing happens.

Return Values

The **flash** subroutine always returns OK.

Examples

To cause the terminal to flash, enter:

flash();

Related Information

Syntax

#include <curses.h> int flushinp(void);

Description

The flushinp subroutine discards (flushes) any characters in the input buffers associated with the current screen.

Return Values

The **flushinp** subroutine always returns OK.

Examples

To flush all type-ahead characters typed by the user but not yet read by the program, enter: flushinp();

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

garbagedlines Subroutine

Purpose

Discards and replaces a number of lines in a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
```

```
garbagedlines(Window, BegLine, NumLines)
WINDOW * Window;
int BegLine, NumLines;
```

Description

The garbagedlines subroutine discards and replaces lines in a window. The Begline parameter specifies the beginning line number and the Numlines parameter specifies the number of lines to discard. Curses discards and replaces the specified lines before adding more data.

Uses this subroutine for applications that need to redraw a line that is garbled. Lines may become garbled as the result of noisy communication lines. Instead of refreshing the entire display, use the garbagedlines subroutine to refresh a portion of the display and to avoid even more communication noise.

Parameters

Window Points to a window.

BegLine Identifies the beginning line in a range of lines to discard.

NumLines Specifies the total number of lines in a range of lines to discard and replace.

Examples

To discard and replace 5 lines in the mywin window starting with line 10, use:

```
WINDOW *mywin; garbagedlines(mywin, 10, 5);
```

Related Information

getbegyx, getmaxyx, getparyx, or getyx Subroutine

Purpose

Gets the cursor and window coordinates.

Library

Curses Library (libcurses.a)

Syntax

```
include <curses.h>
void getbegyx(WINDOW *win,
int y,
int x);
void getmaxyx(WINDOW *win,
int y,
int x);
void getparyx(WINDOW *win,
int y,
int x);
void getyx(WINDOW *win,
int y,
int x);
```

Description

The **getbegyx** macro stores the absolute screen coordinates of the specified window's origin in y and x.

The **getmaxyx** macro stores the number of rows of the specified window in y and x and stores the window's number of columns in x.

The **getparyx** macro, if the specified window is a subwindow, stores in y and x the coordinates of the window's origin relative to its parent window. Otherwise, -1 is stored in y and x.

The **getyx** macro stores the cursor position of the specified window in y and x.

Parameters

*win Identifies the window to get the coordinates from. Υ Returns the row coordinate.

Χ Returns the column coordinate.

Examples

For the **getbegyx** subroutine:

To obtain the beginning coordinates for the my_win window and store in integers y and x, use:

```
WINDOW *my_win;
int y, x;
getbegyx(my_win, y, x);
```

For the **getmaxyx** subroutine:

To obtain the size of the my_win window, use:

```
WINDOW *my_win;
int y,x;
getmaxyx(my_win, y, x);
```

Integers *y* and *x* will contain the size of the window.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

getch, mvgetch, mvwgetch, or wgetch Subroutine

Purpose

Gets a single-byte character from the terminal.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int getch(void)
int mvgetch(int y,
int x);
int mvwgetch(WINDOW *win,
int y,
int x);
int wgetch(WINDOW *win);
```

Description

The **getch**, **wgetch**, **mvgetch**, and **mvwgetch** subroutines read a single-byte character from the terminal associated with the current or specified window. The results are unspecified if the input is not a single-byte character. If the **keypad** subroutine is enabled, these subroutines respond to the corresponding KEY_value defined in <curses.h>.

Processing of terminal input is subject to the general rules described in Section 3.5 on page 34.

If echoing is enabled, then the character is echoed as though it were provided as an input argument to the **addch** subroutine, except for the following characters:

```
<backspace>,
<left-arrow> and
the current erase character:
```

The input is interpreted as specified in Section 3.4.3 on page 31 and then the character at the resulting cursor position is deleted as though the delch subroutine was called, except that if the cursor was originally in the first column of the line, then the user is alerted as though the beep subroutine was called.

The user is alerted as though the beep subroutine was called. Information concerning the function keys is not returned to the caller.

Function Keys

If the current or specified window is not a pad, and it has been moved or modified since the last refresh operation, then it will be refreshed before another character is read.

The Importance of Terminal Modes

The output of the **getch** subroutines is, in part, determined by the mode of the terminal. The following describes the action of the **getch** subroutines in each type of terminal mode:

Mode **Action of getch Subroutines**

NODELAY Returns a value of ERR if there is no input waiting.

Halts execution until the system passes text through the program. If CBREAK mode is also set, DELAY

the program stops after receiving one character. If NOCBREAK mode is set, the getch

subroutine stops reading after the first new line character.

HALF-DELAY Halts execution until a character is typed or a specified time out is reached. If echo is set, the

character is also echoed to the window.

Note: When using the getch subroutines do not set both the NOCBREAK mode and the ECHO mode at the same time. This can cause undesirable results depending on the state of the tty driver when each character is typed.

Getting Function Keys

If your program enables the keyboard with the **keypad** subroutine, and the user presses a function key, the token for that function key is returned instead of raw characters. The possible function keys are defined in the /usr/include/curses.h file. Each #define macro begins with a KEY prefix.

If a character is received that could be the beginning of a function key (such as an Escape character) curses sets a timer. If the remainder of the sequence is not received before the timer expires, the character is passed through. Otherwise, the function key's value is returned. For this reason, after a user presses the Esc key there is a delay before the escape is returned to the program. Programmers should not use the Esc key for a single character routine.

Within the **getch** subroutine, a structure of type timeval, defined in the **/usr/include/sys/time.h** file. indicates the maximum number of microseconds to wait for the key response to complete.

The ESCDELAY environment variable sets the length of time to wait before timing out and treating the ESC keystroke as the ESC character rather than combining it with other characters in the buffer to create a key sequence. The ESCDELAY environment variable is measured in fifths of a millisecond. If ESCDELAY is 0, the system immediately composes the ESCAPE response without waiting for more information from the buffer. The user may choose any value between 0 and 99,999, inclusive. The default setting for the **ESCDELAY** environment variable is 500 (one tenth of a second).

Programs that do not want the getch subroutines to set a timer can call the notimeout subroutine. If notimeout is set to TRUE, curses does not distinguish between function keys and characters when retrieving data.

The getch subroutines might not be able to return all function keys because they are not defined in the terminfo database or because the terminal does not transmit a unique code when the key is pressed. The following function keys may be returned by the getch subroutines:

KEY_MIN Minimum curses key. **KEY_BREAK** Break key (unreliable). **KEY DOWN** Down Arrow key. KEY_UP Up Arrow key. **KEY_LEFT** Left Arrow key. **KEY_RIGHT** Right Arrow key. KEY_HOME Home key. **KEY BACKSPACE** Backspace.

 $KEY_F(n)$ Function key Fn, where n is an integer from 0 to 64.

KEY_DL Delete line. Insert line. KEY_IL KEY_DC Delete character.

KEY_IC Insert character or enter insert mode.

KEY EIC Exit insert character mode.

KEY_CLEAR Clear screen.

KEY_EOS Clear to end of screen. KEY_EOL Clear to end of line. KEY_SF Scroll 1 line forward.

KEY_SR Scroll 1 line backwards (reverse).

KEY_NPAGE Next page. KEY_PPAGE Previous page. KEY_STAB Set tab. KEY_CTAB Clear tab. KEY_CATAB Clear all tabs.

KEY ENTER Enter or send (unreliable). KEY_SRESET Soft (partial) reset (unreliable). KEY_RESET Reset or hard reset (unreliable).

KEY_PRINT Print or copy.

KEY_LL Home down or bottom (lower left).

KEY_A1 Upper-left key of keypad. KEY_A3 Upper-right key of keypad. KEY_B2 Center-key of keypad. KEY_C1 Lower-left key of keypad. KEY_C3 Lower-right key of keypad.

KEY_BTAB Back tab key. KEY_BEG beg(inning) key KEY_CANCEL cancel key **KEY CLOSE** close key

cmd (command) key KEY_COMMAND

KEY_COPY copy key **KEY_CREATE** create key KEY_END end key **KEY_EXIT** exit key KEY_FIND find key KEY_HELP help key

KEY_MARK mark key **KEY MESSAGE** message key **KEY_MOVE** move key **KEY_NEXT** next object key KEY_OPEN open key **KEY OPTIONS** options key

KEY_PREVIOUS previous object key

KEY_REDO redo key KEY_REFERENCE ref(erence) key KEY_REFRESH refresh key
KEY_REPLACE replace key
KEY_RESTART restart key
KEY_RESUME resume key
KEY_SAVE save key

KEY_SBEG shifted beginning key
KEY_SCANCEL shifted cancel key
KEY_SCOMMAND shifted command key
KEY_SCOPY shifted copy key
KEY_SCREATE shifted create key
KEY_SDC shifted delete char key
KEY_SDL shifted delete line key

KEY_SELECT select key **KEY_SEND** shifted end key KEY_SEOL shifted clear line key KEY_SEXIT shifted exit key KEY_SFIND shifted find key KEY_SHELP shifted help key KEY_SHOME shifted home key KEY_SIC shifted input key KEY_SLEFT shifted left arrow key **KEY_SMESSAGE** shifted message key KEY_SMOVE shifted move key **KEY_SNEXT** shifted next key KEY_SOPTIONS shifted options key KEY_SPREVIOUS shifted prev key shifted print key KEY_SPRINT KEY_SREDO shifted redo key **KEY_SREPLACE** shifted replace key KEY_SRIGHT shifted right arrow KEY_SRSUME shifted resume key KEY_SSAVE shifted save key **KEY_SSUSPEND** shifted suspend key **KEY_SUNDO** shifted undo key **KEY_SUSPEND** suspend key

Parameters

KEY UNDO

Column Specifies the horizontal position to move the logical cursor to before getting the character.

Line Specifies the vertical position to move the logical cursor to before getting the character.

Window Identifies the window to get the character from and echo it into.

undo key

Return Values

Upon successful completion, the **getch**, **mvwgetch**, and **wgetch** subroutines, CURSES, and Curses Interface return the single-byte character, KEY_ value, or ERR. When in the nodelay mode and no data is available, ERR is returned.

Examples

- To get a character and echo it to the stdscr, use: mvgetch();
- 2. To get a character and echo it into stdscr at the coordinates y=20, x=30, use:

```
mvgetch(20, 30);
```

3. To get a character and echo it into the user-defined window my window at coordinates y=20, x=30, use: mvwgetch(my window, 20, 30);

getmaxyx Subroutine

Purpose

Returns the size of a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
getmaxyx( Window, Y, X);
WINDOW *Window;
int Y, X;
```

Description

The getmaxyx subroutine returns the size of a window. The size is returned as the number of rows and columns in the window. The values are stored in integers Y and X.

Parameters

```
Window
            Identifies the window whose size to get.
Y
            Contains the number of rows in the window.
Χ
            Contains the number of columns in the window.
```

Example

To obtain the size of the my win window, use:

```
WINDOW *my win;
int y,x;
getmaxyx(my_win, y, x);
```

Integers y and x will contain the size of the window.

getnstr, getstr, mvgetnstr, mvgetstr, mvwgetnstr, mvwgetstr, wgetnstr, or wgetstr Subroutine

Purpose

Gets a multi-byte character string from the terminal.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int getnstr(char *str,
int n);
int getstr(char *str);
int mvgetnstr(int y,
int x,
char *st,
int n);
int mvgetstr(int y,
int x,
char *str);
int mvwgetnstr(WINDOW *win,
int y,
int x,
char *str,
int n);
int mvwgetstr(WINDOW *win,
int y,
```

```
int x,
char *str);
int wgetnstr(WINDOW *win,
char *str.
int n);
int wgetstr(WINDOW *win,
char *str);
```

The effect of the getstr subroutine is as though a series of calls to the getch subroutine was made, until a newline subroutine, carriage return, or end-of-file is received. The resulting value is placed in the area pointed to by str. The string is then terminated with a null byte. The getnstr, mvgetnstr, mvwgetnstr, and wat most n bytes, thus preventing a possible overflow of the input buffer. The user's erase and kill characters are interpreted, as well as any special keys (such as function keys, home key, clear key, and so on).

The mvgetstr subroutines is identical to the getstr subroutine except that it is as though it is a call to the move subroutine and then a series of calls to the getch subroutine. The mvwgetstr subroutine is identical to the **getstr** subroutine except that it is as though it is a call to the **wmove** subroutine and then a series of calls to the wgetch subroutine.

The mvgetnstr subroutines is identical to the getstr subroutine except that it is as though it is a call to the move subroutine and then a series of calls to the getch subroutine. The mvwgetnstr subroutine is identical to the getstr subroutine except that it is as though it is a call to the wmove subroutine and then a series of calls to the wgetch subroutine.

The getstr, wgetstr, mvgetstr, and mvwgetstr subroutines will only return the entire multi-byte sequence associated with a character. If the array is large enough to contain at least one character, the subroutines fill the array with complete characters. If the array is not large enough to contain any complete characters, the function fails.

Parameters

- Specifies the upper boundary on the number of bytes to read. n
- Holds the column coordinate of the logical cursor. X
- Holds the line or row coordinate of the logical cursor.
- Identifies where to store the string. *str
- *win Identifies the window to get the string from and echo it into.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

1. To get a string, store it in the user-defined variable my string, and echo it into the stdscr, enter:

```
char *my string;
getstr(my string);
```

2. To get a string, echo it into the user-defined window my window, and store it in the user-defined variable my string, enter:

```
WINDOW *my window;
char *my string;
wgetstr(my_window, my_string);
```

3. To get a string in the stdscr at coordinates y=20, x=30, and store it in the user-defined variable my string, enter:

```
char *string;
mvgetstr(20, 30, string);
```

4. To get a string in the user-defined window my window at coordinates y=20, x=30, and store it in the user-defined variable my string, enter:

```
WINDOW *my window;
char *my string;
mvwgetstr(my window, 20, 30, my string);
```

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

getsyx Subroutine

Purpose

Retrieves the current coordinates of the virtual screen cursor.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
getsyx(Y, X)
int * Y, * X;
```

Description

The getsyx subroutine retrieves the current coordinates of the virtual screen cursor and stores them in the location specified by Y and X. The current coordinates are those where the cursor was placed after the last call to the wnoutrefresh, pnoutrefresh, or wrefresh, subroutine. If the leaveok subroutine was TRUE for the last window refreshed, then the **getsyx** subroutine returns -1 for both X and Y.

If lines have been removed from the top of the screen using the **ripoffline** subroutine, Y and X include these lines. Y and X should only be used as arguments for the **setsyx** subroutine.

The getsyx subroutine, along with the setsyx subroutine, is meant to be used by a user-defined function that manipulates curses windows but wants the position of the cursor to remain the same. Such a function would do the following:

- Call the **getsyx** subroutine to obtain the current virtual cursor coordinates.
- · Continue manipulating the windows.
- Call the wnoutrefresh subroutine on each window manipulated.
- Reset the current virtual cursor coordinates to the original values with the setsyx subroutine.
- Refresh the display with a call to the **doupdate** subroutine.

Parameters

- Χ Points to the current row position of the virtual screen cursor. A value of -1 indicates the leaveok subroutine was TRUE for the last window refreshed.
- Points to the current column position of the virtual screen cursor. A value of -1 indicates the leaveok subroutine was TRUE for the last window refreshed.

getyx Macro

Purpose

Returns the coordinates of the logical cursor in the specified window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
getyx (Window, Line, Column)
WINDOW *Window;
int Line, Column;
```

Description

The getyx macro returns the coordinates of the logical cursor in the specified window.

Parameters

```
Window
             Identifies the window to get the cursor location from.
Column
             Holds the column coordinate of the logical cursor.
Line
            Holds the line or row coordinate of the logical cursor.
```

Example

To get the location of the logical cursor in the user-defined window my window and then put these coordinates in the user-defined integer variables Line and Column, enter:

```
WINDOW *my window;
int line, column;
getyx(my_window, line, column);
```

halfdelay Subroutine

Purpose

Controls input character delay mode.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> int halfdelay(int tenths);

Description

The halfdelay subroutine sets the input mode for the current window to Half-Delay Mode and specifies tenths of seconds as the half-delay interval. The tenths argument must be in a range from 1 up to and including 255.

Flag

Instructs wgetch to wait x tenths of a second for input before timing out.

Parameters

tenths

Return Values

Upon successful completion, the halfdelay subroutine returns OK. Otherwise, it returns ERR.

Related Information

The cbreak ("cbreak, nocbreak, noraw, or raw Subroutine" on page 613) subroutine.

has_colors Subroutine

Purpose

Determines whether a terminal supports color.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> has colors()

Description

The has_colors subroutine determines whether a terminal supports color. If the terminal supports color, the has colors subroutine returns TRUE. Otherwise, it returns FALSE. Because this subroutine tests for color, you can call it before the **start color** subroutine.

The has_colors routine makes writing terminal-independent programs easier because you can use the subroutine to determine whether to use color or another video attribute.

Use the can change colors subroutine to determine whether a terminal that supports colors also supports changing its color definitions.

Examples

To determine whether or not a terminal supports color, use: has colors();

Related Information

has_ic and has_il Subroutine

Purpose

Query functions for terminal insert and delete capability.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
bool has_ic(void);
bool has il(void);
```

Description

The has_ic subroutine indicates whether the terminal has insert- and delete-character capabilities.

The has_il subroutine indicates whether the terminal has insert- and delete-line capabilities, or can simulate them using scrolling regions.

Return Values

The **has_ic** subroutine returns a value of TRUE if the terminal has insert- and delete-character capabilities. Otherwise, it returns FALSE.

The **has_il** subroutine returns a value of TRUE if the terminal has insert- and delete-line capabilities. Otherwise, it returns FALSE.

Examples

For the **has_ic** subroutine:

To determine the insert capability of a terminal by returning TRUE or FALSE into the user-defined variable insert_cap, enter:

```
int insert_cap;
insert_cap = has_ic();
```

For the has il subroutine:

To determine the insert capability of a terminal by returning TRUE or FALSE into the user-defined variable insert line, enter:

```
int insert_line;
insert line = has il();
```

Related Information

has il Subroutine

Purpose

Determines whether the terminal has insert-line capability.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
has_il( )
```

Description

The has it subroutine determines whether a terminal has insert-line capability.

Return Values

The has_il subroutine returns TRUE if terminal has insert-line capability and FALSE, if not.

Examples

To determine the insert capability of a terminal by returning TRUE or FALSE into the user-defined variable insert line, enter:

```
int insert line;
insert line = has il();
```

Related Information

idlok Subroutine

Purpose

Allows curses to use the hardware insert/delete line feature.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
idlok( Window, Flag)
WINDOW *Window;
bool Flag;
```

Description

The idlok subroutine enables curses to use the hardware insert/delete line feature for terminals so equipped. If this feature is disabled, curses cannot use it. The insert/delete line feature is always considered. Enable this option only if your application needs the insert/delete line feature; for example, for a screen editor. If the insert/delete line feature cannot be used, curses will redraw the changed portions of all lines that do not match the desired line.

Parameters

Flag Specifies whether to enable curses to use the hardware insert/delete line feature (True) or not (False). Window Specifies the window it will affect.

Examples

- 1. To enable curses to use the hardware insert/delete line feature in stdscr, enter: idlok(stdscr, TRUE);
- 2. To force curses not to use the hardware insert/delete line feature in the user-defined window my window , enter:

```
idlok(my window, FALSE);
```

inch, mvinch, mvwinch, or winch Subroutine

Purpose

Inputs a single-byte character and rendition from a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
chtype inch(void);
chtype mvinch(int y,
int x);
chtype mvwinch(WINDOW *win,
int y,
int x);
chtype winch(WINDOW *win);
```

Description

The **inch**, **winch**, **mvinch**, and **mvwinch** subroutines return the character and rendition, of type chtype, at the current or specified position in the current or specified window.

Parameters

```
*win
         Specifies the window from which to get the character.
У
```

Return Values

Upon successful completion, these subroutines return the specified character and rendition. Otherwise, they return (chtype) ERR.

Examples

1. To get the character at the current cursor location in the stdscr, enter:

```
chtype character;
character = inch();
```

2. To get the character at the current cursor location in the user-defined window my window, enter:

```
WINDOW *my window;
chtype character;
character = winch(my_window);
```

3. To move the cursor to the coordinates y = 0, x = 5 and then get that character, enter:

```
chtype character;
character = mvinch(0, 5);
```

4. To move the cursor to the coordinates y = 0, x = 5 in the user-defined window my window and then get that character, enter:

```
WINDOW *my window;
chtype character;
character = mvwinch(my window, 0, 5);
```

init_color Subroutine

Purpose

Changes a color definition.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
init_color( Color, R,
register short Color, R, G, B;
```

Description

The **init color** subroutine changes a color definition. A single color is defined by the combination of its red, green, and blue components. The init_color subroutine changes all the occurrences of the color on the screen immediately. If the color is changed successfully, this subroutines returns OK. Otherwise, it returns ERR.

Note: The values for the red, green, and blue components must be between 0 (no component) and 1000 (maximum amount of component). The init_color subroutine sets values less than 0 to 0 and values greater than 1000 to 1000.

To determine if you can change a terminal's color definitions, see the can_change_color subroutine.

Return Values

OK Indicates the color was changed successfully.

ERR Indicates the color was not changed.

Parameters

Color Identifies the color to change. The value of the parameter must be between 0 and COLORS-1.

R Specifies the desired intensity of the red component. G Specifies the desired intensity of the green component. В Specifies the desired intensity of the blue component.

Examples

To initialize the color definition for color 11 to violet on a terminal that supports at least 12 colors, use: init color(11,500,0,500);

Related Information

The start_color ("start_color Subroutine" on page 714) subroutine.

Curses Overview for Programming and Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

init_pair Subroutine

Purpose

Changes a color-pair definition.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
init_pair( Pair, F, B)
register short Pair, F, B;
```

Description

The init_pair subroutine changes a color-pair definition. A color pair is a combination of a foreground and a background color. If you specify a color pair that was previously initialized, curses refreshes the screen and changes all occurrences of that color pair to the new definition. You must call the start color subroutine before you call this subroutine.

Return Values

OK Indicates successful completion. ERR Indicates the subroutine failed.

Parameters

Pair Identifies the color-pair number. The value of the Pair parameter must be between 1 and COLORS_PAIRS-1.

Specifies the foreground color number. This number must be between 0 and COLORS-1.

В Specifies the background color number. This number must be between 0 and COLORS-1.

Examples

To initialize the color definition for color-pair 2 to a black foreground (color 0) with a cyan background (color 3), use:

init pair(2,COLOR BLACK, COLOR CYAN);

Related Information

The **init color** ("init color Subroutine" on page 653) subroutine, **start color** ("start color Subroutine" on page 714) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

initscr and newterm Subroutine

Purpose

Initializes curses and its data structures.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
WINDOW *initscr(void);
SCREEN *newterm(char *type,
FILE *outfile,
FILE *infile);
```

Description

The **initscr** subroutine determines the terminal type and initializes all implementation data structures. The TERM environment variable specifies the terminal type. The initscr subroutine also causes the first refresh operation to clear the screen. If errors occur, initscr writes an appropriate error message to standard error and exits. The only subroutines that can be called before initscr or newterm are the filter, ripoffline, slk init, use env, and the subroutines whose prototypes are defined in <term.h>. Portable applications must not call initscr twice.

The **newterm** subroutine can be called as many times as desired to attach a terminal device. The type argument points to a string specifying the terminal type, except that, if type is a null pointer, the TERM environment variable is used. The outfile and infile arguments are file pointers for output to the terminal and input from the terminal, respectively. It is unspecified whether Curses modifies the buffering mode of these file pointers. The newterm subroutine should be called once for each terminal.

```
The initscr subroutine is equivalent to:
newterm(getenv("TERM"), stdout, stdin); return stdscr;
```

If the current disposition for the signals SIGINT, SIGQUIT or SIGTSTP is SIGDFL, then the initscr subroutine may also install a handler for the signal, which may remain in effect for the life of the process or until the process changes the disposition of the signal.

The **initscr** and **newterm** subroutines initialise the cur term external variable.

initscr CURSES Curses Interfaces

Return Values

Upon successful completion, the initscr subroutine returns a pointer to stdscr. Otherwise, it does not return.

Upon successful completion, the **newterm** subroutine returns a pointer to the specified terminal. Otherwise, it returns a null pointer.

Example

To initialize curses so that other curses subroutines can be called, use: initscr():

The **doupdate** ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine, del_curterm ("del_curterm, restartterm, set_curterm, or setupterm Subroutine" on page 625) subroutine, filter ("filter Subroutine" on page 635) subroutine, slk attroff ("slk attroff, slk attr off, slk attron, slk_attrset, slk_attr_set, slk_clear, slk_color, slk_init, slk_label, slk_noutrefresh, slk_refresh, slk_restore, slk set, slk touch, slk wset, Subroutine" on page 704) subroutine, setupterm ("setupterm Subroutine" on page 702) subroutine.

Curses Overview for Programming, Initializing Curses, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

insch, mvinsch, mvwinsch, or winsch Subroutine

Purpose

Inserts a single-byte character and rendition in a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int insch(chtype ch);
int mvinsch(int y,
chtype h);
int mvwinsch(WINDOW *win,
int x,
int y,
chtype h);
int winsch(WINDOW *win,
chtype h);
```

These subroutines insert the character and rendition into the current or specified window at the current or specified position.

These subroutines do not perform wrapping or advance the cursor position. These functions perform special-character processing, with the exception that if a newline is inserted into the last line of a window and scrolling is not enabled, the behavior is unspecified.

Parameters

```
ch
У
Х
         Specifies the window in which to insert the character.
*win
```

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

1. To insert the character x in the stdscr, enter:

```
chtype x;
insch(x);
```

2. To insert the character x into the user-defined window my window, enter:

```
WINDOW *my window
chtype x;
winsch(my_window, x);
```

3. To move the logical cursor to the coordinates Y=10, X=5 prior to inserting the character x in the stdscr, enter:

```
chtype x;
mvinsch(10, 5, x);
```

4. To move the logical cursor to the coordinates y=10, X=5 prior to inserting the character x in the user-defined window my window, enter:

```
WINDOW *my window;
chtype x;
mvwinsch(my window, 10, 5, x);
```

insertIn or winsertIn Subroutine

Purpose

Inserts a blank line above the current line in a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int insertln(void)
int winsertln(WINDOW *win);
```

Description

The insertIn and winsertIn subroutines insert a blank line before the current line in the current or specified window. The bottom line is no longer displayed. The cursor position does not change.

Parameters

*win Specifies the window in which to insert the blank line.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

- 1. To insert a blank line above the current line in the stdscr, enter: insertln();
- 2. To insert a blank line above the current line in the user-defined window my window, enter: WINDOW *mywindow; winsertln(my_window);

Related Information

intrflush Subroutine

Purpose

Enables or disables flush on interrupt.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
int intrflush(WINDOW * win,
bool bf);
```

The intrflush subroutine specifies whether pressing an interrupt key (interrupt, suspend, or quit) will flush the input buffer associated with the current screen. If the value of bf is TRUE, then flushing of the output buffer associated with the current screen will occur when an interrupt key (interrupt, suspend, or quit) is pressed. If the value of bf is FALSE then no flushing of the buffer will occur when an interrupt key is pressed. The default for the option is inherited from the display driver settings. The win argument is ignored.

Parameters

bf

*win Specifies the window for which to enable or disable queue flushing.

Return Values

Upon successful completion, the intrflush subroutine returns OK. Otherwise, it returns ERR.

Examples

- 1. To enable queue flushing in the user-defined window my window, enter: intrflush(my window, TRUE);
- 2. To disable queue flushing in the user-defined window my_window, enter: intrflush(my window, FALSE);

Related Information

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Setting Video Attributes and Curses Options in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

keyname, key_name Subroutine

Purpose

Gets the name of keys.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
char *keyname(int c);
char *key_name(wchar_t c);
```

The **keyname** and **key_name** subroutines generate a character string whose value describes the key c. The c argument of **keyname** can be an 8-bit character or a key code. The c argument of **key_name** must be a wide character.

The string has a format according to the first applicable row in the following table:

Input	Format of Returned String
Visible character	The same character
Control character	^X
Meta-character (keyname only)	M-X
Key value defined in <curses.h> (keyname only)</curses.h>	KEY_name
None of the above	UNKNOWN KEY

The meta-character notation shown above is used only, if meta-characters are enabled.

Parameter

Return Values

Upon successful completion, the keyname subroutine returns a pointer to a string as described above, Otherwise, it returns a null pointer.

Examples

```
int key;
char *name;
keypad(stdscr, TRUE);
addstr("Hit a key");
key=getch();
name=keyname(key);
```

Note: If the Page Up key is pressed, keyname will return KEY_PPAGE.

Related Information

The meta ("meta Subroutine" on page 666) and wgetch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639) subroutines.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

keypad Subroutine

Purpose

Enables or disables abbreviation of function keys.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
int keypad(WINDOW *win,
bool bf);
```

The **keypad** subroutine controls keypad translation. If bf is TRUE, keypad translation is turned on. If bf is FALSE, keypad translation is turned off. The initial state is FALSE.

This subroutine affects the behavior of any function that provides keyboard input.

If the terminal in use requires a command to enable it to transmit distinctive codes when a function key is pressed, then after keypad translation is first enabled, the implemenation transmits this command to the terminal before an affected input function tries to read any characters from that terminal.

Parameters

bf

*win Specifies the window in which to enable or disable the keypad.

Return Values

Upon successful completion, the keypad subroutine returns OK. Otherwise, it returns ERR.

Examples

To turn on the keypad in the user-defined window my window, use:

```
WINDOW *my window;
keypad(my window, TRUE);
```

Related Information

The getch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639) subroutine.

The **terminfo** file format.

Curses Overview for Programming, List of Curses Subroutines, Setting Video Attributes and Curses Options in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

killchar or killwchar Subroutine

Purpose

Terminal environment query functions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
char killchar(void);
int killwchar(wchar_t *ch);
```

Description

The killchar subroutine returns the current line.

The **killchar** subroutine stores the current line kill character in the object pointed to by *ch*. If no line kill character has been defined, the subroutine will fail and the object pointed to by ch will not be changed.

Parameters

*ch

Return Values

The killchar subroutine returns the line kill character. The return value is unspecified when this character is a multi-byte character.

Upon successful completion, the killchar subroutine returns OK. Otherwise, it returns ERR.

Related Information

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

lazySetErrorHandler Subroutine

Purpose

Installs an error handler into the lazy loading runtime system for the current process.

Library

Curses Library (libcurses.a)

Syntax

```
#include <sys/ldr.h>
#include <sys/errno.h>
typedef void *handler t
char *module;
char *symbol;
unsigned int errval;
handler t * lazySetErrorHandler
handler_t *err handler;
```

Description

This function allows a process to install a custom error handler to be called when a lazy loading reference fails to find the required module or function. This function should only be used when the main program or one of its dependent modules was linked with the -blazy option. To call lazySetErrorHandler from a module that is not linked with the -blazy option, you must use the -lrtl option. If you use -blazy, you do not need to specify -Irtl.

This function is not thread safe. The calling program should ensure that _lazySetErrorHandler is not called by multiple threads at the same time.

The user-supplied error handler may print its own error message, provide a substitute function to be used in place of the called function, or call **longimp** subroutine. To provide a substitute function that will be called instead of the originally referenced function, the error handler should return a pointer

Parameters

Column Specifies the horizontal position to move the logical cursor to before getting the character. Line Specifies the vertical position to move the logical cursor to before getting the character.

Window Identifies the window to get the character from and echo it into.

Return Values

Upon completion, the character code for the data key or one of the following values is returned:

KEY XXXX

The keypad subroutine is set to TRUE and a control key was recognized. See the curses. h file for a complete list of the key codes that can be returned.

Examples

1. To get a character and echo it to the stdscr, use: mvgetch();

2. To get a character and echo it into stdscr at the coordinates y=20, x=30, use: mvgetch(20, 30);

3. To get a character and echo it into the user-defined window my window at coordinates y=20, x=30, use: WINDOW *my window; mvwgetch(my window, 20, 30);

Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

leaveok Subroutine

Purpose

Controls physical cursor placement after a call to the **refresh** subroutine.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
leaveok( Window, Flag)
WINDOW *Window;
bool Flag;
```

The leaveok subroutine controls cursor placement after a call to the refresh ("refresh or wrefresh Subroutine" on page 686) subroutine. If the Flag parameter is set to FALSE, curses leaves the physical cursor in the same location as logical cursor when the window is refreshed.

If the Flag parameter is set to TRUE, curses leaves the cursor as is and does not move the physical cursor when the window is refreshed. This option is useful for applications that do not use the cursor, because it reduces physical cursor motions.

By default leaveok is FALSE, and the physical cursor is moved to the same position as the logical cursor after a refresh.

Parameters

Specifies whether to leave the physical cursor alone after a refresh (TRUE) or to move the physical Flag

cursor to the logical cursor after a refresh (FALSE).

Window Identifies the window to set the Flag parameter for.

Return Values

Indicates the subroutine completed. The leaveok subroutine always returns this value.

Examples

1. To move the physical cursor to the same location as the logical cursor after refreshing the user-defined window my window, enter:

```
WINDOW *my window;
leaveok(my window, FALSE);
```

2. To leave the physical cursor alone after refreshing the user-defined window my window, enter:

```
WINDOW *my window;
leaveok(my window, TRUE);
```

Related Information

The **refresh** ("refresh or wrefresh Subroutine" on page 686) subroutine.

Controlling the Cursor with Curses, Curses Overview for Programming, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Iongname Subroutine

Purpose

Returns the verbose name of a terminal.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> char *longname(void);

Description

The **longname** subroutine generates a verbose description for the current terminal. The maximum length of a verbose description is 128 bytes. It is defined only after the call to the initscr or newterm subroutines.

The area is overwritten by each call to the **newterm** subroutine, so the value should be saved if you plan on using the longname subroutine with multiple terminals.

Return Values

Upon successful completion, the longname subroutine returns a pointer to the description specified above. Otherwise, it returns a null pointer on error.

Related Information

The **initscr** ("initscr and newterm Subroutine" on page 655) subroutine, **newterm** ("newterm Subroutine" on page 672) subroutine, setupterm ("setupterm Subroutine" on page 702) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

makenew Subroutine

Purpose

Creates a new window buffer and returns a pointer.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> WINDOW *makenew()

Description

The makenew subroutine creates a new window buffer and returns a pointer to it. The makenew subroutine is called by the newwin subroutine to create the window structure. The makenew subroutine should not be called directly by a program.

Related Information

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

meta Subroutine

Purpose

Enables/disables meta-keys.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int meta(WINDOW *win,
bool bf);
```

Description

Initially, whether the terminal returns 7 or 8 significant bits on input depends on the control mode of the display driver. To force 8 bits to be returned, invoke the meta subroutine (win, TRUE). To force 7 bits to be returned, invoke the **meta** subroutine (win, FALSE). The win argument is always ignored.

If the terminfo capabilities smm (meta_on) and rmm (meta_off) are defined for the terminal, smm is sent to the terminal when meta (win, TRUE) is called and rmm is sent when meta (win, FALSE) is called.

Parameters

```
bf
*win
```

Return Values

Upon successful completion, the meta subroutine returns OK. Otherwise, it returns ERR.

Examples

1. To request an 8-bit character return when using a **getch** routine, enter:

```
WINDOW *some window:
meta(some_window, TRUE);
```

2. To strip the highest bit off the character returns in the user-defined window my window, enter:

```
WINDOW *some window;
meta(some window, FALSE);
```

Related Information

The **getch** ("getch, mvgetch, mvgetch, or wgetch Subroutine" on page 639) subroutine.

Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

move or wmove Subroutine

Purpose

Window location cursor functions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int move (int y, int x);
int wmove (WINDOW *win, int y, int x);
```

Description

The move and wmove subroutines move the logical cursor associated with the current or specified window to (y, x) relative to the window's origin. This subroutine does not move the cursor of the terminal until the next **refresh** ("refresh or wrefresh Subroutine" on page 686) operation.

Parameters

Holds the line or row coordinate of the logical cursor. У Holds the column coordinate of the logical cursor. Χ

*win Identifies the window in which the cursor is being moved.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

- 1. To move the logical cursor in the stdscr to the coordinates y = 5, x = 10, use: move(5, 10);
- 2. To move the logical cursor in the user-defined window my window to the coordinates y = 5, x = 10, use: WINDOW *my window; wmove(my window, 5, 10);

Related Information

The getch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639) and refresh ("refresh or wrefresh Subroutine" on page 686) subroutines.

Controlling the Cursor with Curses, Curses Overview for Programming, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

mycur Subroutine

Purpose

Output cursor movement commands to the terminal.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int mvcur(int oldrow,
int oldcol,
int newrow,
int newcol);
```

Description

The **mvcur** subroutine outputs one or more commands to the terminal that move the terminal's cursor to (newrow, newcol), an absolute position on the terminal screen. The (oldrow, oldcol) arguments specify the former cursor position. Specifying the former position is necessary on terminals that do not provide coordinate-based movement commands. On terminals that provide these commands, Curses may select a more efficient way to move the cursor based on the former position. If (newrow, newcol) is not a valid address for the terminal in use, the mvcur subroutine fails. If (oldrow, oldcol) is the same as (newrow, newcol), mvcur succeeds without taking any action. If mvcur outputs a cursor movement command, it updates its information concerning the location of the cursor on the terminal.

Parameters

newcol Holds the new column coordinate of the physical cursor. Holds the new row coordinate of the physical cursor. newrow oldcol Holds the old column coordinate of the physical cursor. oldrow Holds the old row coordinate of the physical cursor.

Return Values

Upon successful completion, the **mvcur** subroutine returns OK. Otherwise, it returns ERR.

Examples

- 1. To move the physical cursor from the coordinates y = 5, x = 15 to y = 25, x = 30, use: mvcur(5, 15, 25, 30);
- 2. To move the physical cursor from unknown coordinates to y = 5, x = 0, use: mvcur(50, 50, 5, 0);

In this example, the physical cursor's current coordinates are unknown. Therefore, arbitrary values are assigned to the OldLine and OldColumn parameters and the desired coordinates are assigned to the NewLine and NewColumn parameters. This is called an absolute move.

Related Information

Controlling the Cursor with Curses, Curses Overview for Programming, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

mywin Subroutine

Purpose

Moves a window or subwindow to the specified coordinates.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int mvwin
(WINDOW *win,
int y,
int x);
```

Description

The **mvwin** subroutine moves the specified window so that its origin is at position (y, x). If the move causes any portion of the window to extend past any edge of the screen, the function fails and the window is not moved.

Parameters

```
*win
x
y
```

Return Values

Upon successful completion, the mvwin subroutine returns OK. Otherwise, it returns ERR.

Examples

1. To move the user-defined window my_window from its present location to the upper left corner of the terminal, enter:

```
WINDOW *my_window;
mvwin(my_window, 0, 0);
```

2. To move the user-defined window my_window from its present location to the coordinates y = 20, x = 10, enter:

```
WINDOW *my_window;
mvwin(my_window, 20, 10);
```

Manipulating Window Data with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

newpad, pnoutrefresh, prefresh, or subpad Subroutine

Purpose

Pad management functions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
WINDOW *newpad
(int nlines,
int ncols);
int
pnoutrefresh
(WINDOW *pad,
int pminrow,
int pmincol,
int sminrow,
int smincol,
int smaxrorw,
int smaxcol);
int
prefresh
(WINDOW *pad,
int pminrow,
int pmincol,
int sminrow,
int smincol,
int smaxrorw.
int smaxcol);
WINDOW
*subpad
(WINDOW *orig,
int nlines,
int ncols.
int begin_y,
int begin x);
```

Description

The **newpad** subroutine creates a specialised WINDOW data structure with *nlines* lines and *ncols* columns. A pad is similar to a window, except that it is not associated with a viewable part of the screen. Automatic refreshes of pads do not occur.

The **subpad** subroutine creates a subwindow within a pad with n*lines* lines and ncols columns. Unlike the subwin subroutine, which uses screen coordinates, the window is at a position (begin_y, begin_x) on the pad. The window is made in the middle of the window *orig*, so that changes made to one window affects both windows.

The prefresh ("prefresh or pnoutrefresh Subroutine" on page 681) or pnoutrefresh ("prefresh or pnoutrefresh Subroutine" on page 681) subroutines are analogous to the wrefresh and wnoutrefresh subroutines except that they relate to pads instead of windows. The additional arguments indicate what part of the pad and screen are involved. The pminrow and pmincol arguments specify the origin of the rectangle to be displayed in the screen. The lower right-hand corner of the rectangle to be displayed in the pad is calculated from the screen coordinates, since the rectangles must be the same size. Both

rectangles must be entirely contained within their respective structures. Negative values of pminrow, pmincol, sminrow or smincol are treated as if they were zero.

Parameters

ncols nlines begin_x begin_y *orig *pad pminrow pmincol sminrow smincol smaxrorw smaxcol

Return Values

Upon successful completion, the **newpad** and **subpad** subroutines return a pointer to the pad structure. Otherwise, they return a null pointer.

Upon successful completion, the pnoutrefresh and prefresh subroutines return OK. Otherwise, they return ERR.

Examples

For the **newpad** subroutine:

1. To create a new pad and save the pointer to it in my pad, enter:

```
WINDOW *my_pad;
my pad = newpad(5, 10);
my pad is now a pad 5 lines deep, 10 columns wide.
```

2. To create a pad and save the pointer to it in my_pad, which is flush with the right side of the terminal, enter:

```
WINDOW *my pad;
my pad = newpad(5, 0);
my pad is now a pad 5 lines deep, extending to the far right side of the terminal.
```

3. To create a pad and save the pointer to it in my pad, which fills the entire terminal, enter:

```
WINDOW *my_pad;
my pad = newpad(0, 0);
my pad is now a pad that fills the entire terminal.
```

4. To create a very large pad and display part of it on the screen, enter;

```
WINDOW *my_pad;
my pal = newpad(120, 120);
prefresh (my_pal, 0,0,0,0,20,30);
```

This causes the first 21 rows and first 31 columns of the pad to be displayed on the screen. The upper left coordinates of the resulting rectangle are (0,0) and the bottom right coordinates are (20,30).

For the **prefresh** or **pnoutrefresh** subroutines:

 To update the user-defined my_pad pad from the upper-left corner of the pad on the terminal with the upper-left corner at the coordinates Y=20, X=10 and the lower-right corner at the coordinates Y=30, X=25 enter

```
WINDOW *my_pad;
prefresh(my pad, 0, 0, 20, 10, 30, 25);
```

2. To update the user-defined my_pad1 and my_pad2 pads and output them both to the terminal in one burst of output, enter:

```
WINDOW *my_pad1; *my_pad2;
pnoutrefresh(my_pad1, 0, 0, 20, 10, 30, 25);
pnoutrefresh(my_pad2, 0, 0, 0, 0, 10, 5);
doupdate();
```

For the **subpad** subroutine:

To create a subpad, use:

```
WINDOW *orig, *mypad;
orig = newpad(100, 200);
mypad = subpad(orig, 30, 5, 25, 180);
```

The parent pad is 100 lines by 200 columns. The subpad is 30 lines by 5 columns and starts in line 25, column 180 of the parent pad.

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Windows in the Curses Environment in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

newterm Subroutine

Purpose

Initializes curses and its data structures for a specified terminal.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>

SCREEN *newterm(
    Type,
    OutFile, InFile)
char *Type;
FILE *OutFile, *InFile;
```

The newterm subroutine initializes curses and its data structures for a specified terminal. Use this subroutine instead of the initscr subroutine if you are writing a program that sends output to more than one terminal. You should also use this subroutine if your program requires indication of error conditions so that it can run in a line-oriented mode on terminals that do not support a screen-oriented program.

If you are directing your program's output to more than one terminal, you must call the newterm subroutine once for each terminal. You must also call the endwin subroutine for each terminal to stop curses and restore the terminal to its previous state.

Parameters

InFile Identifies the input device file. OutFile Identifies the output device file.

Type Specifies the type of output terminal. This parameter is the same as the \$TERM environment variable

for that terminal.

Return Values

The newterm subroutine returns a variable of type SCREEN *. You should save this reference to the terminal within your program.

Examples

1. To initialize curses on a terminal represented by the lft device file as both the input and output terminal, open the device file with the following:

```
fdfile = fopen("/dev/lft0", "r+");
```

Then, use the **newterm** subroutine to initialize curses on the terminal and save the new terminal in the my terminal variable as follows:

```
char termname [] = "terminaltype";
SCREEN *my_terminal;
my terminal = newterm(termname, fdfile, fdfile);
```

2. To open the device file /dev/1ft0 as the input terminal and the /dev/tty0 (an ibm3151) as the output terminal, do the following:

```
fdifile = fopen("/dev/lft0", "r");
fdofile = fopen("/dev/tty0", "w");
SCREEN *my terminal2;
my terminal2 = newterm("ibm3151", fdofile, fdifile);
```

3. To use stdin for input and stdout for output, do the following:

```
char termname [] = "terminaltype";
SCREEN *my terminal;
my terminal = newterm(termname, stdout, stdin);
```

Related Information

The **endwin** ("endwin Subroutine" on page 632) subroutine, **initscr** ("initscr and newterm Subroutine" on page 655) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Initializing Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

derwin, newwin, or subwin Subroutine

Purpose

Window creation subroutines.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
WINDOW *derwin(WINDOW *orig,
int nlines,
int ncols,
int begin y
int begin x);
WINDOW *newwin(int nlines,
int ncols,
int begin y,
int begin_x);
WINDOW *subwin(WINDOW *orig,
int nlines,
int ncols,
int begin_y
int begin_x);
```

Description

The **derwin** subroutine is the same as the **subwin** subroutine except that *begin_y* and *begin_x* are relative to the origin of the window *orig* rather than absolute screen positions.

The **newwin** subroutine creates a new window with *nlines* lines and *ncols* columns, positioned so that the origin is at (begin_y, begin_x). If nlines is zero, it defaults to LINES - begin_y, if ncols is zero, it defaults to COLS - begin x.

The **subwin** subroutine creates a new window with *nlines* lines and *ncols* columns, positioned so that the origin is at (begin_y, begin_x). (This position is an absolute screen position, not a position relative to the window orig.) If any part of the new window is outside orig, the subroutine fails and the window is not created.

Parameters

ncols nlines begin_y begin_x

Return Values

Upon successful completion, these subroutines return a pointer to the new window. Otherwise, they return a null pointer.

Examples

For the **derwin** and **newwin** subroutines:

1. To create a new window, enter:

```
WINDOW *my window;
my window = newwin(5, 10, 20, 30);
```

my window is now a window 5 lines deep, 10 columns wide, starting at the coordinates y = 20, x = 30. That is, the upper left corner is at coordinates y = 20, x = 30, and the lower right corner is at coordinates y = 24, x = 39.

2. To create a window that is flush with the right side of the terminal, enter:

```
WINDOW *my window;
my window = newwin(5, 0, 20, 30);
```

my window is now a window 5 lines deep, extending all the way to the right side of the terminal, starting at the coordinates y = 20, x = 30. The upper left corner is at coordinates y = 20, x = 30, and the lower right corner is at coordinates y = 24, x = lastcolumn.

3. To create a window that fills the entire terminal, enter:

```
WINDOW *my window;
my\_window = newwin(0, 0, 0, 0);
```

my window is now a screen that is a window that fills the entire terminal's display.

For the **subwin** subroutine:

1. To create a subwindow, use:

```
WINDOW *my window, *my sub window;
my_window = newwin ("derwin, newwin, or subwin Subroutine" on page 674)
            (5, 10, 20, 30);
```

my sub window is now a subwindow 2 lines deep, 5 columns wide, starting at the same coordinates of its parent window my window. That is, the subwindow's upper-left corner is at coordinates y = 20, x =30 and lower-right corner is at coordinates y = 21, x = 34.

2. To create a subwindow that is flush with the right side of its parent, use

```
WINDOW *my_window, *my_sub_window;
my window =
newwin ("derwin, newwin, or subwin Subroutine" on page 674)(5, 10, 20, 30);
my sub window = subwin(my window, 2, 0, 20, 30);
```

my sub window is now a subwindow 2 lines deep, extending all the way to the right side of its parent window my window, and starting at the same coordinates. That is, the subwindow's upper-left corner is at coordinates y = 20, x = 30 and lower-right corner is at coordinates y = 21, x = 39.

3. To create a subwindow in the lower-right corner of its parent, use:

```
WINDOW *my window, *my sub window
my window = newwwin ("derwin, newwin, or subwin Subroutine" on page 674)
            (5, 10, 20, 30);
my sub window = subwin(my window, 0, 0, 22, 35);
```

my sub window is now a subwindow that fills the bottom right corner of its parent window, my window, starting at the coordinates y = 22, x = 35. That is, the subwindow's upper-left corner is at coordinates y = 22, x = 35 and lower-right corner is at coordinates y = 24, x = 39.

Related Information

The endwin ("endwin Subroutine" on page 632), initscr ("initscr and newterm Subroutine" on page 655) subroutines.

Curses Overview for Programming, List of Curses Subroutines, Windows in the Curses Environment in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

nl or nonl Subroutine

Purpose

Enables/disables newline translation.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> int nl(void); int nonl(void);

Description

The nl subroutine enables a mode in which carriage return is translated to newline on input. The nonnl subroutine disables the above translation. Initially, the above translation is enabled.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

- 1. To instruct **wgetch** to translate the carriage return into a newline, enter:
- 2. To instruct wgetch not to translate the carriage return, enter: nonl();

Related Information

The refresh ("refresh or wrefresh Subroutine" on page 686) subroutine, waddch ("addch, mvaddch, mvwaddch, or waddch Subroutine" on page 601) subroutine.

Curses Overview for Programming, Understanding Terminals with Curses, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

nodelay Subroutine

Purpose

Enables or disables block during read.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int nodelay(WINDOW *win,
bool bf);
```

Description

The nodelay subroutine specifies whether Delay Mode or No Delay Mode is in effect for the screen associated with the specified window. If bf is TRUE, this screen is set to No Delay Mode. If bf is FALSE, this screen is set to Delay Mode. The initial state is FALSE.

Parameters

```
hf
*win
```

Return Values

Upon successful completion, the **nodelay** subroutine returns OK. Otherwise, it returns ERR.

Examples

1. To cause the wgetch subroutine to return an error message, if no input is ready in the user-defined window my window, use:

```
nodelay(my_window, TRUE);
```

2. To allow for a delay when retrieving a character in the user-defined window my window, use:

```
WINDOW *my window;
nodelay(my_window, FALSE);
```

Related Information

The halfdelay ("halfdelay Subroutine" on page 648) subroutine, wgetch, ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs

notimeout, timeout, wtimeout Subroutine

Purpose

Controls blocking on input.

Library

Curses Library (libcurses.a)

Curses Syntax

```
#include <curses.h>
int notimeout
(WINDOW *win,
bool bf);
```

```
void timeout
(int delay);
void wtimeout
(WINDOW *win,
int delay);
```

The notimeout subroutine specifies whether Timeout Mode or No Timeout Mode is in effect for the screen associated with the specified window. If bf is TRUE, this screen is set to No Timeout Mode. If bf is FALSE, this screen is set to Timeout Mode. The initial state is FALSE.

The timeout and wtimeout subroutines set blocking or non-blocking read for the current or specified window based on the value of delay:

delay < 0	One or more blocking reads (indefinite waits for input) are used.
delay = 0	One or more non-blocking reads are used. Any Curses input subroutine will fail if every
	character of the requested string is not immediately available.
delay > 0	Any Curses input subroutine blocks for delay milliseconds and fails if there is still no input.

Parameters

*win bf

Return Values

Upon successful completion, the notimeout subroutine returns OK. Otherwise, it returns ERR.

The **timeout** and **wtimeout** subroutines do not return a value.

Examples

To set the flag so that the wgetch subroutine does not set the timer when getting characters from the my win window, use:

```
WINDOW *my win;
notimeout (my win, TRUE);
```

Related Information

The getch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639), halfdelay ("halfdelay Subroutine" on page 648), nodelay ("nodelay Subroutine" on page 676), and notimeout ("notimeout, timeout, wtimeout Subroutine" on page 677) subroutines.

Getting Characters in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

overlay or overwrite Subroutine

Purpose

Copies one window on top of another.

Library

Curses Library (libcurses.a)

Syntax

```
WINDOW *dstwin);
int overwrite(const WINDOW *srcwin,
WINDOW *dstwin);
```

Description

The **overlay** and **overwrite** subroutines overlay *srcwin* on top of *dstwin*. The *scrwin* and *dstwin* arguments need not be the same size; only text where the two windows overlap is copied.

The overwrite subroutine copies characters as though a sequence of win wch and wadd wch subroutines were performed with the destination window's attributes and background attributes cleared.

The **overlay** subroutine does the same thing, except that, whenever a character to be copied is the background character of the source window. the overlay subroutine does not copy the character but merely moves the destination cursor the width of the source background character.

If any portion of the overlaying window border is not the first column of a multi-column character then all the column positions will be replaced with the background character and rendition before the overlay is done. If the default background character is a multi-column character when this occurs, then these subroutines fail.

Parameters

srcwin deswin

Return Values

Upon successful completion. these subroutines return OK. Otherwise, they return ERR.

Examples

```
1. To copy my window on top of other window, excluding spaces, use:
```

```
WINDOW *my window, *other window;
overlay(my window, other window);
```

2. To copy my window on top of other window, including spaces, use:

```
WINDOW *my window, *other window;
overwrite(my window, other window);
```

Related Information

The **copywin** ("copywin Subroutine" on page 621) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Window Data with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

pair_content Subroutine

Purpose

Returns the colors in a color pair.

Library

Curses Library (libcurses.a)

Curses Syntax

```
#include <curses.h>
pair_content ( Pair, F, B)
short Pair;
short *F, *B;
```

Description

The **pair_content** subroutine returns the colors in a color pair. A color pair is made up of a foreground and background color. You must call the **start_color** subroutine before calling the **pair_content** subroutine.

Note: The color pair must already be initialized before calling the pair_content subroutine.

Return Values

OK Indicates the subroutine completed successfully.

ERR Indicates the pair has not been initialized.

Parameters

Pair Identifies the color-pair number. The Pair parameter must be between 1 and COLORS_PAIRS-1.

F Points to the address where the foreground color will be stored. The F parameter will be between **0** and **COLORS-1**.

Points to the address where the background color will be stored. The *B* parameter will be between **0** and **COLORS-1**.

Example

В

To obtain the foreground and background colors for color-pair 5, use:

```
short *f, *b;
pair_content(5,f,b);
```

For this subroutine to succeed, you must have already initialized the color pair. The foreground and background colors will be stored at the locations pointed to by f and b.

Related Information

The **start_color** ("start_color Subroutine" on page 714) subroutine, **init_pair** ("init_pair Subroutine" on page 654) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes, Working with Color in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

prefresh or pnoutrefresh Subroutine

Purpose

Updates the terminal and curscr (current screen) to reflect changes made to a pad.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
prefresh(Pad, PY, PX, TTY, TTX, TBY, TBX)
WINDOW * Pad;
int PY, PX, TTY;
int TTX, TBY, TBX;
pnoutrefresh (Pad, PY, PX, TTY, TTX, TBY, TBX)
WINDOW *Pad;
int PY, PX, TTY;
int TTX, TBY, TBX;
```

Description

The prefresh and pnoutrefresh subroutines are similar to the wrefresh ("refresh or wrefresh Subroutine" on page 686) and wnoutrefresh ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutines. They are different in that pads, instead of windows, are involved, and additional parameters are necessary to indicate what part of the pad and screen are involved.

The PX and PY parameters specify the upper left corner, in the pad, of the rectangle to be displayed. The TTX, TTY, TBX, and TBY parameters specify the edges, on the screen, for the rectangle to be displayed in. The lower right corner of the rectangle to be displayed is calculated from the screen coordinates, since both rectangle and pad must be the same size. Both rectangles must be entirely contained within their respective structures.

The **prefresh** subroutine copies the specified portion of the pad to the physical screen. if you wish to output several pads at once, call pnoutrefresh for each pad and then issue one call to doupdate. This updates the physical screen once.

Parameters

- Pad Specifies the pad to be refreshed.
- PX(Pad's x-coordinate) Specifies the upper-left column coordinate, in the pad, of the rectangle to be displayed.
- PΥ (Pad's y-coordinate) Specifies the upper-left row coordinate, in the pad, of the rectangle to be displayed.
- TBX (Terminal's Bottom x-coordinate) Specifies the lower-right column coordinate, on the terminal, for the pad to be displayed in.
- TBY (Terminal's Bottom y-coordinate) Specifies the lower-right row coordinate, on the terminal, for the pad to be displayed in.
- TTX (Terminal's Top x-coordinate) Specifies the upper-left column coordinate, on the terminal, for the pad to be displayed in.
- (Terminal's Top Y coordinate) Specifies the upper-left row coordinate, on the terminal, for the pad to be displayed in.

Examples

1. To update the user-defined my pad pad from the upper-left corner of the pad on the terminal with the upper-left corner at the coordinates Y=20, X=10 and the lower-right corner at the coordinates Y=30, X=25 enter

```
WINDOW *my pad;
prefresh(my_pad, 0, 0, 20, 10, 30, 25);
```

2. To update the user-defined my pad1 and my pad2 pads and output them both to the terminal in one burst of output, enter:

```
WINDOW *my_pad1; *my_pad2; pnoutrefresh(my_pad1, 0, 0, 20, 10, 30, 25);
pnoutrefresh(my pad2, 0, 0, 0, 0, 10, 5);
doupdate();
```

Related Information

Manipulating Window Data with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

printw, wprintw, mvprintw, or mvwprintw Subroutine

Purpose

Performs a printf command on a window using the specified format control string.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
printw( Format, [ Argument ...])
char *Format, *Argument;
wprintw( Window, Format, [Argument ...])
WINDOW *Window;
char *Format, *Argument;
mvprintw( Line, Column, Format, [Argument ...])
int Line, Column;
char *Format, *Argument;
mvwprintw(Window, Line, Column, Format, [Argument ...])
WINDOW *Window;
int Line, Column;
char *Format, *Argument;
```

Description

The **printw**, wprintw, mvprintw, and mvwprintw subroutines perform output on a window by using the specified format control string. However, the waddch ("addch, mvaddch, mvwaddch, or waddch

Subroutine" on page 601) subroutine is used to output characters in a given window instead of invoking the **printf** subroutine. The **mvprintw** and **mvwprintw** subroutines move the logical cursor before performing the output.

Use the **printw** and **mvprintw** subroutines on the stdscr and the **wprintw** and **mvwprintw** subroutines on user-defined windows.

Note: The maximum length of the format control string after expansion is 512 bytes.

Parameters

Argument Specifies the item to print. See the **printf** subroutine for more details. Specifies the horizontal position to move the cursor to before printing.

Format Specifies the format for printing the Argument parameter. See the **printf** subroutine.

Line Specifies the vertical position to move the cursor to before printing.

Window Specifies the window to print into.

Examples

1. To print the user-defined integer variables x and y as decimal integers in the stdscr, enter:

```
int x, y;
printw("%d%d", x, y);
```

2. To print the user-defined integer variables x and y as decimal integers in the user-defined window my window, enter:

```
int x, y;
WINDOW *my_window;
wprintw(my_window, "%d%d", x, y);
```

3. To move the logical cursor to the coordinates y = 5, x = 10 before printing the user-defined integer variables x and y as decimal integers in the stdscr, enter:

```
int x, y;
mvprintw(5, 10, "%d%d", x, y);
```

4. To move the logical cursor to the coordinates y = 5, x = 10 before printing the user-defined integer variables x and y as decimal integers in the user-defined window my window, enter:

```
int x, y;
WINDOW *my_window;
mvwprintw(my_window, 5, 10, "%d%d", x, y);
```

Related Information

The **waddch** ("addch, mvaddch, mvwaddch, or waddch Subroutine" on page 601) subroutine, **printf** subroutine.

The **printf** command.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in *AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.*

putp, tputs Subroutine

Purpose

Outputs commands to the terminal.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int putp(const char *str);
int tputs(const char *str,
int affcnt,
int (*putfunc)(int));
```

Description

These subroutines output commands contained in the terminfo database to the terminal.

The putp subroutine is equivalent to tputs(str, 1, putchar). The output of the putp subroutine always goes to stdout, not to the fildes specified in the setupterm subroutine.

The **tputs** subroutine outputs *str* to the terminal. The *str* argument must be a terminfo string variable or the return value from the tgetstr, tgoto, tigestr, or tparm subroutines. The affcnt argument is the number of lines affected, or 1 if not applicable. If the terminfo database indicates that the terminal in use requires padding after any command in the generated string, the tputs subroutine inserts pad characters into the string that is sent to the terminal, at positions indicated by the terminfo database. The tputs subroutine outputs each character of the generated string by calling the user-supplied putfunc subroutine (see below).

The user-supplied **putfunc** subroutine (specified as an argument to the **tputs** subroutine is either **putchar** or some other subroutine with the same prototype. The tputs subroutine ignores the return value of the putfunc subroutine.

Parameters

```
*str
affcnt
*putfunc
```

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

putp(my_string);

For the **putp** subroutine:

```
To call the tputs(my string, 1, putchar) subroutine, enter:
char *my string;
```

For the **tputs** subroutine:

1. To output the clear screen sequence using the user-defined putchar-like subroutine my_putchar, enter:

```
int my putchar();
tputs(clear screen, 1 ,my putchar);
```

2. To output the escape sequence used to move the cursor to the coordinates x=40, y=18 through the user-defined putchar-like subroutine my putchar, enter:

```
int my putchar();
tputs(tparm(cursor address, 18, 40), 1, my putchar);
```

Related Information

The doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine, is_linetouched ("is_linetouched, is_wintouched, touchline, touchwin, untouchwin, or wtouchin Subroutine" on page 726) subroutine, putchar subroutine, tgetent ("tgetent, tgetflag, tgetnum, tgetstr, or tgoto Subroutine" on page 718) subroutine, tigetflag ("tigetflag, tigetnum, tigetstr, or tparm Subroutine" on page 722) subroutine, **tputs** ("putp, tputs Subroutine" on page 683) subroutine.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

raw or noraw Subroutine

Purpose

Places the terminal into or out of raw mode.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> raw() noraw()

Description

The raw or noraw subroutine places the terminal into or out of raw mode, respectively. RAW mode is similar to CBREAK mode (cbreak or nocbreak ("cbreak, nocbreak, noraw, or raw Subroutine" on page 613) subroutine). In RAW mode, the system immediately passes typed characters to the user program. The interrupt, quit, and suspend characters are passed uninterrupted, instead of generating a signal. RAW mode also causes 8-bit input and output.

To get character-at-a-time input without echoing, call the cbreak and noecho subroutines. Most interactive screen-oriented programs require this sort of input.

Return Values

Indicates the subroutine completed. The raw and noraw routines always return this value.

Examples

- 1. To place the terminal into raw mode, use:
- 2. To place the terminal out of raw mode, use: noraw();

Related Information

The getch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639) subroutine, cbreak or nocbreak ("cbreak, nocbreak, noraw, or raw Subroutine" on page 613) subroutine

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

refresh or wrefresh Subroutine

Purpose

Updates the terminal's display and the cursor to reflect changes made to a window.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> refresh()

wrefresh(Window) WINDOW *Window;

Description

The refresh or wrefresh subroutines update the terminal and the cursor to reflect changes made to a window. The refresh subroutine updates the stdscr. The wrefresh subroutine refreshes a user-defined window.

Other subroutines manipulate windows but do not update the terminal's physical display to reflect their changes. Use the refresh or wrefresh subroutines to update a terminal's display after internal window representations change. Both subroutines check for possible scroll errors at display time.

Note: The physical terminal cursor remains at the location of the window's cursor during a refresh, unless the **leaveok** ("leaveok Subroutine" on page 663) subroutine is enabled.

The refresh and wrefresh subroutines call two other subroutines to perform the refresh operation. First, the wnoutrefresh ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine copies the designated window structure to the terminal. Then, the doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine updates the terminal's display and the cursor.

Parameters

Window Specifies the window to refresh.

Examples

- 1. To update the terminal's display and the current screen structure to reflect changes made to the standard screen structure, use:
 - refresh();
- 2. To update the terminal and the current screen structure to reflect changes made to a user-defined window called my window, use:

```
WINDOW *my window;
wrefresh(my window);
```

3. To restore the terminal to its state at the last refresh, use:

```
wrefresh(curscr);
```

This subroutine is useful if the terminal becomes garbled for any reason.

Related Information

The **doupdate** ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine, leaveok ("leaveok Subroutine" on page 663) subroutine, wnoutrefresh ("leaveok Subroutine" on page 663) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

reset_prog_mode Subroutine

Purpose

Restores the terminal to program mode.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> reset_prog_mode()

Description

The **reset_prog_mode** subroutine restores the terminal to program or *in curses* mode.

The reset_prog_mode subroutine is a low-level routine and normally would not be called directly by a program.

Related Information

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

reset shell mode Subroutine

Purpose

Restores the terminal to shell mode.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> reset shell mode()

Description

The reset_shell_mode subroutine restores the terminal into shell, or "out of curses," mode. This happens automatically when the endwin subroutine is called.

Related Information

The **endwin** ("endwin Subroutine" on page 632) subroutine.

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

resetterm Subroutine

Purpose

Resets terminal modes to what they were when the saveterm subroutine was last called.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> resetterm()

Description

The **resetterm** subroutine resets terminal modes to what they were when the **saveterm** subroutine was last called.

The **resetterm** subroutine is called by the **endwin** ("endwin Subroutine" on page 632) subroutine, and should normally not be called directly by a program.

Related Information

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

resetty, savetty Subroutine

Purpose

Saves/restores the terminal mode.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int resetty(void);
int savetty(void):
```

Description

The **resetty** subroutine restores the program mode as of the most recent call to the **savetty** subroutine.

The savetty subroutine saves the state that would be put in place by a call to the reset_prog_mode subroutine.

Return Values

Upon successful completion, these subroutines return OK. Otherwise. they return ERR.

Examples

To restore the terminal to the state it was in at the last call to savetty, enter: resetty();

Related Information

The def_prog_mode ("def_prog_mode, def_shell_mode, reset_prog_mode or reset_shell_mode Subroutine" on page 623) subroutine, endwin ("endwin Subroutine" on page 632) subroutine, savetty ("savetty Subroutine" on page 691) subroutine.

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

restartterm Subroutine

Purpose

Re-initializes the terminal structures after a restore.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
#include <term.h>
restartterm ( Term, FileNumber, ErrorCode)
char *Term;
int FileNumber:
int *ErrorCode;
```

Description

The **restartterm** subroutine is similar to the **setupterm** subroutine except that it is called after restoring memory to a previous state. For example, you would call the **restartterm** subroutine after a call to scr_restore if the terminal type has changed. The restartterm subroutine assumes that the windows and the input and output options are the same as when memory was saved, but the terminal type and baud rate may be different.

Parameters

Term Specifies the terminal name to obtain the terminal for. If 0 is passed for the parameter, the value

of the \$TERM environment variable is used.

FileNumber Specifies the output file's file descriptor (1 equals standard out).

ErrorCode Specifies a pointer to an integer to return the error code to. If 0, then the restartterm subroutine

exits with an error message instead of returning.

Example

To restart an aixterm after a previous memory save and exit on error with a message, enter:

restartterm("aixterm", 1, (int*)0);

Prerequisite Information

Curses Overview for Programming and Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs .

Related Information

The **setupterm** ("setupterm Subroutine" on page 702) subroutine.

ripoffline Subroutine

Purpose

Reserves a line for a dedicated purpose.

Library

Curses Library (libcurses.a)

Syntax

```
#include
<curses.h>
ripoffline(int line,
int (*init)(WINDOW *win,
int columns));
```

The **ripoffline** subroutine reserves a screen line for use by the application.

Any call to the **ripoffline** subroutine must precede the call to the **initscr** or **newterm** subroutine. If line is positive, one line is removed from the beginning of stdstr; if line is negative, one line is removed from the end. Removal occurs during the subsequent call to the initscr or newterm subroutine. When the subsequent call is made, the subroutine pointed to by init is called with two arguments: a WINDOW pointer to the one-line window that has been allocated and an integer with the number of columns in the window. The initialisation subroutine cannot use the LINES and COLS external variables and cannot call the wrefresh or doupdate subroutine, but may call the wnoutrefresh subroutine.

Up to five lines can be ripped off. Calls to the ripoffline subroutine above this limit have no effect, but report success.

Parameters

line *init columns *win

Return Values

The **ripoffline** subroutine returns OK.

Example

To remove three lines from the top of the screen, enter:

```
#include <curses.h>
ripoffline(1, initfunc);
ripoffline(1, initfunc);
ripoffline(1, initfunc);
initscr();
```

Related Information

The doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine, slk_attroff, slk_init ("slk_attroff, slk_attr_off, slk_attron, slk_attrset, slk_attr_set, slk_clear, slk_color, slk_init, slk_label, slk_noutrefresh, slk_refresh, slk_restore, slk_set, slk_touch, slk_wset, Subroutine" on page 704) subroutine, **initscr** ("initscr and newterm Subroutine" on page 655) subroutine, **newterm** ("newterm Subroutine" on page 672) subroutine.

Curses Overview for Programming and List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

savetty Subroutine

Purpose

Saves the state of the tty modes.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> savetty()

Description

The savetty subroutine saves the current state of the tty modes in a buffer. It saves the current state in a buffer that the **resetty** subroutine then reads to reset the tty state.

The savetty subroutine is called by the initscr subroutine and normally should not be called directly by the program.

Related Information

The initscr ("initscr and newterm Subroutine" on page 655) subroutine, resetty ("resetty, savetty Subroutine" on page 689) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scanw, wscanw, mvscanw, or mvwscanw Subroutine

Purpose

Calls the wgetstr subroutine on a window and uses the resulting line as input for a scan.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
scanw( Format, Argument1, Argument2, ...)
char *Format, *Argument1, ...;
wscanw(Window, Format, Argument1, Argument2, ...)
WINDOW *Window;
char *Format, *Argument1, ...;
mvscanw( Line, Column, Format, Argument1, Argument2, ...)
int Line, Column;
char *Format, *Argument1, ...;
mvwscanw(Window, Line, Column, Format, Argument1, Argument2, ...)
WINDOW *Window;
int Line, Column;
char *Format, *Argument1, ...;
```

Description

The scanw, wscanw, mvscanw, and mvwscanw subroutines call the wgetstr subroutine on a window and use the resulting line as input for a scan. The mvscanw and mvwscanw subroutines move the cursor before performing the scan function. Use the scanw and mvscanw subroutines on the stdscr and the wscanw and mvwscanw subroutines on the user-defined window.

Parameters

Argument Specifies the input to read.

Column Specifies the vertical coordinate to move the logical cursor to before performing the scan.

Format Specifies the conversion specifications to use to interpret the input. For more information about this

parameter, see the discussion of the Format parameter in the scanf ("scanf, fscanf, sscanf, or

wsscanf Subroutine" on page 132) subroutine.

Line Specifies the horizontal coordinate to move the logical cursor to before performing the scan.

Window Specifies the window to perform the scan in. You only need to specify this parameter with the

wscanw and mvwscanw subroutines.

Example

The following shows how to read input from the keyboard using the **scanw** subroutine.

```
int id;
char deptname[25];

mvprintw(5,0,"Enter your i.d. followed by the department name:\n");
refresh();
scanw("%d %s", &id, deptname);
mvprintw(7,0,"i.d.: %d, Name: %s\n", id, deptname);
refresh();
```

Related Information

The **wgetstr** ("getnstr, getstr, mvgetnstr, mvwgetnstr, mvwgetstr, wgetnstr, or wgetstr Subroutine" on page 644) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scr_dump, scr_init, scr_restore, scr_set Subroutine

Purpose

File input/output functions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int scr_dump
(const char *filename);
int scr_init
(const char *filename);
int scr_restore
(const char *filename);
int scr_set
(const char *filename);
```

Description

The **scr_dump** subroutine writes the current contents of the virtual screen to the file named by *filename* in an unspecified format.

The scr restore subroutine sets the virtual screen to the contents of the file named by filename, which must have been written using the scr dump subroutine. The next refresh operation restores the screen to the way it looked in the dump file.

The scr_init subroutine reads the contents of the file named by filename and uses them to initialize the Curses data structures to what the terminal currently has on its screen. The next refresh operation bases any updates of this information, unless either of the following conditions is true:

- The terminal has been written to since the virtual screen was dumped to filename.
- The terminfo capabilities rmcup and nrrmc are defined for the current terminal.

The scr set subroutine is a combination of scr restore and scr init subroutines. It tells the program that the information i the file named by filename is what is currently on the screen, and also what the program wants on the screen. This can be thought of as a screen inheritance function.

Parameters

filename

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

For the **scr_dump** subroutine:

To write the contents of the virtual screen to /tmp/virtual.dump file, use: scr_dump("/tmp/virtual.dump");

For the **scr_restrore** subroutine:

To restore the contents of the virtual screen from the /tmp/virtual.dump file and update the terminal screen, use:

```
scr restore("/tmp/virtual.dump");
doupdate();
```

Curses Overview for Programming, Manipulating Window Data with Curses, Understanding Terminals with Curses and List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scr init Subroutine

Purpose

Initializes the curses data structures from a dump file.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

scr init(Filename) char *Filename;

Description

The scr_init subroutine initializes the curses data structures from a dump file. You create dump files with the scr_dump subroutine. If the file's data is valid, the next screen update is based on the contents of the file rather than clearing the screen and starting from scratch. The data is invalid if the terminfo database boolean capability **nrrmc** is TRUE or the contents of the terminal differ from the contents of the dump file.

Note: If nrrmc is TRUE, avoid calling the putp subroutine with the exit ca mode value before calling **scr init** subroutine in your application.

You can call the scr_init subroutine after the initscr subroutine to update the screen with the dump file contents. Using the keypad, meta, slk clear, curs set, flash, and beep subroutines do not affect the contents of the screen, but cause the terminal's modification time to change.

You can allow more than one process to share screen dumps. Both processes must be run from the same terminal. The scr_init subroutine first ensures that the process that created the dump is in sync with the current terminal data. If the modification time of the terminal is not the same as that specified in the dump file, the scr init subroutine assumes that the screen image on the terminal has changed from that in the file, and the file's data is invalid.

If you are allowing two processes to share a screen dump, it is important to understand that one process starts up another process. The following activities happen:

- The second process creates the dump file with the scr_init subroutine.
- The second process exits without causing the terminal's time stamp to change by calling the endwin subroutine followed by the scr_dump subroutine, and then the exit subroutine.
- Control is passed back to the first process.
- The first process calls the **scr_init** subroutine to update the screen contents with the dump file data.

Return Values

ERR Indicates the dump file's time stamp is old or the boolean capability nrrmc is TRUE.

Indicates that the curses data structures were successfully initialized using the contents of the dump file.

Parameters

Filename Points to a dump file.

Related Information

The **scr dump** ("scr dump, scr init, scr restore, scr set Subroutine" on page 693) subroutine, **scr_restore** ("scr_restore Subroutine" on page 696) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Window Data with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scr_restore Subroutine

Purpose

Restores the virtual screen from a dump file.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
scr restore( FileName)
char *FileName;
```

Description

The scr_restore subroutine restores the virtual screen from the contents of a dump file. You create a dump file with the scr dump subroutine. To update the terminal's display with the restored virtual screen, call the wrefresh or doupdate subroutine after restoring from a dump file.

To communicate the screen image across processes, use the scr_restore subroutine along with the scr_dump subroutine.

Return Values

ERR Indicates the content of the dump file is incompatible with the current release of curses.

OK Indicates that the virtual screen was successfully restored from a dump file.

Parameters

FileName Identifies the name of the dump file.

Example

To restore the contents of the virtual screen from the /tmp/virtual.dump file and update the terminal screen, use:

```
scr restore("/tmp/virtual.dump");
doupdate();
```

Related Information

The scr dump ("scr dump, scr init, scr restore, scr set Subroutine" on page 693) subroutine, scr init ("scr_init Subroutine" on page 694) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scrl, scroll, wscrl Subroutine

Purpose

Scrolls a Curses window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int scrl
(int n);
int scroll
(WINDOW *win);
int wscrl
(WINDOW *win,
int n);
```

Description

The scroll subroutine scrolls win one line in the direction of the first line

The **scrl** and **wscrl** subroutines scroll the current or specified window. If *n* is positive, the window scrolls *n* lines toward the first line. Otherwise, the window scrolls -n lines toward the last line.

Theses subroutines do not change the cursor position. If scrolling is disabled for the current or specified window, these subroutines have no effect. The interaction of these subroutines with the setscereg subroutine is currently unspecified.

Parameters

```
*win
         Specifies the window to scroll.
```

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

```
To scroll the user-defined window my_window up one line, enter:
```

```
WINDOW *my window;
scroll(my window);
```

Related Information

The scrollok ("scrollok Subroutine") subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

scrollok Subroutine

Purpose

Enables or disables scrolling.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
scrollok( Window, Flag)
WINDOW *Window;
bool Flag;
```

Description

The **scrollok** subroutine enables or disables scrolling. Scrolling occurs when a program or user:

- Moves the cursor off the window's bottom edge.
- Enters a new-line character on the last line.
- Types the last character of the last line.

If enabled, curses calls a refresh as part of the scrolling action on both the window and the physical display. To get the physical scrolling effect on the terminal, it is also necessary to call the idlok ("idlok Subroutine" on page 651) subroutine.

If scrolling is disabled, the cursor is left on the bottom line at the location where the character was entered.

Parameters

Flag Enables scrolling when set to TRUE. Otherwise, set the Flag parameter to FALSE to disable scrolling. Window Identifies the window to enable or disable scrolling in.

Examples

1. To turn scrolling on in the user-defined window my window, enter:

```
WINDOW *my window;
scrollok(my window, TRUE);
```

2. To turn scrolling off in the user-defined window my window, enter:

```
WINDOW *my window;
scrollok(my window, FALSE);
```

Related Information

The **idlok** ("idlok Subroutine" on page 651) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

set_curterm Subroutine

Purpose

Sets the current terminal variable to the specified terminal.

Library

Curses Library (libcurses.a)

Curses Syntax

#include <curses.h> #include <term.h>

```
set_curterm( Newterm)
TERMINAL *Newterm;
```

The **cur_term** subroutine sets the **cur_term** variable to the terminal specified by the *Newterm* parameter. The cur_term subroutine is useful when the setupterm subroutine is called more than once. The set_curterm subroutine allows the programmer to toggle back and forth between terminals.

When information for a particular terminal is no longer required, remove it using the del_curterm subroutine.

Note: The cur_term subroutine is a low-level subroutine. You should use this subroutine only if your application must deal directly with the terminfo database to handle certain terminal capabilities. For example, use this subroutine if your application programs function keys.

Parameters

Points to a TERMINAL structure. This structure contains information about a specific terminal. Newterm

Examples

To set the **cur_term** variable to point to the my term terminal, use: TERMINAL *newterm; set curterm(newterm);

Related Information

The **setupterm** ("setupterm Subroutine" on page 702) subroutine.

Curses Overview for Programming and List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setscrreg or wsetscrreg Subroutine

Purpose

Creates a software scrolling region within a window.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
setscrreg( Tmargin, Bmargin)
int Tmargin, Bmargin;
wsetscrreg( Window, Tmargin, Bmargin)
WINDOW *Window;
int Tmargin, Bmargin;
```

The setscrreg and wsetscrreg subroutines create a software scrolling region within a window. Use the setscrreg subroutine with the stdscr and the the wsetscrreg subroutine with user-defined windows.

You pass the setscrreg subroutines values for the top line and bottom line of the region. If the setscrreg subroutine and scrollok subroutine are enabled for the region, any attempt to move off the line specified by the *Bmargin* parameter causes all the lines in the region to scroll up one line.

Note: Unlike the idlok subroutine, the setscrreg subroutines have nothing to do with the use of a physical scrolling region capability that the terminal may or may not have.

Parameters

Bmargin Specifies the last line number in the scrolling region.

Tmargin Specifies the first line number in the scrolling region (0 is the top line of the window.)

Window Specifies the window to place the scrolling region in. You specify this parameter only with the

wsetscrreg subroutine.

Examples

1. To set a scrolling region starting at the 10th line and ending at the 30th line in the stdscr, enter: setscrreg(9, 29);

Note: Zero is always the first line.

2. To set a scrolling region starting at the 10th line and ending at the 30th line in the user-defined window my window, enter:

```
WINDOW *mv window:
wsetscrreg(my window, 9, 29);
```

Related Information

The idlok ("idlok Subroutine" on page 651) subroutine, scrollok ("scrollok Subroutine" on page 697) subroutine, wrefresh ("refresh or wrefresh Subroutine" on page 686) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setsyx Subroutine

Purpose

Sets the coordinates of the virtual screen cursor.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
setsyx(Y, X)
int Y, X;
```

The setsyx subroutine sets the coordinates of the virtual screen cursor to the specified row and column coordinates. If Y and X are both -1, then the leaveok flag is set. (leaveok may be set by applications that do not use the cursor.)

The setsyx subroutine is intended for use in combination with the getsyx subroutine. These subroutines should be used by a user-defined function that manipulates curses windows but wants the position of the cursor to remain the same. Such a function would do the following:

- Call the getsyx subroutine to obtain the current virtual cursor coordinates.
- · Continue processing the windows.
- Call the wnoutrefresh subroutine on each window manipulated.
- Call the setsyx subroutine to reset the current virtual cursor coordinates to the original values.
- Refresh the display by calling the doupdate subroutine.

Parameters

- X Specifies the column to set the virtual screen cursor to.
- Specifies the row to set the virtual screen cursor to.

Related Information

The doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine, getsyx ("getsyx Subroutine" on page 646) subroutine, leaveok ("leaveok Subroutine" on page 663) subroutine, wnoutrefresh ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine.

Controlling the Cursor with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Curses Overview for Programming and List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

set_term Subroutine

Purpose

Switches between screens.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

SCREEN *set term (SCREEN *new);

Description

The **set term** subroutine switches between different screens. The *new* argument specifies the current screen.

Parameters

*new

Return Values

Upon successful completion, the **set term** subroutine returns a pointer to the previous screen. Otherwise, it returns a null pointer.

Examples

To make the terminal stored in the user-defined SCREEN variable my terminal the current terminal and then store a pointer to the old terminal in the user-defined variable old terminal, enter:

```
SCREEN *old terminal, *my terminal;
old_terminal = set_term(my_terminal);
```

Related Information

The **initscr** ("initscr and newterm Subroutine" on page 655) subroutine, **newterm** ("newterm Subroutine" on page 672) subroutine.

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

setupterm Subroutine

Purpose

Initializes the terminal structure with the values in the terminfo database.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
#include <term.h>
setupterm( Term, FileNumber, ErrorCode)
char *Term:
int FileNumber;
int *ErrorCode:
```

Description

The **setupterm** subroutine determines the number of lines and columns available on the output terminal. The setupterm subroutine calls the termdef subroutine to define the number of lines and columns on the display. If the termdef subroutine cannot supply this information, the setupterm subroutine uses the values in the terminfo database.

The **setupterm** subroutine initializes the terminal structure with the terminal-dependent capabilities from terminfo. This routine is automatically called by the initscr and newterm subroutines. The setupterm subroutine deals directly with the terminfo database.

Two of the terminal-dependent capabilities are the lines and columns. The setupterm subroutine populates the lines and column fields in the terminal structure in the following manner:

- 1. If the environment variables LINES and COLUMNS are set, the setupterm subroutine uses these values.
- 2. If the environment variables are not set, the setupterm subroutine obtains the lines and columns information from the tty subsystem.
- 3. As a last resort, the **setupterm** subroutine uses the values defined in the **terminfo** database.

Note: These may or may not be the same as the values in the **terminfo** database.

The simplest call is **setupterm((char*) 0, 1, (int*) 0)**, which uses all defaults.

After the call to the setupterm subroutine, the cur_term global variable is set to point to the current structure of terminal capabilities. A program can use more than one terminal at a time by calling the setupterm subroutine for each terminal and then saving and restoring the cur term variable.

Parameters

ErrorCode Specifies a pointer to an integer to return the error code to. If a null pointer (0) is passed for this

parameter, no status is returned. An error causes the setupterm subroutine to print an error

message and exit instead of returning.

Specifies the output files file descriptor (1 equals standard output). FileNumber

Specifies the terminal name. If 0 is passed for this parameter, the value of the \$TERM Term

environment variable is used.

Return Values

One of the following status values is stored into the integer pointed to by the ErrorCode parameter:

- 1 Successful completion.
- No such terminal.
- -1 An error occurred while locating the terminfo database.

Example

To determine the current terminal's capabilities using \$TERM as the terminal name, standard output as output, and returning no error codes, enter:

setupterm((char*) 0, 1, (int*) 0);

Related Information

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

_showstring Subroutine

Purpose

Dumps the string in the specified string address to the terminal at the specified location.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
_showstring(Line, Column, First, Last, String)
int Line, Column, First, Last;
char * String;
```

Description

The _showstring subroutine dumps the string in the specified string address to the terminal at the specified location. This is an internal extended curses subroutine and should not normally be called directly by the program.

Parameters

Column Specifies the horizontal coordinate of the terminal at which to dump the string. First Specifies the beginning string address of the string to dump to the terminal. Last Specifies the end string address of the string to dump to the terminal. Line Specifies the vertical coordinate of the terminal at which to dump the string. String Specifies the string to dump to the terminal.

(void);
int slk_restore
(void);
int slk set
(int labnum,
const char *label,
int justify);
int slk_touch
(void);
int slk_wset
(int labnum,
const wchar t *label,
int justify);
```

Description

The Curses interface manipulates the set of soft function-key labels that exist on many terminals. For those terminals that do not have sort labels, Curses takes over the bottom line of stdscr, reducing the size of stdscr and the value of the LINES external variable. There can be up to eight labels of up to eight display columns each.

To use soft labels, the slk_init subroutine must be called before initscr, newterm, or ripoffline is called. If initscr eventually uses a line from stdscr to emulate the soft labels, then fmt determines how the labels are arranged on the screen. Setting fmt to 0 indicates a 3-2-3 arrangement of the labels; 1 indicates a 4-4 arrangement. Other values for fmt are unspecified.

The **slk** init subroutine has the effect of calling the **ripoffline** subroutine to reserve one screen line to accommodate the requested format.

The slk_set and slk_wset subroutines specify the text of soft label number labnum, within the range from 1 to and including 8. The label argument is the string to be put on the label. With slk_set and slk_wset, the width of the label is limited to eight column positions. A null string or a null pointer specifies a blank label. The justify argument can have the following values to indicate how to justify label within the space reserved for it:

- 0 Align the start of label with the start of the space.
- 1 Center label within the space.
- 2 Align the end of label with the end of the space.

The slk_refresh and slk_noutrefresh subroutines correspond to the wrefresh and wnoutrefresh subroutines.

The **slk_label** subroutine obtains soft label number labnum.

The **slk_clear** subroutine immediately clears the soft labels from the screen.

The slk_touch subroutine forces all the soft labels to be output the next time slk_noutrefresh or slk refresh subroutines is called.

The slk_attron, slk_attrset and slk_attroff subroutines correspond to the attron, attrset, and attroff subroutines. They have an effect only if soft labels are simulated on the bottom line of the screen.

The slk attr off, slk attr on, slk sttr set, and slk attroff subroutines correspond to the slk attroff, slk attron, slk attrset, and color set and thus support the attribute constants with the WA prefix and color.

The opts argument is reserved for definition in a future edition of this document. Currently, the application must provide a null pointer as opts.

Parameters

attrs *opts color_pair_number fmt labnum justify *label

Examples

For the **slk** init subroutine:

To initialize soft labels on a terminal that does not support soft labels internally, do the following: slk init(1);

This example arranges the labels so that four labels appear on the right of the screen and four appear on the left.

For the **slk label** subroutine:

To obtain the label name for soft label 3, use:

```
char *label name;
label_name = slk_label(3);
```

For the slk noutrefresh subroutine:

To refresh soft label 8 on the virtual screen but not on the physical screen, use:

```
slk set(8, "Insert", 1);
slk noutrefresh();
```

For the **slk refresh** subroutine:

To set and left-justify the soft labels and then refresh the physical screen, use:

```
slk init(0);
initscr();
slk set(1, "Insert", 0);
slk_set(2, "Quit", 0);
slk set(3, "Add", 0);
slk_set(4, "Delete", 0);
slk_set(5, "Undo", 0);
slk_set(6, "Search", 0);
slk_set(7, "Replace", 0);
slk_set(8, "Save", 0);
slk refresh();
```

For the **slk set** subroutine:

```
slk set(2, "Quit", 1);
```

Return Values

Upon successful completion, the slk_label subroutine returns the requested label with leading and trailing blanks stripped. Otherwise, it returns a null pointer.

Upon successful completion, the other subroutines return OK. Otherwise, they return ERR.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk_init Subroutine

Purpose

Initializes soft function-key labels.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
slk init( Labfmt)
int Labfmt;
```

Description

The slk_init subroutine initializes soft function-key labels. This is one of several subroutines curses provides for manipulating soft function-key labels. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look. To use soft labels, you must call the slk_init subroutine before calling the initscr or newterm subroutine.

Some terminals support soft labels, others do not. For terminals that do not support soft labels. Curses emulates soft labels by using the bottom line of the stdscr. To accommodate soft labels, curses reduces the size of the stdscr and the **LINES** environment variable as required.

Parameter

Labfmt

Simulates soft labels. To arrange three labels on the right, two in the center, and three on the right of the screen, specify a 0 for this parameter. To arrange four labels on the left and four on the right of the screen, specify a 1 for this parameter.

Example

To initialize soft labels on a terminal that does not support soft labels internally, do the following: slk init(1);

This example arranges the labels so that four labels appear on the right of the screen and four appear on the left.

Related Information

The initscr ("initscr and newterm Subroutine" on page 655) subroutine, newterm ("newterm Subroutine" on page 672) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Soft Labels in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk label Subroutine

Purpose

Returns the label name for a specified soft label.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

char *slk label(LabNum) int LabNum;

Description

The slk label subroutine returns the label name for a specified soft function-key label. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look. The slk label subroutine returns the name in the format it was in when passed to the slk set subroutine. If the name was justified by the slk set subroutine, the justification is removed.

Parameters

LabNum Specifies the label number. This parameter must be in the range 1 to 8.

Example

To obtain the label name for soft label 3, use:

```
char *label name;
label name = slk label(3);
```

Return Values

NULL Indicates a label number that is not valid or a label number not set with the slk_set subroutine.

OK Indicates that the label name was successfully retrieved.

Related Information

The slk_init ("slk_init Subroutine" on page 707) subroutine and slk_set ("slk_set Subroutine" on page 711) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk noutrefresh Subroutine

Purpose

Updates the soft labels on the virtual screen.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> slk noutrefresh()

Description

The slk_noutrefresh subroutine updates the soft function-key labels on the virtual screen. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look. This subroutine is useful for updating multiple labels. You can use the slk_noutrefresh subroutine to update all soft labels on the virtual screen with no updates to the physic al screen. To update the physical screen, use the slk refresh or refresh subroutine.

Example

To refresh soft label 8 on the virtual screen but not on the physical screen, use:

```
slk set(8, "Insert", 1);
slk_noutrefresh();
```

Related Information

The slk_init ("slk_init Subroutine" on page 707) subroutine, slk_refresh ("slk_refresh Subroutine") subroutine, wrefresh ("refresh or wrefresh Subroutine" on page 686) subroutine.

Curses Overview for Programming, Manipulating Video Attributes, List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk_refresh Subroutine

Purpose

Updates soft labels on the virtual and physical screens.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
slk_refresh()
```

Description

The slk_refresh subroutine refreshes the virtual and physical screens after an update to soft function-key labels. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look.

Example

To set and left-justify the soft labels and then refresh the physical screen, use:

```
slk init(0);
initscr();
slk_set(1, "Insert", 0);
slk_set(2, "Quit", 0);
slk_set(3, "Add", 0);
slk_set(4, "Delete", 0);
slk_set(5, "Undo", 0);
slk_set(6, "Search", 0);
slk_set(7, "Replace", 0);
slk_set(8, "Save", 0);
slk refresh();
```

Related Information

The slk_init routine ("slk_init Subroutine" on page 707) subroutine, slk_set routine ("slk_set Subroutine" on page 711) subroutine, slk_noutrefresh ("slk_noutrefresh Subroutine" on page 709) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk_restore Subroutine

Purpose

Restores soft function-key labels to the screen.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
slk restore()
```

Description

The slk_restore subroutine restores the soft function-key labels to the screen after a call to the slk_clear subroutine. The label names are not restored. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look. You must call the slk_init subroutine before you can use soft labels.

Related Information

The slk_init ("slk_init Subroutine" on page 707) subroutine, slk_clear ("slk_attroff, slk_attr_off, slk_attron, slk_attrset, slk_attr_set, slk_clear, slk_color, slk_init, slk_label, slk_noutrefresh, slk_refresh, slk_restore, slk set, slk touch, slk wset, Subroutine" on page 704) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Soft Labels in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk_set Subroutine

Purpose

Sets up soft function-key labels.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
```

```
slk_set(LabNum, LabStr, LabFmt)
int LabNum;
char * LabStr;
int LabFmt;
```

Description

The slk_set subroutine sets up each soft function-key label with the appropriate name. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look. Label names are restricted to 8 characters each.

Parameters

LabNum Specifies the label number. The value can range from 1 to 8.

LabStr Specifies the string (name) to put on the label. If the string is NULL, the label is blank. LabFmt Specifies the label alignment. The following values are valid:

- 0 Left-justified
- 1 Centered
- Right-justified

Example

```
slk set(2, "Quit", 1);
```

Related Information

The **slk_init** ("slk_init Subroutine" on page 707) routine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

slk touch Subroutine

Purpose

Forces an update of the soft function-key labels.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> slk touch()

Description

The slk_touch subroutine forces an update of the soft function-key labels on the physical screen the next time the slk_noutrefresh subroutine is called. These labels appear at the bottom of the screen and give applications, such as editors, a more user-friendly look. You must call the slk init subroutine before using soft labels.

Related Information

The slk_init ("slk_init Subroutine" on page 707) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

standend, standout, wstandend, or wstandout Subroutine

Purpose

Sets and clears window attributes.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int standend
(void);
int standout
(void);
int wstandend
(WINDOW *win);
int wstandout
(WINDOW *win);
```

Description

The **standend** and **standout** subroutines turn off all attributes of the current or specified window.

The wstandout and wstandend subroutines turn on the standout attribute of the current or specified window.

Parameters

*win Specifies the window in which to set the attributes.

Return Values

These subroutines always return 1.

Examples

1. To turn on the **standout** attribute in the stdscr, enter:

```
standout();
```

This example is functionally equivalent to:

```
attron(A_STANDOUT);
```

2. To turn on the **standout** attribute in the user-defined window my window, enter:

```
WINDOW *my window;
wstandout(my_window);
```

This example is functionally equivalent to:

```
wattron(my_window, A_STANDOUT);
```

3. To turn off the **standout** attribute in the default window, enter:

```
standend();
```

This example is functionally equivalent to:

```
attroff(A_STANDOUT);
```

4. To turn off the **standout** attribute in the user-defined window my window, enter:

```
WINDOW *my_window;
wstandend(my_window);
```

This example is functionally equivalent to:

```
wattroff(my window, A STANDOUT);
```

Related Information

The attroff, attron, or wattroff ("attroff, attron, attrset, wattroff, wattron, or wattrset Subroutine" on page 604) subroutines.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

start color Subroutine

Purpose

Initializes color.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> start_color()

Description

The **start color** subroutine initializes color. This subroutine requires no arguments. You must call the start_color subroutine if you intend to use color in your application. Except for the has_colors and can change color subroutines, you must call the start color subroutine before any other color manipulation subroutine. A good time to call start_color is right after calling the initscr routine and after establishing whether the terminal supports color.

The **start_color** routine initializes the following basic colors:

COLOR_BLACK	0
COLOR_BLUE	1
COLOR_GREEN	2
COLOR_CYAN	3
COLOR_RED	4
COLOR_MAGENTA	5
COLOR_YELLOW	6
COLOR_WHITE	7

The subroutine also initializes two global variables: COLORS and COLOR_PAIRS. The COLORS variable is the maximum number of colors supported by the terminal. The COLOR_PAIRS variable is the maximum number of color-pairs supported by the terminal.

The start_color subroutine also restores the terminal's colors to the original values right after the terminal was turned on.

Return Values

ERR Indicates the terminal does not support colors. OK Indicates the terminal does support colors.

Example

To enable the color support for a terminal that supports color, use: start color();

Related Information

The has colors ("has colors Subroutine" on page 648) subroutine, can change color ("can change color, color content, has colors, init color, init pair, start color or pair content Subroutine" on page 610) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Manipulating Video Attributes in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

subpad Subroutine

Purpose

Creates a subwindow within a pad.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
WINDOW *subpad(Orig, NLines, NCols, Begin Y, Begin X)
WINDOW * Orig;
int NCols, NLines, Begin Y, Begin X;
```

Description

The **subpad** subroutine creates and returns a pointer to a subpad. A subpad is a window within a pad. You specify the size of the subpad by supplying a starting coordinate and the number of rows and columns within the subpad. Unlike the subwin subroutine, the starting coordinates are relative to the pad and not the terminal's display.

Changes to the subpad affect the character image of the parent pad, as well. If you change a subpad, use the touchwin or touchline subroutine on the parent pad before refreshing the parent pad. Use the prefresh subroutine to refresh a pad.

Parameters

Oria Points to the parent pad.

NLines Specifies the number of lines (rows) in the subpad. NCols Specifies the number of columns in the subpad.

Begin Y Identifies the upper left-hand row coordinate of the subpad relative to the parent pad. Begin_X Identifies the upper left-hand column coordinate of the subpad relative to the parent pad.

Examples

```
To create a subpad, use:
```

```
WINDOW *orig, *mypad;
orig = newpad(100, 200);
mypad = subpad(orig, 30, 5, 25, 180);
```

The parent pad is 100 lines by 200 columns. The subpad is 30 lines by 5 columns and starts in line 25, column 180 of the parent pad.

Related Information

Curses Overview for Programming, List of Curses Subroutines, Windows in the Curses Environment in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

subwin Subroutine

Purpose

Creates a subwindow within an existing window.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h> WINDOW *subwin (ParentWindow, NumLines, NumCols,Line,Column) **WINDOW** * ParentWindow; int NumLines, NumCols, Line, Column;

Description

The **subwin** subroutine creates a subwindow within an existing window. You must supply coordinates for the subwindow relative to the terminal's display. Recall that the subwindow shares its parent's window buffer. Changes made to the shared window buffer in the area covered by a subwindow, through either the parent window or any of its subwindows, affects all windows sharing the window buffer.

When changing the image of a subwindow, it is necessary to call the **touchwin** ("touchwin Subroutine" on page 728) or touchline subroutine on the parent window before calling the wrefresh ("refresh or wrefresh Subroutine" on page 686) subroutine on the parent window.

Changes to one window will affect the character image of both windows.

Parameters

NumCols Indicates the number of vertical columns in the subwindow's width. If 0 is passed as the NumCols value, the subwindow runs from the Column to the right edge of its parent window. NumLines Indicates the number of horizontal lines in the subwindow's height. If 0 is passed as the

NumLines parameter, then the subwindow runs from the Line to the bottom of its parent

window.

ParentWindow Specifies the subwindow's parent.

Column Specifies the horizontal coordinate for the upper-left corner of the subwindow. This coordinate

is relative to the (0, 0) coordinates of the terminal, not the (0, 0) coordinates of the parent

window.

Note: The upper-left corner of the terminal is referenced by the coordinates (0, 0).

Specifies the vertical coordinate for the upper-left corner of the subwindow. This coordinate is Line

relative to the (0, 0) coordinates of the terminal, not the (0, 0) coordinates of the parent

window.

Note: The upper-left corner of the terminal is referenced by the coordinates (0, 0).

Return Values

When the **subwin** subroutine is successful, it returns a pointer to the subwindow structure. Otherwise, it returns the following:

ERR Indicates one or more of the parameters is invalid or there is insufficient storage available for the new structure.

Examples

1. To create a subwindow, use:

```
WINDOW *my window, *my sub window;
my window = newwin ("derwin, newwin, or subwin Subroutine" on page 674)
                (5, 10, 20, 30);
my_sub_window = subwin(my_window, 2, 5, 20, 30);
```

my sub window is now a subwindow 2 lines deep, 5 columns wide, starting at the same coordinates of its parent window my window. That is, the subwindow's upper-left corner is at coordinates y = 20, x = 30 and lower-right corner is at coordinates y = 21, x = 34.

2. To create a subwindow that is flush with the right side of its parent, use:

```
WINDOW *my window, *my sub window;
my window = newwin ("derwin, newwin, or subwin Subroutine" on page 674)
                (5, 10, 20, 30);
my sub window = subwin(my window, 2, 0, 20, 30);
```

my sub window is now a subwindow 2 lines deep, extending all the way to the right side of its parent window my window, and starting at the same coordinates. That is, the subwindow's upper-left corner is at coordinates y = 20, x = 30 and lower-right corner is at coordinates y = 21, x = 39.

3. To create a subwindow in the lower-right corner of its parent, use:

```
WINDOW *my window, *my sub window
my window = newwwin ("derwin, newwin, or subwin Subroutine" on page 674)
             (5, 10, 20, 30);
my_sub_window = subwin(my_window, 0, 0, 22, 35);
my sub window is now a subwindow that fills the bottom right corner of its parent window, my window,
starting at the coordinates y = 22, x = 35. That is, the subwindow's upper-left corner is at coordinates
y = 22, x = 35 and lower-right corner is at coordinates y = 24, x = 39.
```

Related Information

The touchwin ("touchwin Subroutine" on page 728), newwin ("derwin, newwin, or subwin Subroutine" on page 674), and wrefresh ("refresh or wrefresh Subroutine" on page 686) subroutines.

Curses Overview for Programming, List of Curses Subroutines, Windows in the Curses Environment in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tgetent, tgetflag, tgetnum, tgetstr, or tgoto Subroutine

Purpose

Termcap database emulation.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int tgetent
(char *bp,
const char *name);
int tgetflag
(char id[2]);
int tgetnum
(char id[2]);
char *tgetstr
(char id[2],
char **area);
char *tgoto
(char *cap,
int col,
int row);
```

Description

The **tgetent** subroutine looks up the termcap entry for *name*, The emulation ignores the buffer pointer *bp*.

The **tgetflag** subroutine gets the boolean entry for *id*.

The **tgetnum** subroutine gets the numeric entry for *id*.

The **tgetstr** subroutine gets the string entry for *id*. If *area* is not a null pointer and does not point to a null pointer, the **tgetstr** subroutine copies the string entry into the buffer pointed to by *area and advances the variable pointed to by area to the first byte after the copy of the string entry.

The **tgoto** subroutine instantiates the parameters *col* and *row* into the capability cap and returns a pointer to the resulting string.

All of the information available in the terminfo database need not be available through these subroutines.

Parameters

```
bp
name
col
row
**area
cap id[2]
```

Return Values

Upon successful completion, subroutines that return an integer return OK. Otherwise, they return ERR.

Related Information

The putc, setupterm ("setupterm Subroutine" on page 702), tigetflg ("tigetflag, tigetnum, tigetstr, or tparm Subroutine" on page 722) subroutines.

tgetflag Subroutine

Purpose

Returns the boolean entry for the specified identifier.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

bool tgetflag(ID) char *ID;

Description

The tgetflag subroutine returns the boolean entry for the specified termcap identifier. This subroutine is provided for binary compatibility with applications that use the termcap file.

Parameters

ID Specifies the 2-character string that contains a termcap identifier.

Return Values

The **tgetflag** subroutine returns the boolean entry for the specified **termcap** identifier. If ID is not found, on not a boolean, 0 is returned.

Related Information

tgetnum Subroutine

Purpose

Returns the numeric entry for the specified **termcap** identifier.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

int tgetnum(ID) char *ID;

Description

The tgetnum subroutine returns the numeric entry for the specified termcap identifier. This subroutine is provided for binary compatibility with applications that use the **termcap** file.

Parameters

Specifies the 2-character string that contains a termcap identifier.

Return Values

The **tgetnum** subroutine returns the numeric entry for the specified **termcap** identifier.

Returned if the ID is not found or not numeric.

Related Information

tgetstr Subroutine

Purpose

Returns the string entry for the specified **termcap** identifier.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

```
char *tgetstr( ID, Area)
char *ID, **Area;
```

Description

The tgetstr subroutine returns the string entry for the specified termcap identifier. This subroutine is provided for binary compatibility with applications that use the **termcap** file.

Parameters

Area Contains the string entry for the specified termcap identifier. This also is returned to the calling program. ID Specifies the 2-character string that contains the **termcap** identifier.

Return Values

The tgetstr subroutine returns the string entry for the ID parameter, which is a 2-character string that contains a termcap identifier.

Returned if ID is not found or not a string capability.

Related Information

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tgoto Subroutine

Purpose

Duplicates the **tparm** subroutine.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
#include <term.h>
char *tgoto( Capability, Column, Row)
char *Capability;
int Column, Row;
```

Description

The **tgoto** subroutine calls the **tparm** ("tparm Subroutine" on page 729) subroutine. This subroutine is provided for binary compatibility with applications that use the **termcap** file.

Parameters

Capability Specifies the termcap capability to apply the parameters to.

Column Specifies which column to apply to the capability. Row Specifies which row to apply to the capability.

Related Information

The **tparm** ("tparm Subroutine" on page 729) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tigetflag, tigetnum, tigetstr, or tparm Subroutine

Purpose

Retrieves capabilities from the **terminfo** database.

Library

Curses Library (libcurses.a)

Syntax

```
#include <term.h>
int tigetflag(char *capname,);
int tigetnum(char *capname);
char *tigetstr(char *capname);
char *tparm(char *cap,
long p1, long p2, long p3,
long p4, long p5, long p6
long p7, long p8, long p9);
```

Description

The tigetflag, tigetnum, and tigetstr subroutines obtain boolean, numeric, and string capabilities, respectively, from the selected record of the terminfo database. For each capability, the value to use as capname appears in the Capname column in the table in Section 6.1.3 on page 296.

The **tparm** subroutine takes as *cap* a string capability. If *cap* is parameterised (as described in Section A.1.2 on page 313), the **tparm** subroutine resolves the parameterisation. If the parameterised string refers to parameters %p1 through %p9, then the **tparm** subroutine substitutes the values of p1 through p9, respectively.

Return Values

Upon successful completion, the tigetflag, tigetnum, and tigetstr subroutines return the specified capability. The tigetflag subroutine returns -1 if capname is not a boolean capability. The tigetnum subroutine returns -2 if capname is not a numeric capability. The tigetstr subroutine returns (char*)-1 if capname is not a string capability.

Upon successful completion, the **tparm** subroutine returns *str* with parameterisation resolved. Otherwise, it returns a null pointer.

Parameters

```
*capname
*tparm
long p1
long p2
long p3
long p4
long p5
long p6
long p7
long p8
long p9
```

Examples

For the tigetflag subroutine:

To determine if erase overstrike is a defined boolean capability for the current terminal, use: rc = tigetflag("eo");

For the tigetnum subroutine:

To determine if number of labels is a defined numeric capability for the current terminal, use: rc = tigetnum("nlab");

For the tigetstr subroutine:

To determine if "turn on soft labels" is a defined string capability for the current terminal, do the following:

```
char *rc;
rc = tigetstr("smln");
```

For the tparm subroutine:

1. To save the escape sequence used to home the cursor in the user-defined variable home sequence, enter:

```
home sequence = tparm(cursor home);
```

2. To save the escape sequence used to move the cursor to the coordinates X=40, Y=18 in the user-defined variable move sequence, enter:

```
move sequence = tparm(cursor_address, 18, 40);
```

Related Information

The def_prog_mode ("def_prog_mode, def_shell_mode, reset_prog_mode or reset_shell_mode Subroutine" on page 623), tgetent ("tgetent, tgetflag, tgetnum, tgetstr, or tgoto Subroutine" on page 718), and putp ("putp, tputs Subroutine" on page 683) subroutines.

Curses Overview for Programming, List of Curses Subroutines

Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tigetnum Subroutine

Purpose

Gets the value of terminal's numeric capability.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
#include <term.h>
tigetnum( CapName)
register char *CapName;
```

Description

The tigetnum subroutine returns the value of terminal's numeric capability. Use this subroutine to get a capability for the current terminal. When successful, this subroutine returns the current value of the capability specified by the CapName parameter. Otherwise, if it is not a numeric value, this subroutine returns -2.

Note: The **tigetnum** subroutine is a low-level routine. Use this subroutine only if your application must deal directly with the terminfo database to handle certain terminal capabilities (for example, programming function keys).

Return Values

Upon successful completion, the tigetnum subroutine returns the value of terminal's numeric capability.

Indicates the value specified by the CapName parameter is not numeric.

Parameters

CapName Identifies the terminal capability to check for.

Example

To determine if number of labels is a defined numeric capability for the current terminal, use: rc = tigetnum("nlab");

Related Information

tigetstr Routine

Purpose

Returns the value of a terminal's string capability.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
#include <term.h>
tigetstr( Capname)
register char *Capname;
```

Description

The tigetstr subroutine returns the value of terminal's string capability. Use this subroutine to get a capability for the current terminal pointed to by cur_term. When successful, this subroutine returns the current value of the capability specified by the Capname parameter. Otherwise, if it is not a string value, this subroutine returns (char*) -1.

Note: The **tigetstr** subroutine is a low-level routine. Use this subroutine only if your application must deal directly with the terminfo database to handle certain terminal capabilities (for example, programming function keys).

Parameters

Capname Identifies the terminal capability to check.

Example

To determine if "turn on soft labels" is a defined string capability for the current terminal, do the following:

```
char *rc;
rc = tigetstr("smln");
```

Return Values

Upon successful completion, the tigetstr subroutine returns the value of terminal's string capability.

(char *)-1 Indicates the value specified by the Capname parameter is not a string.

Files

/usr/include/curses.h

Contains C language subroutines and define statements for curses.

Related Information

is_linetouched, is_wintouched, touchline, touchwin, untouchwin, or wtouchin Subroutine

Purpose

Window refresh control functions.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
bool is linetouched(WINDOW *win,
int line);
bool is_wintouched(WINDOW *win);
int touchline(WINDOW *win,
int start,
int count);
int touchwin(WINDOW *win);
int untouchwin(WINDOW *win);
int wtouchln(WINDOW *win,
int y,
int n,
int changed);
```

Description

The touchline subroutine touches the specified window (that is, marks it as having changed more recently than the last refresh operation). The touchline subroutine only touches count lines, beginning with line start.

The untouchwin subroutine marks all lines in the window as unchanged since the last refresh operation.

Calling the wtouchln subroutine, if changed is 1, touches n lines in the specified window, starting at line y. If changed is 0, wtouchIn marks such lines as unchanged since the last refresh operation.

The is_wintouchwin subroutine determines whether the specified window is touched. The is_linetouched subroutine determines whether line line of the specified window is touched.

Parameters

```
line
start
count
changed
V
n
*win
```

Return Values

The is linetouched and is_wintouched subroutines return TRUE if any of the specified lines, or the specified window, respectively, has been touched since the last refresh operation. Otherwise, they return FALSE.

Upon successful completion, the other subroutines return OK. Otherwise, they return ERR. Exceptions to this are noted in the preceding subroutine.

Examples

For the touchline subroutine:

To set 10 lines for refresh starting from line 5 of the user-defined window my window, use:

```
WINDOW *my window;
touchline (my window, 5, 10);
wrefresh(my window);
```

This forces curses to disregard any optimization information it may have for lines 0-4 in my window. curses assumes all characters in lines 0-4 have changed.

For the touchwin subroutine:

To refresh a user-defined parent window, parent window, that has been edited through its subwindows, use:

```
WINDOW *parent window;
touchwin(parent_window);
wrefresh(parent window);
```

This forces curses to disregard any optimization information it may have for my window. curses assumes all lines and columns have changed for my window.

Related Information

The doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735) subroutine.

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

touchoverlap Subroutine

Purpose

Marks the overlap of two windows as changed and makes arrangements for their refresh.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

touchoverlap(Window1, Window2) WINDOW *Window1, Window2;

Description

The touchoverlap subroutine marks the overlap of two windows as changed and makes arrangements for their refresh.

Parameters

Window1 Specifies the first window as changed. Window2 Specifies the second window as changed.

Examples

To mark the overlap of the two user-defined windows my window and my new window as changed, enter: touchoverlap(my window, my new window);

Related Information

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Understanding Windows with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

touchwin Subroutine

Purpose

Forces every character in a window's buffer to be refreshed at the next call to the wrefresh subroutine.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

touchwin(Window) WINDOW *Window;

Description

The touchwin ("touchwin Subroutine") subroutine forces every character in the specified window to be refreshed during the next call to the refresh or wrefresh subroutine. To force a specific range of lines to be refreshed, use the touchline ("is_linetouched, is_wintouched, touchline, touchwin, untouchwin, or wtouchin Subroutine" on page 726) subroutine.

The combined usage of the **touchwin** and **wrefresh** subroutines is helpful when dealing with subwindows or overlapping windows. When dealing with overlapping windows, it may become necessary to bring the back window to the front. A call to the wrefresh subroutine does not change the terminal because none of the characters in the window were changed. Calling the touchwin subroutine on the back window before the wrefresh subroutine redisplays the window on the terminal and, effectively, brings it to the front.

Parameters

Window Specifies the window to be touched.

Example

To refresh a user-defined parent window, parent window, that has been edited through its subwindows,

```
WINDOW *parent window;
touchwin(parent window);
wrefresh(parent window);
```

This forces curses to disregard any optimization information it may have for my window. curses assumes all lines and columns have changed for my window.

Related Information

The touchline ("is_linetouched, is_wintouched, touchline, touchwin, untouchwin, or wtouchin Subroutine" on page 726) subroutine, wrefresh ("refresh or wrefresh Subroutine" on page 686) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Windows in the Curses Environment in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

tparm Subroutine

Purpose

Applies parameters (padding) to a terminal capability.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
char *tparm( TermCap, Parm1, Parm2, . . . Parm9)
char *TermCap;
int Parm1, Parm2, . . . Parm9;
```

Description

The **tparm** subroutine applies parameters (padding) to a terminal capability.

Note: If the tparm subroutine is called with less than 10 paramameters, then the -D_TPARM_COMPAT option should be used when compiling the program. Otherwise the compiler gives the following error.

```
1506-098 (E) Missing argument(s)
```

Parameters

Parm# Specifies the parameters (up to nine) to instantiate.

TermCap Specifies the terminal capability to apply the parameters to. These terminal capabilities are defined in

Return Values

The **tparm** subroutine returns the escape sequence specified by the *TermCap* parameter with the specified parameters applied. After the escape sequence is received, it can be output by a subroutine like the **tputs** ("tputs Subroutine") subroutine.

Examples

1. To save the escape sequence used to home the cursor in the user-defined variable home sequence, enter:

```
home sequence = tparm(cursor home);
```

2. To save the escape sequence used to move the cursor to the coordinates X=40, Y=18 in the user-defined variable move sequence, enter:

```
move sequence = tparm(cursor address, 18, 40);
```

Related Information

tputs Subroutine

Purpose

Outputs a string with padding information.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
#include <term.h>
tputs( String, LinesAffected, PutcLikeSub)
char *String;
int LinesAffected;
int (*PutcLikeSub) ();
```

Description

The **tputs** subroutine outputs a string with padding information applied. String must be a terminfo string variable or the return value from tparm, tgetstr, tigetstr, or tgoto subroutines.

Parameters

LinesAffected Specifies the number of lines affected, or specifies 1 if not applicable.

PutcLikeSub Specifies a putchar-like subroutine through which the characters are passed one at a time.

Specifies the string to which to add padding information. Strina

Examples

1. To output the clear screen sequence using the user-defined putchar-like subroutine my_putchar, enter:

```
int my putchar();
tputs(clear_screen, 1 ,my_putchar);
```

2. To output the escape sequence used to move the cursor to the coordinates x=40, y=18 through the user-defined putchar-like subroutine my putchar, enter:

```
int my putchar();
tputs(tparm(cursor_address, 18, 40), 1, my_putchar);
```

Related Information

The **tparm** ("tparm Subroutine" on page 729) subroutine.

Curses Overview for Programming, List of Curses Subroutines, Understanding Terminals with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

typeahead Subroutine

Purpose

Controls checking for typeahead.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int typeahead
(int fildes);
```

Description

The typeahead subroutine controls the detection of typeahead during a refresh, based on the value of fildes:

- If fildes is a valid file descriptor, the typeahead subroutine is enabled during refresh; Curses periodically checks fildes for input and aborts refresh if any character is available. (This is the initial setting, and the typeahead file descriptor corresponds to the input file associated with the screen created by the initscr or newterm subroutine.) The value of fildes need not be the file descriptor on which the refresh is occurring.
- If *fildes* is -1, Curses does not check for typeahead during refresh.

Parameters

fildes

Return Value

Upon successful completion, the typeahead subroutine returns OK. Otherwise, it returns ERR.

Example

To turn typeahead checking on, enter:

typeahead(1);

Related Information

The doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines" on page 735), getch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639), and initscr ("initscr and newterm Subroutine" on page 655) subroutines.

Setting Video Attributes and Curses Options in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

unctrl Subroutine

Purpose

Generates a printable representation of a character.

Library

Curses Library (libcurses.a)

Syntax

#include <curses.h>

char *unctrl (chtype c);

Description

The **unctrl** subroutine generates a character string that is a printable representation of c. If c is a control character, it is converted to the ^X notation. If c contains rendition information, the effect is undefined.

Parameters

С

Return Values

Upon successful completion, the unctrl subroutine returns the generated string. Otherwise, it returns a null pointer.

Examples

To display a printable representation of the newline character, enter:

```
char *new line;
int my character;
addstr ("Hit the enter key.");
my_character=getch();
new_line=unctrl (my_character);
printw (Newline=%s", new_line);
refresh();
```

This prints, "newline=\J".

Related Information

The **keyname** ("keyname, key_name Subroutine" on page 659) subroutine.

Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

ungetch, unget_wch Subroutine

Purpose

Pushes a character onto the input queue.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int ungetch
(int ch);
int unget_wch
(const wchar_t wch);
```

Description

The **ungetch** subroutine pushes the single-byte character *ch* onto the head of the input queue.

The **unget_wch** subroutine pushes the wide character *wch* onto the head of the input queue.

One character of push-back is guaranteed. The result of successive calls without an intervening call to the getch or get_wch subroutine are unspecified.

Parameters

ch wch

Examples

To force the key KEY ENTER back into the queue, use: ungetch(KEY ENTER);

Related Information

The getch or wgetch ("getch, mvgetch, mvwgetch, or wgetch Subroutine" on page 639) subroutine.

Curses Overview for Programming and List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Manipulating Characters with Curses in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

vidattr, vid_attr, vidputs, or vid_puts Subroutine

Purpose

Outputs attributes to the terminal.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int vidattr
(chtype attr);
int vid attr
(attr t attr,
short color pair number,
void *opt);
int vidputs
(chtype attr,
int (*putfunc)(int));
int vid_puts
(attr_t attr,
short color_pair_number,
void *opt.
int (*putfunc)(int));
```

Description

These subroutines output commands to a terminal that changes the terminal's attributes.

If the terminfo database indicates that the terminal in use can display characters in the rendition specified by attr, then the vadattr subroutine outputs one or more commands to request that the terminal display subsequent characters in that rendition. The subroutine outputs by calling the putchar subroutine. The vidattr subroutine neither relies on nor updates the model that Curses maintains of the prior rendition mode.

The **vidputs** subroutine computes the same terminal output string that **vidattr** does, based on *attr*, but the vidputs subroutine outputs by calling the user-supplied subroutine putfunc. The vid_attr and vid_puts subroutines correspond to vidattr and vidputs respectively, but take a set of arguments, one of type attr t for the attributes, short for the color pair number and a void *, and thus support the attribute constants with the WA prefix.

The opts argument is reserved for definition in a future edition of this document. Currently, the application must provide a null pointer as opts.

The user-supplied putfunc subroutine (which can be specified as an argument to either vidputs or vid_puts is either putchar or some other subroutine with the same prototype. Both the vidputs and the **vid puts** subroutines ignore the return value of **putfunc**.

Parameters

```
att
color_pair_number
*opt
*putfunc
```

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

1. To output the string that puts the terminal in its best standout mode through the putchar subroutine, enter

```
vidattr(A STANDOUT);
```

2. To output the string that puts the terminal in its best standout mode through the putchar-like subroutine my putc, enter

```
int (*my putc) ();
vidputs(A_STANDOUT, my putc);
```

Related Information

The doupdate ("doupdate, refresh, wnoutrefresh, or wrefresh Subroutines"), is linetouched ("is_linetouched, is_wintouched, touchline, touchwin, untouchwin, or wtouchin Subroutine" on page 726), putchar, putwchar and tigetflag ("tigetflag, tigetnum, tigetstr, or tparm Subroutine" on page 722) subroutines.

Curses Overview for Programming in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

List of Curses Subroutines in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

Setting Video Attributes and Curses Options in AIX 5L Version 5.3 General Programming Concepts: Writing and Debugging Programs.

doupdate, refresh, wnoutrefresh, or wrefresh Subroutines

Purpose

Refreshes windows and lines.

Library

Curses Library (libcurses.a)

Syntax

```
#include <curses.h>
int doupdate(void);
int refresh(void);
int wnoutrefresh(WINDOW *win);
int wrefresh(WINDOW *win);
```

Description

The **refresh** and **wrefresh** subroutines refresh the current or specified window. The subroutines position the terminal's cursor at the cursor position of the window, except that, if the leaveok mode has been enabled, they may leave the cursor at an arbitrary position.

The wnoutrefresh subroutine determines which parts of the terminal may need updating.

The **doupdate** subroutine sends to the terminal the commands to perform any required changes.

Parameters

*win Specifies the window to be refreshed.

Return Values

Upon successful completion, these subroutines return OK. Otherwise, they return ERR.

Examples

For the **doupdate** or **wnoutrefresh** subroutine:

To update the user-defined windows my_window1 and my_window2, enter:

```
WINDOW *my window1, my window2;
wnoutrefresh(my window1);
wnoutrefresh(my window2);
doupdate();
```

For the **refresh** or **wrefresh** subroutine:

1. To update the terminal's display and the current screen structure to reflect changes made to the standard screen structure, use:

```
refresh();
```

2. To update the terminal and the current screen structure to reflect changes made to a user-defined window called my window, use:

```
WINDOW *my window;
wrefresh(my window);
```

3. To restore the terminal to its state at the last refresh, use:

```
wrefresh(curscr);
```

This subroutine is useful if the terminal becomes garbled for any reason.

Related Information

The **clearok** ("clearok, idlok, leaveok, scrollok, setscrreg or wsetscrreg Subroutine" on page 615) subroutine.

Chapter 3. FORTRAN Basic Linear Algebra Subroutines (BLAS)

SDOT or DDOT Function

Purpose

Returns the dot product of two vectors.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
REAL FUNCTION SDOT(N, X, INCX, Y, INCY)

INTEGER INCX, INCY, N

REAL X(*), Y(*)

DOUBLE PRECISION FUNCTION DDOT(N, X, INCX, Y, INCY)

INTEGER INCX, INCY, N

DOUBLE PRECISION X(*), Y(*)
```

Description

The **SDOT** or **DDOT** function returns the dot product of vectors *X* and *Y*.

Parameters

```
N On entry, N specifies the number of elements in X and Y; unchanged on exit. X Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit. INCX On entry, INCX specifies the increment for the elements of X; unchanged on exit. Y Vector of dimension at least (1 + (N-1) * abs(INCY)); unchanged on exit. INCY On entry, INCY specifies the increment for the elements of Y; unchanged on exit.
```

Error Codes

For values of $N \le 0$, a value of 0 is returned.

CDOTC or ZDOTC Function

Purpose

Returns the complex dot product of two vectors, conjugating the first.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
COMPLEX FUNCTION CDOTC(N, X, INCX, Y, INCY)
INTEGER INCX, INCY, N
COMPLEX X(*), Y(*)
```

```
DOUBLE COMPLEX FUNCTION ZDOTC (N, X, INCX, Y, INCY)
INTEGER INCX, INCY, N
COMPLEX*16 X(*), Y(*)
```

The CDOTC or ZDOTC function returns the complex dot product of two vectors, conjugating the first.

Parameters

Ν On entry, *N* specifies the number of elements in *X* and *Y*; unchanged on exit. Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit. **INCX** On entry, INCX specifies the increment for the elements of X; unchanged on exit. Vector of dimension at least (1 + (N-1) * abs(INCY)); unchanged on exit. INCY

On entry, INCY specifies the increment for the elements of Y; unchanged on exit.

Error Codes

For values of $N \le 0$, a value of 0 is returned.

CDOTU or ZDOTU Function

Purpose

Returns the complex dot product of two vectors.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
COMPLEX FUNCTION CDOTU(N, X, INCX, Y, INCY)
INTEGER INCX, INCY, N
COMPLEX X(*), Y(*)
DOUBLE COMPLEX FUNCTION ZDOTU(N, X, INCX, Y, INCY)
INTEGER INCX, INCY, N
COMPLEX*16 X(*), Y(*)
```

Description

The CDOTU or ZDOTU function returns the complex dot product of two vectors.

Parameters

Ν On entry, N specifies the number of elements in X and Y; unchanged on exit. Χ Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit. INCX On entry, *INCX* specifies the increment for the elements of *X*; unchanged on exit. Vector of dimension at least (1 + (N-1) * abs(INCY)); unchanged on exit. INCY On entry, INCY specifies the increment for the elements of Y; unchanged on exit.

Error Codes

For values of $N \le 0$, a value of 0 is returned.

SAXPY, DAXPY, CAXPY, or ZAXPY Subroutine

Purpose

Computes a constant times a vector plus a vector.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SAXPY (N,A,X,INCX,Y,INCY)
INTEGER INCX, INCY, N
REAL A
REAL X(*), Y(*)
SUBROUTINE DAXPY (N,A,X,INCX,Y,INCY)
INTEGER INCX, INCY, N
DOUBLE PRECISION A
DOUBLE PRECISION X(*), Y(*)
SUBROUTINE CAXPY (N,A,X,INCX,Y,INCY)
INTEGER INCX, INCY, N
COMPLEX A
COMPLEX X(*), Y(*)
SUBROUTINE ZAXPY (N,A,X,INCX,Y,INCY)
INTEGER INCX, INCY, N
COMPLEX*16 A
COMPLEX*16 X(*), Y(*)
```

Description

The SAXPY, DAXPY, CAXPY, or ZAXPY subroutine computes a constant times a vector plus a vector:

```
Y = A * X + Y
```

Parameters

```
Ν
         On entry, N specifies the number of elements in X and Y; unchanged on exit.
         On entry, A contains a constant to be multiplied by the X vector; unchanged on exit.
Α
X
         Vector of dimension at least (1 + (N-1) * abs(INCX) ); unchanged on exit.
INCX
         On entry, INCX specifies the increment for the elements of X; unchanged on exit.
         Vector of dimension at least (1 + (N-1) * abs(INCY)); the result is returned in vector Y.
         On entry, INCY specifies the increment for the elements of Y; unchanged on exit.
```

Error Codes

If SA = 0 or $N \le 0$, the subroutine returns immediately.

SROTG, DROTG, CROTG, or ZROTG Subroutine

Purpose

Constructs Givens plane rotation.

Library

```
SUBROUTINE SROTG (A,B,C,S)
REAL A, B, C, S
SUBROUTINE DROTG (A, B, C, S)
DOUBLE PRECISION A,B,C,S
SUBROUTINE CROTG (A, B, C, S)
REAL C
COMPLEX A, B, S
SUBROUTINE ZROTG (A,B,C,S)
DOUBLE PRECISION \mathcal C
COMPLEX*16 A,B,S
```

Description

Given vectors A and B, the SROTG, DROTG, CROTG, or ZROTG subroutine computes:

The numbers C, S, and r then satisfy the matrix equation:

The subroutines also compute:

$$z = \left\{ \begin{array}{l} S & \text{if } |A| > |B|, \\ 1/C & \text{if } |B| > = |A| \text{ and } C \text{ not } = 0, \\ 1 & \text{if } C = 0. \end{array} \right.$$

The subroutines return *r* overwriting *A* and *z* overwriting *B*, as well as returning *C* and *S*.

Parameters

- Α On entry, contains a scalar constant; on exit, contains the value r.
- В On entry, contains a scalar constant; on exit, contains the value z.
- CCan contain any value on entry; the value C returned on exit.
- S Can contain any value on entry; the value S returned on exit.

SROT, DROT, CSROT, or ZDROT Subroutine

Purpose

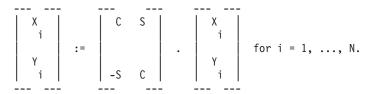

Applies a plane rotation.

Library

```
SUBROUTINE SROT (N, X, INCX, Y, INCY, C, S)
INTEGER INCX, INCY, N
REAL C, S
REAL X(*), Y(*)
SUBROUTINE DROT (N, X, INCX, Y, INCY, C, S)
INTEGER INCX, INCY, N
DOUBLE PRECISION C,S
DOUBLE PRECISION X(*), Y(*)
SUBROUTINE CSROT (N, X, INCX, Y, INCY, C, S)
INTEGER INCX, INCY, N
REAL C,S
COMPLEX X(*), Y(*)
SUBROUTINE ZDROT (N,X,INCX,Y,INCY,C,S)
INTEGER INCX, INCY, N
DOUBLE PRECISION C.S
COMPLEX*16 X(*), Y(*)
```

Description

The SROT, DROT, CSROT, or ZDROT subroutine computes:

The subroutines return the modified *X* and *Y*.

Parameters

Ν On entry, N specifies the number of elements in X and Y; unchanged on exit. X Vector of dimension at least (1 + (N-1) * abs (INCX)); unchanged on exit. **INCX** On entry, INCX specifies the increment for the elements of X; unchanged on exit. Y Vector of dimension at least (1 + (N-1) * abs(INCY)); modified on exit. **INCY** On entry, INCY specifies the increment for the elements of Y; unchanged on exit. Scalar constant; unchanged on exit. CS Scalar constant; unchanged on exit.

Error Codes

If $N \le 0$, or if C = 1 and S = 0, the subroutines return immediately.

SCOPY, DCOPY, CCOPY, or ZCOPY Subroutine

Purpose

Copies vector X to Y.

Library

SUBROUTINE SCOPY (N,X,INCX,Y,INCY)
INTEGER INCX, INCY, N

REAL X(*), Y(*)

SUBROUTINE DCOPY (N,X,INCX,Y,INCY)
INTEGER INCX,INCY,N

DOUBLE PRECISION X(*),Y(*)

SUBROUTINE CCOPY (N,X,INCX,Y,INCY)
INTEGER INCX,INCY,N

COMPLEX X(*),Y(*)

SUBROUTINE ZCOPY (N,X,INCX,Y,INCY)
INTEGER INCX,INCY,N

COMPLEX*16 X(*),Y(*)

Description

The **SCOPY**, **DCOPY**, **CCOPY**, or **ZCOPY** subroutine copies vector *X* to vector *Y*.

Parameters

N On entry, N specifies the number of elements in X and Y; unchanged on exit. X Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; unchanged on exit.

Y Vector of dimension at least (1 + (N-1) * abs(INCY)) or greater; can contain any values on entry; on exit,

contains the same values as X.

INCY On entry, INCY specifies the increment for the elements of Y; unchanged on exit.

Error Codes

For values of $N \le 0$, the subroutines return immediately.

SSWAP, DSWAP, CSWAP, or ZSWAP Subroutine

Purpose

Interchanges vectors X and Y.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE SSWAP (N,X,INCX,Y,INCY)
INTEGER INCX, INCY, N
REAL X(*), Y(*)
SUBROUTINE DSWAP (N,X,INCX,Y,INCY)
INTEGER INCX,INCY,N
DOUBLE PRECISION X(*),Y(*)
SUBROUTINE CSWAP (N,X,INCX,Y,INCY)
INTEGER INCX,INCY,N
COMPLEX X(*),Y(*)
SUBROUTINE ZSWAP (N,X,INCX,Y,INCY)
INTEGER INCX,INCY,N
COMPLEX*16 X(*),Y(*)

The SSWAP, DSWAP, CSWAP, or ZSWAP subroutine interchanges vector X and vector Y.

Parameters

Ν On entry, *N* specifies the number of elements in *X* and *Y*; unchanged on exit.

Vector of dimension at least (1 + (N-1) * abs(INCX)); on exit, contains the elements of vector Y.

INCX On entry, INCX specifies the increment for the elements of X; unchanged on exit.

Y Vector of dimension at least (1 + (N-1) * abs(INCY)); on exit, contains the elements of vector X.

INCY On entry, INCY specifies the increment for the elements of Y; unchanged on exit.

Error Codes

For values of $N \le 0$, the subroutines return immediately.

SNRM2, DNRM2, SCNRM2, or DZNRM2 Function

Purpose

Computes the Euclidean length of the N-vector stored in X() with storage increment INCX.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

REAL FUNCTION SNRM2 (N,X,INCX) INTEGER *INCX*, *N* REAL X(*)DOUBLE PRECISION FUNCTION DNRM2 (N, X, INCX) **INTEGER** INCX, N DOUBLE PRECISION X(*)**REAL FUNCTION SCNRM2 (N,X,INCX)** INTEGER INCX.N COMPLEX X(*)DOUBLE PRECISION FUNCTION DZNRM2 (N,X,INCX) **INTEGER** INCX,N COMPLEX*16 X(*)

Description

The SNRM2, DNRM2, SCNRM2, or DZNRM2 function returns the Euclidean norm of the N-vector stored in X() with storage increment INCX.

Parameters

On entry, N specifies the number of elements in X and Y; unchanged on exit.

Χ Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must be greater than 0; unchanged on exit.

Error Codes

For values of $N \le 0$, a value of 0 is returned.

SASUM, DASUM, SCASUM, or DZASUM Function

Purpose

Returns the sum of absolute values of vector components.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
REAL FUNCTION SASUM(N,X,INCX)
INTEGER INCX, N
REAL X(*)
DOUBLE PRECISION FUNCTION DASUM(N,X,INCX)
INTEGER INCX,N
DOUBLE PRECISION X(*)
REAL FUNCTION SCASUM(N,X,INCX)
INTEGER INCX,N
COMPLEX X(*)
DOUBLE PRECISION FUNCTION DZASUM(N,X,INCX)
INTEGER INCX,N
COMPLEX*16 X(*)
```

Description

The SASUM, DASUM, SCASUM, or DZASUM function returns the sum of absolute values of vector components.

Parameters

Ν On entry, N specifies the number of elements in X and Y; unchanged on exit. Χ Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must be greater than 0; unchanged on

exit.

Error Codes

For values of $N \le 0$, a value of 0 is returned.

SSCAL, DSCAL, CSSCAL, CSCAL, ZDSCAL, or ZSCAL Subroutine

Purpose

Scales a vector by a constant.

Library

SUBROUTINE SSCAL (N,A,X,INCX) INTEGER INCX, N **REAL** A REAL X(*)SUBROUTINE DSCAL (N,A,X,INCX) **INTEGER** INCX, N **DOUBLE PRECISION** A DOUBLE PRECISION X(*)SUBROUTINE CSSCAL (N,A,X,INCX)**INTEGER** *INCX*, N REAL A COMPLEX X(*)SUBROUTINE CSCAL **INTEGER** INCX,N COMPLEX A COMPLEX X(*)SUBROUTINE ZDSCAL **INTEGER** INCX, N **DOUBLE PRECISION** A COMPLEX*16 X(*)SUBROUTINE ZSCAL(INTEGER INCX, N COMPLEX*16 A COMPLEX*16 X(*)

Description

The SSCAL, DSCAL, CSCAL, CSCAL, ZDSCAL, or ZSCAL subroutine scales a vector by a constant: X := X * A

Parameters

- Ν On entry, N specifies the number of elements in X and Y; unchanged on exit.
- Α Scaling constant; unchanged on exit.
- Χ Vector of dimension at least (1 + (N-1) * abs(INCX)); on exit, contains the scaled vector.
- INCX On entry, INCX specifies the increment for the elements of X; INCX must be greater than 0; unchanged on

Error Codes

For values of $N \le 0$, the subroutines return immediately.

ISAMAX, IDAMAX, ICAMAX, or IZAMAX Function

Purpose

Finds the index of element having maximum absolute value.

Library

INTEGER FUNCTION ISAMAX (N, X, INCX)
INTEGER INCX, N

REAL X(*)
INTEGER FUNCTION IDAMAX (N, X, INCX)
INTEGER INCX, N
DOUBLE PRECISION X(*)
INTEGER FUNCTION ICAMAX (N, X, INCX)
INTEGER INCX, N
COMPLEX X(*)
INTEGER FUNCTION IZAMAX (N, X, INCX)
INTEGER INCX, N
COMPLEX*16 X(*)

Description

The ISAMAX, IDAMAX, ICAMAX, or IZAMAX function returns the index of element having maximum absolute value.

Parameters

N On entry, N specifies the number of elements in X and Y; unchanged on exit.

X Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; unchanged on exit.

Error Codes

For values of $N \le 0$, a value of 0 is returned.

SDSDOT Function

Purpose

Returns the dot product of two vectors plus a constant.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

REAL FUNCTION SDSDOT(N,B,X,INCX,Y,INCY)
INTEGER N, INCX, INCY
REAL B, X(*), Y(*)

Purpose

The **SDSDOT** function computes the sum of constant B and dot product of vectors X and Y.

Note: Computation is performed in double precision.

Parameters

- N On entry, N specifies the number of elements in X and Y; unchanged on exit.
- B Scalar; unchanged on exit.
- X Vector of dimension at least (1 + (N-1) * abs(INCX)); unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must be greater than zero; unchanged

Y Vector of dimension at least (1 + (N-1) * abs(INCY)); unchanged on exit.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must be greater than 0; unchanged on

Error Codes

For values of $N \le 0$, the subroutine returns immediately.

SROTM or DROTM Subroutine

Purpose

Applies the modified Givens transformation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SROTM(N,X,INCX,Y,INCY,PARAM)
INTEGER N, INCX, INCY
REAL X(*), Y(*), PARAM(5)
SUBROUTINE DROTM(N,X,INCX,Y,INCY,PARAM)
INTEGER N, INCX, INCY
DOUBLE PRECISION X(*), Y(*), PARAM(5)
```

Description

Let H denote the modified Givens transformation defined by the parameter array PARAM. The SROTM or **DROTM** subroutine computes:

where H is a 2 x 2 matrix with the components defined by the elements of the array PARAM as follows:

```
if PARAM(1) == 0.0
  H(1,1) = H(2,2) = 1.0
  H(2,1) = PARAM(3)
  H(1,2) = PARAM(4)
if PARAM(1) == 1.0
  H(1,2) = H(2,1) = -1.0
  H(1,1) = PARAM(2)
  H(2,2) = PARAM(5)
if PARAM(1) == -1.0
  H(1,1) = PARAM(2)
  H(2,1) = PARAM(3)
  H(1,2) = PARAM(4)
  H(2,2) = PARAM(5)
if PARAM(1) == -2.0
  H = I (Identity matrix)
```

If $N \le 0$ or H is an identity matrix, the subroutines return immediately.

Parameters

Ν On entry, N specifies the number of elements in X and Y; unchanged on exit.

Χ Vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on exit, modified as described above.

INCX On entry, INCX specifies the increment for the elements of X; INCX must be greater than 0; unchanged on

Vector of dimension at least (1 + (N-1) * abs(INCY)); on exit, modified as described above.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must be greater than 0; unchanged on

PARAM Vector of dimension (5); on entry, must be set as described above. Specifically, PARAM(1) is a flag and

must have value of either 0.0, -1.0, 1.0, or 2.0; unchanged on exit.

Related information

The **SROTMG** or **DROTMG** ("SROTMG or DROTMG Subroutine") subroutine builds the *PARAM* array prior to use by the **SROTM** or **DROTM** subroutine.

SROTMG or DROTMG Subroutine

Purpose

Constructs a modified Givens transformation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE SROTMG (D1, D2, X1, X2, PARAM) **REAL** D1, D2, X1, X2, PARAM(5) **SUBROUTINE DROTMG (D1, D2, X1, X2, PARAM) DOUBLE PRECISION** D1, D2, X1, X2, PARAM(5)

Description

The SROTMG or DROTMG subroutine constructs a modified Givens transformation. The input quantities D1, D2, X1, and X2 define a 2-vector in partitioned form:

The subroutines determine the modified Givens rotation matrix H that transforms X2 and, thus, a2 to 0. A representation of this matrix is stored in the array *PARAM* as follows:

```
Case 1: PARAM(1) = 1.0
  PARAM(2) = H(1,1)
   PARAM(5) = H(2,2)
Case 2: PARAM(1) = 0.0
  PARAM(3) = H(2,1)
  PARAM(4) = H(1,2)
Case 3: PARAM(1) = -1.0
   H(1,1) = PARAM(2)
  H(2,1) = PARAM(3)
  H(1,2) = PARAM(4)
  H(2,2) = PARAM(5)
```

```
Case 4: PARAM(1) = -2.0
  H = I (Identity matrix)
```

Note: Locations in *PARAM* not listed are left unchanged.

Parameters

D1 Nonnegative scalar; modified on exit to reflect the results of the transformation.

D2 Scalar; can be negative on entry; modified on exit to reflect the results of the transformation.

X1 Scalar; modified on exit to reflect the results of the transformation.

X2 Scalar; unchanged on exit.

PARAM Vector of dimension (5); values on entry are unused; modified on exit as described above.

Related Information

The **SROTM** and **DROTM** ("SROTM or DROTM Subroutine" on page 749) subroutines apply the Modified Givens Transformation.

SGEMV, DGEMV, CGEMV, or ZGEMV Subroutine

Purpose

Performs matrix-vector operation with general matrices.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SGEMV (TRANS, M, N, ALPHA, A, LDA, X,
INCX, BETA, Y, INCY)
REAL ALPHA, BETA
INTEGER INCX, INCY, LDA, M, N
CHARACTER*1 TRANS
REAL A(LDA,*), X(*), Y(*)
SUBROUTINE DGEMV (TRANS, M, N, ALPHA, A, LDA, X,
INCX, BETA, Y, INCY)
DOUBLE PRECISION ALPHA, BETA
INTEGER INCX, INCY, LDA, M, N
CHARACTER*1 TRANS
DOUBLE PRECISION A(LDA,*), X(*), Y(*)
SUBROUTINE CGEMV (TRANS, M, N, ALPHA, A, LDA, X,
INCX, BETA, Y, INCY)
COMPLEX ALPHA, BETA
INTEGER INCX, INCY, LDA, M, N
CHARACTER*1 TRANS
COMPLEX A(LDA,*), X(*), Y(*)
SUBROUTINE ZGEMV (TRANS, M, N, ALPHA, A, LDA, X,
INCX, BETA, Y, INCY)
COMPLEX*16 ALPHA, BETA
INTEGER INCX,INCY,LDA,M,N
CHARACTER*1 TRANS
COMPLEX*16 A(LDA,*), X(*), Y(*)
```

The SGEMV, DGEMV, CGEMV, or ZGEMV subroutine performs one of the following matrix-vector operations:

```
y := alpha * A * x + beta * y
OR
y := alpha * A' * x + beta * y
```

where alpha and beta are scalars, x and y are vectors, and A is an M by N matrix.

Parameters

TRANS On entry, TRANS specifies the operation to be performed as follows:

```
TRANS = 'N' \text{ or 'n'}
         y := alpha * A * x + beta * y
TRANS = T' or T'
         y := alpha * A' * x + beta * y
TRANS = 'C' \text{ or 'c'}
         y := alpha * A' * x + beta * y
```

Unchanged on exit.

Μ On entry, M specifies the number of rows of the matrix A; M must be at least 0; unchanged on exit. Ν On entry, N specifies the number of columns of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, N); on entry, the leading M by N part of the array A must contain the matrix Α of coefficients; unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, M); unchanged on exit.

Χ A vector of dimension at least (1 + (N-1) * abs(INCX)) when TRANS = 'N' or 'n', otherwise, at least (1 + (M-1) * abs(INCX)); on entry, the incremented array X must contain the vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

BETA On entry, BETA specifies the scalar beta; when BETA is supplied as 0, Y need not be set on input;

unchanged on exit.

A vector of dimension at least 1 + (M-1) * abs(INCY)) when TRANS = N or 'n', otherwise at least (1 + M-1)(N-1) * abs(INCY)); on entry, with BETA nonzero, the incremented array Y must contain the vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

SGBMV, DGBMV, CGBMV, or ZGBMV Subroutine

Purpose

Performs matrix-vector operations with general banded matrices.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SGBMV (TRANS, M, N, KL, KU, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
REAL ALPHA, BETA
```

```
INTEGER INCX, INCY, KL, KU, LDA, M, N
CHARACTER*1 TRANS
REAL A(LDA,*), X(*), Y(*)
SUBROUTINE DGBMV (TRANS, M, N, KL, KU, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
DOUBLE PRECISION ALPHA, BETA
INTEGER INCX, INCY, KL, KU, LDA, M, N
CHARACTER*1 TRANS
DOUBLE PRECISION A(LDA,*), X(*), Y(*)
SUBROUTINE CGBMV (TRANS, M, N, KL, KU, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
COMPLEX ALPHA, BETA
INTEGER INCX, INCY, KL, KU, LDA, M, N
CHARACTER*1 TRANS
COMPLEX A(LDA,*), X(*), Y(*)
SUBROUTINE ZGBMV (TRANS, M, N, KL, KU, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
COMPLEX*16 ALPHA, BETA
INTEGER INCX, INCY, KL, KU, LDA, M, N
CHARACTER*1 TRANS
COMPLEX*16 A(LDA,*), X(*), Y(*)
```

The SGBMV, DGBMV, CGBMV, or ZGBMV subroutine performs one of the following matrix-vector operations:

```
y := alpha * A * x + beta * y
OR
y := alpha * A' * x + beta * y
```

where alpha and beta are scalars, x and y are vectors and A is an M by N band matrix, with KL subdiagonals and KU superdiagonals.

Parameters

TRANS On entry, TRANS specifies the operation to be performed as follows:

```
TRANS = 'N' \text{ or 'n'}
         y := alpha * A * x + beta * y
TRANS = 'T' or 't'
         y := alpha * A' * x + beta * y
TRANS = 'C' \text{ or 'c'}
         y := alpha * A' * x + beta * y
```

Unchanged on exit.

Μ On entry, M specifies the number of rows of the matrix A; M must be at least 0; unchanged on exit.

On entry, N specifies the number of columns of the matrix A; N must be at least 0; unchanged on exit. Ν

KL On entry, KL specifies the number of subdiagonals of the matrix A; KL must satisfy 0 .le. KL; unchanged on exit.

KU On entry, KU specifies the number of superdiagonals of the matrix A; KU must satisfy 0 .le. KU; unchanged

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit. Α A vector of dimension (LDA, N); on entry, the leading (KL + KU + 1) by N part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (KU + 1) of the array, the first superdiagonal starting at position 2 in row KU, the first subdiagonal starting at position 1 in row (KU + 2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left KU by KU triangle) are not referenced. The following program segment transfers a band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N
   K = KU + 1 - J
   DO 10, I = MAX( 1, J - KU ), MIN( M, J + KL )
     A(K + I, J) = matrix(I, J)
10 CONTINUE
20 CONTINUE
```

Unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. LDA must be at least (KL + KU + 1); unchanged on exit.

Χ A vector of dimension at least (1 + (N-1) * abs(INCX)) when TRANS = 'N' or 'n', otherwise, at least (1 + (M-1) * abs(INCX)); on entry, the incremented array X must contain the vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

On entry, BETA specifies the scalar beta; when BETA is supplied as 0 then Y need not be set on input; **BETA** unchanged on exit.

Y A vector of dimension at least $(1 + (M-1))^*$ abs(INCY)) when TRANS = 'N' or 'n', otherwise, at least $(1 + (M-1))^*$ (N-1) * abs(INCY)); on entry, the incremented array Y must contain the vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

CHEMV or ZHEMV Subroutine

Purpose

Performs matrix-vector operations using Hermitian matrices.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE CHEMV (UPLO, N, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
COMPLEX ALPHA, BETA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
COMPLEX A(LDA,*), X(*), Y(*)
SUBROUTINE ZHEMV (UPLO, N, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
COMPLEX*16 ALPHA, BETA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
COMPLEX*16 A(LDA,*), X(*), Y(*)
```

Description

The CHEMV or ZHEMV subroutine performs the matrix-vector operation:

```
y := alpha * A * x + beta * y
```

where alpha and beta are scalars, x and y are N element vectors and A is an N by N Hermitian matrix.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of A is to be referenced; unchanged on exit.

UPLO = 'L' or 'l'

Only the lower triangular part of A is to be referenced; unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of A is not referenced; on entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of A is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be 0; unchanged on exit.

On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at LDA least max(1, N); unchanged on exit.

X A vector of dimension at least (1 + (N-1) * abs(INCX)); on entry, the incremented array X must contain the N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

BETA On entry, BETA specifies the scalar beta; when BETA is supplied as 0 then Y need not be set on input; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCY))$; on entry, the incremented array Y must contain

the N element vector y; on exit, Y is overwritten by the updated vector y. INCY On entry, INCY specifies the increment for the elements of Y: INCY must not be 0; unchanged on exit.

CHBMV or ZHBMV Subroutine

Purpose

Performs matrix-vector operations using a Hermitian band matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE CHBMV (UPLO, N, K, ALPHA, A, LDA, X, INCX, BETA, Y, INCY) **COMPLEX** ALPHA, BETA INTEGER INCX, INCY, K, LDA, N CHARACTER*1 UPLO COMPLEX A(LDA,*), X(*), Y(*)SUBROUTINE ZHBMV (UPLO, N, K, ALPHA, A, LDA, X, INCX, BETA, Y, INCY) COMPLEX*16 ALPHA, BETA INTEGER INCX, INCY, K, LDA, N CHARACTER*1 UPLO COMPLEX*16 A(LDA,*), X(*), Y(*)

Description

The **CHBMV** or **ZHBMV** subroutine performs the matrix-vector operation:

```
y := alpha * A * x + beta * y
```

where alpha and beta are scalars, x and y are N element vectors, and A is an N by N Hermitian band matrix with K superdiagonals.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the band matrix A is being supplied as follows:

UPLO = 'U' or 'u'

The upper triangular part of A is being supplied.

UPLO = 'L' or 'l'

The lower triangular part of *A* is being supplied.

Unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

K On entry, K specifies the number of superdiagonals of the matrix A; K must satisfy 0 .le. K; unchanged on

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, N). On entry with UPLO = 'U' or 'u', the leading (K + 1) by N part of the Α array A must contain the upper triangular band part of the Hermitian matrix, supplied column by column, with the leading diagonal of the matrix in row (K + 1) of the array, the first superdiagonal starting at position 2 in row K, and so on. The top left K by K triangle of the array A is not referenced. The following program segment transfers the upper triangular part of a Hermitian band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N
   M = K + 1 - J
   DO 10, I = MAX(1, J - K), J
        A(M + I, J) = matrix(I, J)
10 CONTINUE
20 CONTINUE
```

Note: On entry with UPLO = 'L' or 'i', the leading (K + 1) by N part of the array A must contain the lower triangular band part of the Hermitian matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first subdiagonal starting at position 1 in row 2, and so on. The bottom right K by K triangle of the array A is not referenced. The following program segment transfers the lower triangular part of a Hermitian band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N
  M = 1 - J
  DO 10, I = J, MIN(N, J + K)
       A(M+I,J) = matrix(I,J)
10 CONTINUE
20 CONTINUE
```

The imaginary parts of the diagonal elements need not be set and are assumed to be 0. Unchanged on

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least (K + 1); unchanged on exit.

X A vector of dimension at least (1 + (N-1)) * abs(INCX)); on entry, the incremented array X must contain the vector x: unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0 unchanged on exit.

BETA On entry, BETA specifies the scalar beta unchanged on exit.

Y A vector of dimension at least (1 + (N-1) * abs(INCY)); on entry, the incremented array Y must contain the vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

CHPMV or ZHPMV Subroutine

Purpose

Performs matrix-vector operations using a packed Hermitian matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE CHPMV (UPLO, N, ALPHA, AP, X,
INCX, BETA, Y, INCY)
COMPLEX ALPHA, BETA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
COMPLEX AP(*), X(*), Y(*)
SUBROUTINE ZHPMV
COMPLEX*16 ALPHA, BETA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
COMPLEX*16 AP(*), X(*), Y(*)
```

Description

The **CHPMV** or **ZHPMV** subroutine performs the matrix-vector operation:

```
y := alpha * A * x + beta * y
```

where alpha and beta are scalars, x and y are N element vectors and A is an N by N Hermitian matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array AP as follows:

```
UPLO = 'U' \text{ or 'u'}
          The upper triangular part of A is supplied in AP.
UPLO = 'L' \text{ or 'I'}
```

The lower triangular part of A is supplied in AP.

Unchanged on exit.

N On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least ((N * (N+1))/2); on entry with UPLO = 'U' or 'u', the array AP must contain AP the upper triangular part of the Hermitian matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on; on entry with UPLO ='L' or 'l', the array AP must contain the lower triangular part of the Hermitian matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. The imaginary parts of the diagonal elements need not be set and are assumed to be 0; unchanged on exit.

Χ A vector of dimension at least $(1 + (N-1))^*$ abs(INCX); on entry, the incremented array X must contain the N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit. **BETA** On entry, BETA specifies the scalar beta; when BETA is supplied as 0 then Y need not be set on input; unchanged on exit.

Υ A vector of dimension at least (1 + (N-1) * abs(INCY)); on entry, the incremented array Y must contain the N element vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

SSYMV or DSYMV Subroutine

Purpose

Performs matrix-vector operations using a symmetric matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSYMV (UPLO, N, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
REAL ALPHA, BETA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
REAL A(LDA,*), X(*), Y(*)
SUBROUTINE DSYMV (UPLO, N, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
DOUBLE PRECISION ALPHA, BETA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
DOUBLE PRECISION A(LDA,*), X(*), Y(*)
```

Description

The **SSYMV** or **DSYMV** subroutine performs the matrix-vector operation:

```
y := alpha * A * x + beta * y
```

where alpha and beta are scalars, x and y are N element vectors and A is an N by N symmetric matrix.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of A is to be referenced.

Only the lower triangular part of A is to be referenced.

Unchanged on exit.

On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the symmetric matrix; the strictly lower triangular part of A is not referenced; on entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the symmetric matrix; the strictly upper triangular part of A is not referenced; unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, N); unchanged on exit.

Α

X	A vector of dimension at least $(1 + (N-1)^{\circ})$ abs (NCX) ; on entry, the incremented array X must contain
	the N element vector x; unchanged on exit.
INCX	On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.
BETA	On entry, BETA specifies the scalar beta; when BETA is supplied as 0 then Y need not be set on input;
	unchanged on exit.

A vector of dimension at least (1 + (N-1) * abs(INCY)); on entry, the incremented array Y must contain the N element vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

SSBMV or DSBMV Subroutine

Purpose

Performs matrix-vector operations using symmetric band matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSBMV (UPLO, N, K, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
REAL ALPHA, BETA
INTEGER INCX, INCY, K, LDA, N
CHARACTER*1 UPLO
REAL A(LDA,*), X(*), Y(*)
SUBROUTINE DSBMV (UPLO, N, K, ALPHA, A, LDA,
X, INCX, BETA, Y, INCY)
DOUBLE PRECISION ALPHA, BETA
INTEGER INCX, INCY, K, LDA, N
CHARACTER*1 UPLO
DOUBLE PRECISION A(LDA,*), X(*), Y(*)
```

Description

The **SSBMV** or **DSBMV** subroutine performs the matrix-vector operation:

```
y := alpha * A * x + beta * y
```

where alpha and beta are scalars, x and y are N element vectors, and A is an N by N symmetric band matrix with K super-diagonals.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the band matrix A is being supplied as follows:

```
UPLO = 'U' \text{ or 'u'}
```

The upper triangular part of A is being supplied.

$$UPLO = 'L' \text{ or 'l'}$$

The lower triangular part of A is being supplied.

Unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

K On entry, K specifies the number of superdiagonals of the matrix A; K must satisfy 0 .le. K; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading (K + 1) by N part of the Α array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (K + 1) of the array, the first superdiagonal starting at position 2 in row K, and so on. The top left K by K triangle of the array A is not referenced. The following program segment transfers the upper triangular part of a symmetric band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N
     M = K + 1 - J
     DO 10, I = MAX(1, J - K), J
           A(M + I, J) = matrix(I, J)
10 CONTINUE
20 CONTINUE
```

On entry with UPLO = L' or l', the leading (K + 1) by N part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first subdiagonal starting at position 1 in row 2, and so on. The bottom right K by K triangle of the array A is not referenced. The following program segment transfers the lower triangular part of a symmetric band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N
     M = 1 - J
     DO 10, I = J, MIN(N, J + K)
          A(M + I, J) = matrix(I, J)
10 CONTINUE
20 CONTINUE
```

Unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least (K + 1); unchanged on exit.

Χ A vector of dimension at least (1 + (N-1) * abs(INCX)); on entry, the incremented array X must contain the vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

BETA On entry, BETA specifies the scalar beta; unchanged on exit.

A vector of dimension at least (1 + (N-1) * abs(INCY)); on entry, the incremented array Y must contain Y the vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

SSPMV or DSPMV Subroutine

Purpose

Performs matrix-vector operations using a packed symmetric matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSPMV (UPLO, N, ALPHA, AP, X,
INCX, BETA, Y, INCY)
REAL ALPHA, BETA
INTEGER INCX. INCY. N
CHARACTER*1 UPLO
REAL AP(*), X(*), Y(*)
```

```
SUBROUTINE DSPMV (UPLO, N, ALPHA, AP, X,
INCX, BETA, Y, INCY)
DOUBLE PRECISION ALPHA, BETA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
DOUBLE PRECISION AP(*), X(*), Y(*)
```

The **SSPMV** or **DSPMV** subroutine performs the matrix-vector operation:

```
y := alpha * A * x + beta * y
```

where alpha and beta are scalars, x and y are N element vectors and A is an N by N symmetric matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array AP as follows:

UPLO = 'U' or 'u'

The upper triangular part of A is supplied in AP.

UPLO = 'L' or 'l'

The lower triangular part of A is supplied in AP.

Unchanged on exit.

On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least ((N * (N+1))/2); on entry with UPLO = 'U' or 'u', the array AP must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on; on entry with UPLO ='L' or 'l', the array AP must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on; unchanged on exit.

Χ A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit. On entry, BETA specifies the scalar beta; when BETA is supplied as 0 then Y need not be set on input; BETA unchanged on exit.

Y A vector of dimension at least $(1 + (N-1)^* abs(INCY))$; on entry, the incremented array Y must contain the N element vector y; on exit, Y is overwritten by the updated vector y.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

STRMV, DTRMV, CTRMV, or ZTRMV Subroutine

Purpose

Performs matrix-vector operations using a triangular matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE STRMV (UPLO, TRANS, DIAG, N, A, LDA, X, INCX)

```
INTEGER INCX, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
REAL A(LDA,*), X(*)
SUBROUTINE DTRMV (UPLO, TRANS, DIAG, N,
A, LDA, X, INCX)
INTEGER INCX, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
DOUBLE PRECISION A(LDA,*), X(*)
SUBROUTINE CTRMV (UPLO, TRANS, DIAG, N,
A, LDA, X, INCX)
INTEGER INCX, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX A(LDA,*), X(*)
SUBROUTINE ZTRMV (UPLO, TRANS, DIAG, N,
A, LDA, X, INCX)
INTEGER INCX, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX*16 A(LDA,*),X(*)
```

The STRMV, DTRMV, CTRMV, or ZTRMV subroutine performs one of the matrix-vector operations:

```
x := A * x
OR
x := A' * x
```

where x is an N element vector and A is an N by N unit, or non-unit, upper or lower triangular matrix.

Parameters

```
UPLO
           On entry, UPLO specifies whether the matrix is an upper or lower triangular matrix as follows:
```

UPLO = 'U' or 'u'A is an upper triangular matrix.

UPLO = 'L' or 'l'

A is a lower triangular matrix.

Unchanged on exit.

TRANS On entry, TRANS specifies the operation to be performed as follows:

> TRANS = 'N' or 'n' x := A * xTRANS = 'T' or 't' x := A' * xTRANS = 'C' or 'c'x := A' * x

Unchanged on exit.

DIAG On entry, *DIAG* specifies whether or not *A* is unit triangular as follows:

DIAG = 'U' or 'u'

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

- Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit. An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part Α of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced; on entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must
 - contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. When DIAG = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity; unchanged on exit.
- On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. LDA must be at LDA least max(1, N); unchanged on exit.
- Χ A vector of dimension at least $(1 + (N-1))^*$ abs(INCX)). On entry, the incremented array X must contain the N element vector x; on exit, X is overwritten with the transformed vector x.
- **INCX** On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

STBMV, DTBMV, CTBMV, or ZTBMV Subroutine

Purpose

Performs matrix-vector operations using a triangular band matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE STBMV (UPLO, TRANS, DIAG, N,
K, A, LDA, X, INCX)
INTEGER INCX, K, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
REAL A(LDA,*), X(*)
SUBROUTINE DTBMV (UPLO, TRANS, DIAG, N,
K, A, LDA, X, INCX)
INTEGER INCX,K,LDA,N
CHARACTER*1 DIAG, TRANS, UPLO
DOUBLE PRECISION A(LDA,*), X(*)
SUBROUTINE CTBMV (UPLO, TRANS, DIAG, N,
K, A, LDA, X, INCX)
INTEGER INCX, K, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX A(LDA,*), X(*)
SUBROUTINE ZTBMV (UPLO, TRANS, DIAG, N,
K, A, LDA, X, INCX)
INTEGER INCX,K,LDA,N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX*16 A(LDA,*), X(*)
```

Description

The STBMV, DTBMV, CTBMV, or ZTBMV subroutine performs one of the matrix-vector operations:

```
x := A * x
OR
x := A' * x
```

where x is an N element vector and A is an N by N unit, or non-unit, upper or lower triangular band matrix, with (K + 1) diagonals.

Parameters

UPLO On entry, UPLO specifies whether the matrix is an upper or lower triangular matrix as follows:

UPLO = 'U' or 'u'

A is an upper triangular matrix.

UPLO = 'L' or 'l'

A is a lower triangular matrix.

Unchanged on exit.

TRANS On entry, TRANS specifies the operation to be performed as follows:

$$TRANS =$$
'N' or 'n' $\times := A * \times$
 $TRANS =$ 'T' or 't' $\times := A' * \times$
 $TRANS =$ 'C' or 'c' $\times := A' * \times$

Unchanged on exit.

DIAG On entry, DIAG specifies whether or not A is unit triangular as follows:

DIAG = 'U' or 'u'

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

N On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

On entry with UPLO = 'U' or 'u', K specifies the number of superdiagonals of the matrix A; on entry with UPLO = 'L' or 'l', K specifies the number of subdiagonals of the matrix A. K must satisfy 0 .le. K; unchanged on exit.

An array of dimension (LDA, N). On entry with UPLO = 'U' or 'u', the leading (K+1) by N part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (K+1) of the array, the first superdiagonal starting at position 2 in row K, and so on. The top left K by K triangle of the array A is not referenced. The following program segment will transfer an upper triangular band matrix from conventional full matrix storage to band storage:

```
DO 20, J = 1, N

M = K + 1 - J

DO 10, I = MAX( 1, J - K ), J

A( M + I, J ) = matrix( I, J )

10 CONTINUE

20 CONTINUE

DO 20, J = 1, N

M = 1 - J

DO 10, I = J, MIN( N, J + K )

A( M + I, J ) = matrix( I, J )

10 CONTINUE

20 CONTINUE
```

On entry with UPLO = 'L' or 'l', the leading (K + 1) by N part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first subdiagonal starting at position 1 in row 2, and so on. The bottom right K by K triangle of the array A is not referenced. The following program segment will transfer a lower triangular band matrix from conventional full matrix storage to band storage:

When DIAG = 'U' or 'u' the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity; unchanged on exit.

- LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least (K + 1); unchanged on exit.
- Χ A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the *N* element vector x; on exit, *X* is overwritten with the transformed vector x.
- INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

STPMV, DTPMV, CTPMV, or ZTPMV Subroutine

Purpose

Performs matrix-vector operations on a packed triangular matrix.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE STPMV (UPLO, TRANS, DIAG,
N, AP, X, INCX)
INTEGER INCX, N
CHARACTER*1 DIAG, TRANS, UPLO
REAL AP(*), X(*)
SUBROUTINE DTPMV (UPLO, TRANS, DIAG,
N, AP, X, INCX)
INTEGER INCX,N
CHARACTER*1 DIAG,TRANS,UPLO
DOUBLE PRECISION AP(*), X(*)
SUBROUTINE CTPMV (UPLO, TRANS, DIAG,
N, AP, X, INCX)
INTEGER INCX, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX AP(*), X(*)
SUBROUTINE ZTPMV (UPLO, TRANS, DIAG,
N, AP, X, INCX)
INTEGER INCX, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX*16 AP(*), X(*)
```

Description

The STPMV, DTPMV, CTPMV, or ZTPMV subroutine performs one of the matrix-vector operations:

```
x := A * x
OR
x := A' * x
```

where x is an N element vector and A is an N by N unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the matrix is an upper or lower triangular matrix as follows:

UPLO = 'U' or 'u'

A is an upper triangular matrix.

UPLO = 'L' or 'l'

A is a lower triangular matrix.

Unchanged on exit.

TRANS On entry, TRANS specifies the operation to be performed as follows:

> TRANS = 'N' or 'n' x := A * x

TRANS = 'T' or 't' x := A' * x

TRANS = 'C' or 'c'x := A' * x

Unchanged on exit.

DIAG On entry, *DIAG* specifies whether or not *A* is unit triangular as follows:

DIAG = 'U' or 'u'

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

APA vector of dimension at least ((N * (N+1))/2). On entry with UPLO = 'U' or 'u', the array AP must contain the upper triangular matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on. On entry with UPLO = 'L' or 'l', the array AP must contain the lower triangular matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. When DIAG = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity; unchanged on exit.

A vector of dimension at least (1 + (N-1) * abs(INCX)); on entry, the incremented array X must contain Χ the N element vector x; on exit, X is overwritten with the transformed vector x.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

STRSV, DTRSV, CTRSV, or ZTRSV Subroutine

Purpose

Solves system of equations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE STRSV (UPLO, TRANS, DIAG, N, A, LDA, X, INCX) INTEGER INCX, LDA, N CHARACTER*1 DIAG, TRANS, UPLO **REAL** A(LDA,*), X(*)

```
SUBROUTINE DTRSV (UPLO, TRANS, DIAG,
N, A, LDA, X, INCX)
INTEGER INCX,LDA,N
CHARACTER*1 DIAG, TRANS, UPLO
DOUBLE PRECISION A(LDA,*), X(*)
SUBROUTINE CTRSV (UPLO, TRANS, DIAG,
N, A, LDA, X, INCX)
INTEGER INCX, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX A(LDA,*), X(*)
SUBROUTINE ZTRSV (UPLO, TRANS, DIAG,
N, A, LDA, X, INCX)
INTEGER INCX, LDA, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX*16 A(LDA,*), X(*)
```

The STRSV, DTRSV, CTRSV, or ZTRSV subroutine solves one of the systems of equations:

A * x = b

OR

A' * x = b

where b and x are N element vectors and A is an N by N unit, or non-unit, upper or lower triangular matrix.

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

Parameters

UPLO On entry, UPLO specifies whether the matrix is an upper or lower triangular matrix as follows:

UPLO = 'U' or 'u'

A is an upper triangular matrix.

UPLO = 'L' or 'I'

A is a lower triangular matrix.

Unchanged on exit.

TRANS On entry, TRANS specifies the equations to be solved as follows:

TRANS = 'N' or 'n'

A * x = b

TRANS = 'T' or 't'

A' * x = b

TRANS = 'C' or 'c'

A' * x = b

Unchanged on exit.

DIAG On entry, DIAG specifies whether or not A is unit triangular as follows:

DIAG = 'U' or 'u'

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

N On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. On entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. When DIAG = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity; unchanged on exit

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, N); unchanged on exit.

X A vector of dimension at least (1 + (N-1) * abs(INCX)); on entry, the incremented array X must contain the N element right-hand side vector b; on exit, X is overwritten with the solution vector x.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

STBSV, DTBSV, CTBSV, or ZTBSV Subroutine

Purpose

Solves system of equations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE STBSV (UPLO, TRANS, DIAG, N, K, A, LDA, X, INCX) **INTEGER** INCX, K, LDA, N CHARACTER*1 DIAG, TRANS, UPLO **REAL** A(LDA,*), X(*)SUBROUTINE DTBSV (UPLO, TRANS, DIAG, N, K, A, LDA, X, INCX) **INTEGER** INCX,K,LDA,N CHARACTER*1 DIAG, TRANS, UPLO **DOUBLE PRECISION** A(LDA,*), X(*)SUBROUTINE CTBSV (UPLO, TRANS, DIAG, N, K, A, LDA, X, INCX) **INTEGER** INCX,K,LDA,N CHARACTER*1 DIAG, TRANS, UPLO COMPLEX A(LDA,*), X(*)SUBROUTINE ZTBSV (UPLO, TRANS, DIAG, N, K, A, LDA, X, INCX) **INTEGER** *INCX*, *K*, *LDA*, *N* CHARACTER*1 DIAG, TRANS, UPLO COMPLEX*16 A(LDA,*), X(*)

Description

The STBSV, DTBSV, CTBSV, or ZTBSV subroutine solves one of the systems of equations:

A * x = b

OR

$$A' * x = b$$

where b and x are N element vectors and A is an N by N unit, or non-unit, upper or lower triangular band matrix, with (K + 1) diagonals.

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

Parameters

UPLO On entry, UPLO specifies whether the matrix is an upper or lower triangular matrix as follows:

$$UPLO = 'U' \text{ or 'u'}$$

A is an upper triangular matrix.

A is a lower triangular matrix.

Unchanged on exit.

TRANS On entry, TRANS specifies the equations to be solved as follows:

$$A * x = b$$

$$A' * x = b$$

$$A' * x = b$$

Unchanged on exit.

DIAG On entry, *DIAG* specifies whether *A* is unit triangular as follows:

$$DIAG = 'U' \text{ or 'u'}$$

A is assumed to be unit triangular.

$$DIAG = 'N' or 'n'$$

A is not assumed to be unit triangular.

Unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

K On entry with UPLO = 'U' or 'u', K specifies the number of superdiagonals of the matrix A. On entry with UPLO = 'L' or 'l', K specifies the number of subdiagonals of the matrix A; K must satisfy 0 .le. K; unchanged on exit.

An array of dimension (LDA, N). On entry with UPLO = 'U' or 'u', the leading (K + 1) by N part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (K + 1) of the array, the first superdiagonal starting at position 2 in row K, and so on. The top left K by K triangle of the array A is not referenced.

The following program segment will transfer an upper triangular band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N

M = K + 1 - J

D0 10, I = MAX(1, J - K), J

A(M + I, J) = matrix(I, J)

10 CONTINUE

20 CONTINUE
```

On entry with UPLO = 'L' or 'l', the leading (K + 1) by N part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first subdiagonal starting at position 1 in row 2, and so on. The bottom right K by K triangle of the array A is not referenced.

The following program segment will transfer a lower triangular band matrix from conventional full matrix storage to band storage:

```
D0 20, J = 1, N

M = 1 - J

D0 10, I = J, MIN(N, J + K)

A(M + I, J) = matrix(I, J)

10 CONTINUE

20 CONTINUE
```

When *DIAG* = 'U' or 'u' the elements of the array *A* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity. Unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least (K + 1); unchanged on exit.

X A vector of dimension at least $(1 + (N-1))^*$ abs(INCX)); on entry, the incremented array X must contain the N element right-hand side vector b; on exit, X is overwritten with the solution vector x.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

STPSV, DTPSV, CTPSV, or ZTPSV Subroutine

Purpose

Solves systems of equations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE STPSV (UPLO, TRANS, DIAG, N, AP, X, INCX)

INTEGER INCX, N
CHARACTER*1 DIAG, TRANS, UPLO
REAL AP(*), X(*)

SUBROUTINE DTPSV (UPLO, TRANS, DIAG, N, AP, X, INCX)
INTEGER INCX,N
CHARACTER*1 DIAG, TRANS, UPLO
DOUBLE PRECISION AP(*), X(*)
```

```
SUBROUTINE CTPSV (UPLO, TRANS, DIAG,
N, AP, X, INCX)
INTEGER INCX,N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX AP(*), X(*)
SUBROUTINE ZTPSV (UPLO, TRANS, DIAG,
N, AP, X, INCX)
INTEGER INCX, N
CHARACTER*1 DIAG, TRANS, UPLO
COMPLEX*16 AP(*), X(*)
```

The STPSV, DTPSV, or ZTPSV subroutine solves one of the systems of equations:

A * x = b

OR

A' * x = b

where b and x are N element vectors and A is an N by N unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

Parameters

UPLO On entry, UPLO specifies whether the matrix is an upper or lower triangular matrix as follows:

UPLO = 'U' or 'u'

A is an upper triangular matrix.

UPLO = 'L' or 'l'

A is a lower triangular matrix.

Unchanged on exit.

TRANS On entry, TRANS specifies the equations to be solved as follows:

$$TRANS = 'N' \text{ or 'n'}$$

 $A * x = b$

$$A' * x = b$$

$$A' * x = b$$

Unchanged on exit.

DIAG On entry, *DIAG* specifies whether or not *A* is unit triangular as follows:

$$DIAG = 'U' \text{ or 'u'}$$

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit. AP A vector of dimension at least ((N * (N+1))/2); on entry with UPLO = 'U' or 'u', the array AP must contain the upper triangular matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on. Before entry with UPLO = 'L' or 'l', the array AP must contain the lower triangular matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. When DIAG = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity; unchanged on exit.

X A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the N element right-hand side vector b; on exit, X is overwritten with the solution vector x.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

SGER or DGER Subroutine

Purpose

Performs the rank 1 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE SGER (M, N, ALPHA, X, INCX, Y, INCY, A, LDA) **REAL** ALPHA INTEGER INCX, INCY, LDA, M, N **REAL** A(LDA,*), X(*), Y(*)SUBROUTINE DGER (M, N, ALPHA, X, INCX, Y, INCY, A, LDA) **DOUBLE PRECISION ALPHA INTEGER** *INCX*, *INCY*, *LDA*, *M*, *N* **DOUBLE PRECISION** A(LDA,*), X(*), Y(*)

Description

The **SGER** or **DGER** subroutine performs the rank 1 operation:

```
A := alpha * x * y' + A
```

where alpha is a scalar, x is an M element vector, y is an N element vector and A is an M by N matrix.

Parameters

Μ On entry, M specifies the number of rows of the matrix A; M must be at least 0; unchanged on exit. Ν On entry, N specifies the number of columns of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

Χ A vector of dimension at least $(1 + (M-1))^*$ abs(INCX); on entry, the incremented array X must contain the M element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCY))$; on entry, the incremented array Y must contain the N element vector v; unchanged on exit.

On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit. **INCY**

An array of dimension (LDA, N); on entry, the leading M by N part of the array A must contain the matrix Α of coefficients; on exit, A is overwritten by the updated matrix.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, M); unchanged on exit.

CGERU or ZGERU Subroutine

Purpose

Performs the rank 1 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE CGERU (M, N, ALPHA, X, INCX,
Y, INCY, A, LDA)
COMPLEX ALPHA
INTEGER INCX, INCY, LDA, M, N
COMPLEX A(LDA,*), X(*), Y(*)
SUBROUTINE ZGERU
COMPLEX*16 ALPHA
\textbf{INTEGER} \ \textit{INCX}, \textit{INCY}, \textit{LDA}, \textit{M}, \textit{N}
COMPLEX*16 A(LDA,*), X(*), Y(*)
```

Description

The **CGERU** or **ZGERU** subroutine performs the rank 1 operation:

```
A := alpha * x * y' + A
```

where alpha is a scalar, x is an M element vector, y is an N element vector and A is an M by N matrix.

Parameters

Μ	On entry, M specifies the number of rows of the matrix A; M must be at least 0; unchanged on exit.
Ν	On entry, N specifies the number of columns of the matrix A; N must be at least 0; unchanged on exit.
ALPHA	On entry, ALPHA specifies the scalar alpha; unchanged on exit.
X	A vector of dimension at least $(1 + (M-1) * abs(INCX))$; on entry, the incremented array X must contain the
	M element vector x; unchanged on exit.
INCX	On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.
Y	A vector of dimension at least $(1 + (N-1) * abs(INCY))$; on entry, the incremented array Y must contain the
	N element vector y; unchanged on exit.
INCY	On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.
Α	An array of dimension (LDA , N); on entry, the leading M by N part of the array A must contain the matrix of coefficients; on exit, A is overwritten by the updated matrix.
LDA	On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, M); unchanged on exit.

CGERC or ZGERC Subroutine

Purpose

Performs the rank 1 operation.

Library

```
SUBROUTINE CGERC (M, N, ALPHA, X, INCX,
Y, INCY, A, LDA)
COMPLEX ALPHA
INTEGER INCX, INCY, LDA, M, N
COMPLEX A(LDA,*), X(*), Y(*)
SUBROUTINE ZGERC
COMPLEX*16 ALPHA
INTEGER INCX, INCY, LDA, M, N
COMPLEX*16 A(LDA,*), X(*), Y(*)
```

Description

The **CGERC** or **ZGERC** subroutine performs the rank 1 operation:

```
A := alpha * x * conjg(y') + A
```

where alpha is a scalar, x is an M element vector, y is an N element vector and A is an M by N matrix.

Parameters

M	On entry, M specifies the number of rows of the matrix A; M must be at least 0; unchanged on exit.
Ν	On entry, N specifies the number of columns of the matrix A; N must be at least 0; unchanged on exit.
ALPHA	On entry, ALPHA specifies the scalar alpha; unchanged on exit.
X	A vector of dimension at least $(1 + (M-1) * abs(INCX))$; on entry, the incremented array X must contain the
	M element vector x; unchanged on exit.
INCX	On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.
Y	A vector of dimension at least $(1 + (N-1) * abs(INCY))$; on entry, the incremented array Y must contain the
	N element vector y; unchanged on exit.
INCY	On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.
Α	An array of dimension (LDA, N); on entry, the leading M by N part of the array A must contain the matrix
	of coefficients; on exit, A is overwritten by the updated matrix.
LDA	On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at
	least max(1, M); unchanged on exit.

CHER or ZHER Subroutine

Purpose

Performs the Hermitian rank 1 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE CHER (UPLO, N, ALPHA, X, INCX, A, LDA) **REAL** ALPHA INTEGER INCX, LDA, N CHARACTER*1 UPLO COMPLEX A(LDA,*), X(*)

SUBROUTINE ZHER (UPLO, N, ALPHA, X, INCX, A, LDA) **DOUBLE PRECISION** ALPHA **INTEGER** *INCX*, *LDA*, *N* CHARACTER*1 UPLO COMPLEX*16 A(LDA,*), X(*)

Description

The **CHER** or **ZHER** subroutine performs the Hermitian rank 1 operation:

```
A := alpha * x * conjg(x') + A
```

where alpha is a real scalar, x is an N element vector and A is an N by N Hermitian matrix.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of *A* is to be referenced.

UPLO = 'L' or 'l'

Only the lower triangular part of A is to be referenced.

Unchanged on exit.

N On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part Α of the array A must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements need not be set, they are assumed to be 0, and on exit they are set to 0.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, N); unchanged on exit.

CHPR or ZHPR Subroutine

Purpose

Performs the Hermitian rank 1 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE CHPR (UPLO, N, ALPHA, X, INCX, AP) **REAL** ALPHA

INTEGER *INCX*, *N* **CHARACTER*1** *UPLO* COMPLEX AP(*), X(*)SUBROUTINE ZHPR (UPLO, N, ALPHA, X, INCX, AP) **DOUBLE PRECISION ALPHA INTEGER** INCX,N CHARACTER*1 UPLO COMPLEX*16 AP(*), X(*)

Description

The **CHPR** or **ZHPR** subroutine performs the Hermitian rank 1 operation:

```
A := alpha * x * conjg(x') + A
```

where alpha is a real scalar, x is an N element vector and A is an N by N Hermitian matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array AP as follows:

UPLO = 'U' or 'u'

The upper triangular part of A is supplied in AP.

UPLO = 'L' or 'I'

The lower triangular part of A is supplied in AP.

Unchanged on exit.

On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the Χ

N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

APA vector of dimension at least ($(N^*(N+1))/2$); on entry with UPLO = U' or U' or U', the array U' must contain the upper triangular part of the Hermitian matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on. On exit, the array AP is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the array AP must contain the lower triangular part of the Hermitian matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. On exit, the array AP is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the

diagonal elements need not be set, they are assumed to be 0, and on exit they are set to 0.

CHER2 or ZHER2 Subroutine

Purpose

Performs the Hermitian rank 2 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE CHER2 (UPLO, N, ALPHA, X, INCX, Y, INCY, A, LDA)

```
COMPLEX ALPHA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
COMPLEX A(LDA,*), X(*), Y(*)
SUBROUTINE ZHER2 (UPLO, N, ALPHA,
X, INCX, Y, INCY, A, LDA)
COMPLEX*16 ALPHA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
COMPLEX*16 A(LDA,*), X(*), Y(*)
```

Description

The CHER2 or ZHER2 subroutine performs the Hermitian rank 2 operation:

```
A := alpha * x * conjg(y') + conjg(alpha) * y * conjy(x') + A
```

where alpha is a scalar, x and y are N element vectors and A is an N by N Hermitian matrix.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of A is to be referenced.

UPLO = 'L' or 'I'

Only the lower triangular part of A is to be referenced.

Unchanged on exit.

On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

Χ A vector of dimension at least (1 + (N-1)) * abs(INCX)); on entry, the incremented vector X must contain

the N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

A vector of dimension at least (1 + (N-1) * abs(INCY)); on entry, the incremented vector Y must contain

the N element vector y; unchanged on exit.

On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit. **INCY**

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements need not be set;

they are assumed to be 0, and on exit they are set to 0.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at

least max(1, N); unchanged on exit.

CHPR2 or ZHPR2 Subroutine

Purpose

Performs the Hermitian rank 2 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE CHPR2 (UPLO, N, ALPHA,
X, INCX, Y, INCY, AP)
COMPLEX ALPHA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
COMPLEX AP(*), X(*), Y(*)
SUBROUTINE
ZHPR2
COMPLEX*16 ALPHA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
COMPLEX*16 AP(*), X(*), Y(*)
```

Description

The CHPR2 or ZHPR2 subroutine performs the Hermitian rank 2 operation:

```
A := alpha * x * conjq(y') + conjq(alpha) * y * conjq(x') + A
```

where alpha is a scalar, x and y are N element vectors and A is an N by N Hermitian matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array AP as follows:

UPLO = 'U' or 'u'

The upper triangular part of A is supplied in AP.

UPLO = 'L' or 'I'

The lower triangular part of A is supplied in AP.

Unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

Χ A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the

N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

A vector of dimension at least (1 + (N-1) * abs(INCY)); on entry, the incremented array Y must contain

the N element vector y; unchanged on exit.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit. AP

A vector of dimension at least ((N * (N+1))/2); on entry with UPLO = 'U' or 'u', the array AP must contain the upper triangular part of the Hermitian matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on. On exit, the array AP is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the array AP must contain the lower triangular part of the Hermitian matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. On exit, the array AP is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements need not be set, they are assumed to be 0, and on exit they are set to 0.

SSYR or DSYR Subroutine

Purpose

Performs the symmetric rank 1 operation.

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE SSYR (UPLO, N, ALPHA, X, INCX, A, LDA) **REAL** ALPHA INTEGER INCX, LDA, N CHARACTER*1 UPLO **REAL** A(LDA,*), X(*)SUBROUTINE DSYR (UPLO, N, ALPHA, X, INCX, A, LDA) **DOUBLE PRECISION ALPHA INTEGER** *INCX*, *LDA*, *N* CHARACTER*1 UPLO **DOUBLE PRECISION** A(LDA,*), X(*)

Description

The **SSYR** or **DSYR** subroutine performs the symmetric rank 1 operation:

```
A := alpha * x * x' + A
```

where alpha is a real scalar, x is an N element vector and A is an N by N symmetric matrix.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of A is to be referenced.

UPLO = 'L' or 'I'

Only the lower triangular part of A is to be referenced.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the X N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, N); unchanged on exit.

SSPR or DSPR Subroutine

Purpose

Performs the symmetric rank 1 operation.

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE SSPR(UPLO, N, ALPHA, X, INCX, AP) **REAL** ALPHA **INTEGER** INCX, N CHARACTER*1 UPLO **REAL** AP(*), X(*)SUBROUTINE DSPR(UPLO, N, ALPHA, X, INCX, AP) **DOUBLE PRECISION** ALPHA INTEGER INCX.N CHARACTER*1 UPLO DOUBLE PRECISION AP(*), X(*)

Description

The **SSPR** or **DSPR** subroutine performs the symmetric rank 1 operation:

```
A := alpha * x * x' + A
```

where alpha is a real scalar, x is an N element vector and A is an N by N symmetric matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array AP as follows:

UPLO = 'U' or 'u'

The upper triangular part of A is supplied in AP.

UPLO = 'L' or 'I'

The lower triangular part of A is supplied in AP.

Unchanged on exit.

On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the Χ

N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

A vector of dimension at least ((N * (N+1))/2); on entry with UPLO = 'U' or 'u', the array AP must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on. On exit, the array AP is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the array AP must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. On exit, the array AP is overwritten by the lower triangular part of the updated matrix.

SSYR2 or DSYR2 Subroutine

Purpose

Performs the symmetric rank 2 operation.

AP

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSYR2 (UPLO, N, ALPHA, X,
INCX, Y, INCY, A, LDA)
REAL ALPHA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
REAL A(LDA,*), X(*), Y(*)
SUBROUTINE DSYR2 (UPLO, N, ALPHA, X,
INCX, Y, INCY, A, LDA)
DOUBLE PRECISION ALPHA
INTEGER INCX, INCY, LDA, N
CHARACTER*1 UPLO
DOUBLE PRECISION A(LDA,*), X(*), Y(*)
```

Description

The SSYR2 or DSYR2 subroutine performs the symmetric rank 2 operation:

```
A := alpha * x * y' + alpha * y * x' + A
```

where alpha is a scalar, x and y are N element vectors and A is an N by N symmetric matrix.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of A is to be referenced.

UPLO = 'L' or 'I'

Only the lower triangular part of A is to be referenced.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the X N element vector x; unchanged on exit.

On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit. INCX

A vector of dimension at least $(1 + (N-1)^* abs(INCY))$; on entry, the incremented array Y must contain the N element vector y; unchanged on exit.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit.

An array of dimension (LDA, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program; LDA must be at least max(1, N); unchanged on exit.

SSPR2 or DSPR2 Subroutine

Purpose

Performs the symmetric rank 2 operation.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSPR2 (UPLO, N, ALPHA, X,
INCX, Y, INCY, AP)
REAL ALPHA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
REAL AP(*), X(*), Y(*)
SUBROUTINE DSPR2 (UPLO, N, ALPHA, X,
INCX, Y, INCY, AP)
DOUBLE PRECISION ALPHA
INTEGER INCX, INCY, N
CHARACTER*1 UPLO
DOUBLE PRECISION AP(*), X(*), Y(*)
```

Description

The SSPR2 or DSPR2 subroutine performs the symmetric rank 2 operation:

```
A := alpha * x * y' + alpha * y * x' + A
```

where alpha is a scalar, x and y are N element vectors and A is an N by N symmetric matrix, supplied in packed form.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array AP as follows:

```
UPLO = 'U' \text{ or 'u'}
```

The upper triangular part of A is supplied in AP.

UPLO = 'L' or 'I'

The lower triangular part of A is supplied in AP.

Unchanged on exit.

Ν On entry, N specifies the order of the matrix A; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCX))$; on entry, the incremented array X must contain the

N element vector x; unchanged on exit.

INCX On entry, INCX specifies the increment for the elements of X; INCX must not be 0; unchanged on exit.

A vector of dimension at least $(1 + (N-1)^* abs(INCY))$; on entry, the incremented array Y must contain the

N element vector y; unchanged on exit.

INCY On entry, INCY specifies the increment for the elements of Y; INCY must not be 0; unchanged on exit. AP

A vector of dimension at least ((N * (N+1))/2); on entry with UPLO = 'U' or 'u', the array AP must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(1,2) and A(2,2) respectively, and so on. On exit, the array AP is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the array AP must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that AP(1) contains A(1,1), AP(2) and AP(3) contain A(2,1) and A(3,1) respectively, and so on. On exit, the array AP is overwritten by the lower triangular part of the updated matrix.

SGEMM, DGEMM, CGEMM, or ZGEMM Subroutine

Purpose

Performs matrix-matrix operations on general matrices.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SGEMM(TRANSA, TRANSB, M, N, K,
ALPHA, A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 TRANSA, TRANSB
INTEGER M, N, K, LDA, LDB, LDC
REAL ALPHA, BETA
REAL A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE DGEMM(TRANSA, TRANSB, M, N, K,
ALPHA, A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 TRANSA, TRANSB
INTEGER M,N,K,LDA,LDB,LDC
DOUBLE PRECISION ALPHA, BETA
DOUBLE PRECISION A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE CGEMM(TRANSA, TRANSB, M, N, K,
ALPHA, A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 TRANSA, TRANSB
INTEGER M,N,K,LDA,LDB,LDC
COMPLEX ALPHA, BETA
COMPLEX A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE ZGEMM (TRANSA, TRANSB, M, N, K,
ALPHA, A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 TRANSA, TRANSB
INTEGER M,N,K,LDA,LDB,LDC
COMPLEX*16 ALPHA, BETA
COMPLEX*16 A(LDA,*), B(LDB,*), C(LDC,*)
```

Description

The **SGEMM**, **DGEMM**, or **ZGEMM** subroutine performs one of the matrix-matrix operations:

```
C := alpha * op(A) * op(B) + beta * C
```

where op(X) is one of op(X) = X or op(X) = X', alpha and beta are scalars, and A, B and C are matrices, with op(A) an M by K matrix, op(B) a K by N matrix and C an M by N matrix.

Parameters

TRANSA On entry, TRANSA specifies the form of op(A) to be used in the matrix multiplication as follows:

> TRANSA = 'N' or 'n'op(A) = ATRANSA = 'T' or 't'op(A) = A'TRANSA = 'C' or 'c'op(A) = A'

Unchanged on exit.

TRANSB On entry, TRANSB specifies the form of op(B) to be used in the matrix multiplication as follows:

> TRANSB = 'N' or 'n' op(B) = BTRANSB = 'T' or 't'op(B) = B'TRANSB = 'C' or 'c'op(B) = B'

Unchanged on exit.

On entry, M specifies the number of rows of the matrix op(A) and of the matrix C; M must be at least 0; M unchanged on exit.

Ν On entry, N specifies the number of columns of the matrix op(B) and the number of columns of the matrix C; N must be at least 0; unchanged on exit.

K On entry, K specifies the number of columns of the matrix op(A) and the number of rows of the matrix op(B); K must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, KA), where KA is K when TRANSA = 'N' or 'n', and is M otherwise; on entry with TRANSA = 'N' or 'n', the leading M by K part of the array A must contain the matrix A, otherwise the leading K by M part of the array A must contain the matrix A; unchanged on exit.

On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When TRANSA LDA = 'N' or 'n' then LDA must be at least max(1, M), otherwise LDA must be at least max(1, K); unchanged on exit.

B An array of dimension (LDB, KB) where KB is N when TRANSB = 'N' or 'n', and is K otherwise; on entry with TRANSB = 'N' or 'n', the leading K by N part of the array B must contain the matrix B, otherwise the leading N by K part of the array B must contain the matrix B; unchanged on exit.

LDB On entry, LDB specifies the first dimension of B as declared in the calling (sub) program. When TRANSB = 'N' or 'n' then LDB must be at least max(1, K), otherwise LDB must be at least max(1, N); unchanged on exit.

BETA On entry, BETA specifies the scalar beta. When BETA is supplied as 0 then C need not be set on input; unchanged on exit.

An array of dimension (LDC, N); on entry, the leading M by N part of the array C must contain the matrix C, except when beta is 0, in which case C need not be set on entry; on exit, the array C is overwritten by the M by N matrix (alpha * op(A) * op(B) + beta * C).

LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at least max(1, M); unchanged on exit.

SSYMM, DSYMM, CSYMM, or ZSYMM Subroutine

Purpose

Performs matrix-matrix matrix operations on symmetric matrices.

C

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSYMM(SIDE, UPLO, M, N, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 SIDE, UPLO
INTEGER M, N, LDA, LDB, LDC
REAL ALPHA, BETA
REAL A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE DSYMM(SIDE, UPLO, M, N, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 SIDE, UPLO
INTEGER M,N,LDA,LDB,LDC
DOUBLE PRECISION ALPHA, BETA
DOUBLE PRECISION A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE CSYMM(SIDE, UPLO, M, N, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 SIDE, UPLO
INTEGER M,N,LDA,LDB,LDC
COMPLEX ALPHA, BETA
COMPLEX A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE ZSYMM(SIDE, UPLO, M, N, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 SIDE, UPLO
INTEGER M,N,LDA,LDB,LDC
COMPLEX*16 ALPHA, BETA
COMPLEX*16 A(LDA,*), B(LDB,*), C(LDC,*)
```

Description

The SSYMM, DSYMM, CSYMM, or ZSYMM subroutine performs one of the matrix-matrix operations:

```
C := alpha * A * B + beta * C
OR
C := alpha * B * A + beta * C
```

where alpha and beta are scalars, A is a symmetric matrix and B and C are M by N matrices.

Parameters

SIDE

On entry, SIDE specifies whether the symmetric matrix A appears on the left or right in the operation as

```
SIDE = 'L' or 'I'
         C := alpha * A * B + beta * C
SIDE = 'R' \text{ or 'r'}
         C := alpha * B * A + beta * C
```

Unchanged on exit.

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the symmetric matrix A is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of the symmetric matrix is to be referenced.

UPLO = 'L' or 'l'

Only the lower triangular part of the symmetric matrix is to be referenced.

Unchanged on exit.

Ν

On entry, M specifies the number of rows of the matrix C; M must be at least 0; unchanged on exit. Μ

On entry, N specifies the number of columns of the matrix C; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, KA), where KA is M when SIDE = 'L' or 'l' and is N otherwise; on entry with Α SIDE = 'L' or 'l', the M by M part of the array A must contain the symmetric matrix, such that when UPLO ='U' or 'u', the leading M by M upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when UPLO = 'L' or 'I', the leading M by M lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On entry with SIDE = 'R' or 'r', the N by N part of the array A must contain the symmetric matrix, such that when UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced; unchanged on exit.

On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When SIDE = 'L' LDA or 'I' then LDA must be at least max(1, M), otherwise LDA must be at least max(1, N); unchanged on

B An array of dimension (LDB, N); on entry, the leading M by N part of the array B must contain the matrix B; unchanged on exit.

LDB On entry, LDB specifies the first dimension of B as declared in the calling (sub) program; LDB must be at least max(1, M); unchanged on exit.

On entry, BETA specifies the scalar beta; when BETA is supplied as 0 then C need not be set on input; **BETA** unchanged on exit.

CAn array of dimension (LDC, N); on entry, the leading M by N part of the array C must contain the matrix C, except when beta is 0, in which case C need not be set on entry; on exit, the array C is overwritten by the M by N updated matrix.

LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at least max(1, M); unchanged on exit.

CHEMM or ZHEMM Subroutine

Purpose

Performs matrix-matrix operations on Hermitian matrices.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE CHEMM(SIDE, UPLO, M, N, ALPHA, A, LDA, B, LDB, BETA, C, LDC) CHARACTER*1 SIDE, UPLO INTEGER M, N, LDA, LDB, LDC COMPLEX ALPHA, BETA COMPLEX A(LDA,*), B(LDB,*), C(LDC,*)

```
SUBROUTINE ZHEMM(SIDE, UPLO, M, N, ALPHA, A,
LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 SIDE, UPLO
INTEGER M,N,LDA,LDB,LDC
COMPLEX*16 ALPHA, BETA
COMPLEX*16 A(LDA,*), B(LDB,*), C(LDC,*)
```

Purpose

The **CHEMM** or **ZHEMM** subroutine performs one of the matrix-matrix operations:

```
C := alpha * A * B + beta * C
OR
```

C := alpha * B * A + beta * C

where alpha and beta are scalars, A is an Hermitian matrix, and B and C are M by N matrices.

Parameters

SIDE

On entry, SIDE specifies whether the Hermitian matrix A appears on the left or right in the operation as follows:

```
SIDE = 'L' or 'I'
         C := alpha * A * B + beta * C
SIDE = 'R' \text{ or 'r'}
         C := alpha * B * A + beta * C
```

Unchanged on exit.

UPLO

On entry, UPLO specifies whether the upper or lower triangular part of the Hermitian matrix A is to be referenced as follows:

```
UPLO = 'U' \text{ or 'u'}
```

Only the upper triangular part of the Hermitian matrix is to be referenced.

UPLO = 'L' or 'l'

Only the lower triangular part of the Hermitian matrix is to be referenced.

Unchanged on exit.

Μ On entry, M specifies the number of rows of the matrix C; M must be at least 0; unchanged on exit.

On entry, N specifies the number of columns of the matrix C; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, KA), where KA is M when SIDE = 'L' or 'l' and is N otherwise; on entry

with SIDE = 'L' or 'l', the M by M part of the array A must contain the Hermitian matrix, such that when UPLO = 'U' or 'u', the leading M by M upper triangular part of the array A must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of A is not referenced, and when UPLO = 'L' or 'l', the leading M by M lower triangular part of the array A must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of A is not referenced; on entry with SIDE = 'R' or 'r', the N by N part of the array A must contain the Hermitian matrix, such that when UPLO = 'U' or 'u', the leading N by N upper triangular part of the array A must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of A is not referenced, and when UPLO = 'L' or 'l', the leading N by N lower triangular part of the array A must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of A is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be 0; unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When SIDE = 'L' or 'l' then LDA must be at least max(1, M), otherwise LDA must be at least max(1, N); unchanged on exit.

В An array of dimension (LDB, N); on entry, the leading M by N part of the array B must contain the matrix B; unchanged on exit.

On entry, LDB specifies the first dimension of B as declared in the calling (sub) program; LDB must be at LDB least max(1, M); unchanged on exit.

BETA On entry, BETA specifies the scalar beta. When BETA is supplied as 0 then C need not be set on input;

unchanged on exit.

An array of dimension (LDC, N); on entry, the leading M by N part of the array C must contain the matrix C, except when beta is 0, in which case C need not be set on entry; on exit, the array C is overwritten by the M by N updated matrix.

LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at

least max(1, M); unchanged on exit.

SSYRK, DSYRK, CSYRK, or ZSYRK Subroutine

Purpose

Perform symmetric rank k operations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSYRK(UPLO, TRANS, N, K, ALPHA,
A, LDA, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N, K, LDA, LDC
REAL ALPHA, BETA
REAL A(LDA,*), C(LDC,*)
SUBROUTINE DSYRK(UPLO, TRANS, N, K, ALPHA,
A, LDA, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N,K,LDA,LDC
DOUBLE PRECISION ALPHA, BETA
DOUBLE PRECISION A(LDA,*), C(LDC,*)
SUBROUTINE CSYRK(UPLO, TRANS, N, K, ALPHA,
A, LDA, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N,K,LDA,LDC
COMPLEX ALPHA, BETA
COMPLEX A(LDA,*), C(LDC,*)
SUBROUTINE ZSYRK(UPLO, TRANS, N, K, ALPHA,
A, LDA, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N,K,LDA,LDC
COMPLEX*16 ALPHA, BETA
COMPLEX*16 A(LDA,*), C(LDC,*)
```

Description

The SSYRK, DSYRK, CSYRK or ZSYRK subroutine performs one of the symmetric rank k operations:

```
C := alpha * A * A' + beta * C
OR
C := alpha * A' * A + beta * C
```

where alpha and beta are scalars, C is an N by N symmetric matrix, and A is an N by K matrix in the first case and a K by N matrix in the second case.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array C is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of C is to be referenced.

UPLO = 'L' or 'I'

Only the lower triangular part of *C* is to be referenced.

Unchanged on exit.

TRANS On entry, TRANS specifies the operation to be performed as follows:

Unchanged on exit.

Ν On entry, N specifies the order of the matrix C; N must be at least 0; unchanged on exit.

On entry with TRANS = 'N' or 'n', K specifies the number of columns of the matrix A, and on entry with K TRANS = 'T' or 't' or 'C' or 'C', K specifies the number of rows of the matrix A; K must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, KA), where KA is K when TRANS = 'N' or 'n', and is N otherwise; on entry with TRANS = N' or 'n', the leading N by K part of the array A must contain the matrix A, otherwise the leading K by N part of the array A must contain the matrix A; unchanged on exit.

On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When TRANS = LDA 'N' or 'n', LDA must be at least max(1, N); otherwise LDA must be at least max(1, K); unchanged on

BETA On entry, BETA specifies the scalar beta; unchanged on exit.

CAn array of dimension (LDC, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced; on exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix; on entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced; on exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.

LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at least max(1, N); unchanged on exit.

CHERK or ZHERK Subroutine

Purpose

Performs Hermitian rank k operations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE CHERK (UPLO, TRANS, N, K, ALPHA, A, LDA, BETA, C, LDC) CHARACTER*1 UPLO, TRANS

```
INTEGER N, K, LDA, LDC
REAL ALPHA, BETA
COMPLEX A(LDA,*), C(LDC,*)
SUBROUTINE ZHERK (UPLO, TRANS, N, K, ALPHA,
A, LDA, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N,K,LDA,LDC
DOUBLE PRECISION ALPHA, BETA
COMPLEX*16 A(LDA,*), C(LDC,*)
```

Description

The **CHERK** or **ZHERK** subroutine performs one of the Hermitian rank k operations:

```
C := alpha * A * conjg( A' ) + beta * C
OR
C := alpha * conjg( A' ) * A + beta * C
```

where alpha and beta are real scalars, C is an N by N Hermitian matrix, and A is an N by K matrix in the first case and a K by N matrix in the second case.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array C is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of C is to be referenced.

UPLO = 'L' or 'l'

Only the lower triangular part of *C* is to be referenced.

Unchanged on exit.

TRANS On entry, TRANS specifies the operation to be performed as follows:

```
TRANS = 'N' \text{ or 'n'}
         C := alpha * A * conjg(A') + beta * C
TRANS = 'C' \text{ or 'c'}
         C := alpha * conig(A') * A + beta * C
```

Unchanged on exit.

Ν On entry, N specifies the order of the matrix C; N must be at least 0; unchanged on exit.

On entry with TRANS = 'N' or 'n', K specifies the number of columns of the matrix A, and on entry with K TRANS = 'C' or 'c', K specifies the number of rows of the matrix A; K must be at least 0; unchanged on

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, KA), where KA is K when TRANS = 'N' or 'n', and is N otherwise; on entry with TRANS = 'N' or 'n', the leading N by K part of the array A must contain the matrix A, otherwise the leading K by N part of the array A must contain the matrix A; unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When TRANS = 'N' or 'n', LDA must be at least max(1, N), otherwise LDA must be at least max(1, K); unchanged on exit.

BETA On entry, BETA specifies the scalar beta; unchanged on exit.

- CAn array of dimension (LDC, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array C must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of C is not referenced; on exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix; on entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array C must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of C is not referenced; on exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements need not be set, they are assumed to be 0, and on exit they are set to 0.
- LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at least max(1, N); unchanged on exit.

SSYR2K, DSYR2K, CSYR2K, or ZSYR2K Subroutine

Purpose

Performs symmetric rank 2k operations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE SSYR2K(UPLO, TRANS, N, K, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N, K, LDA, LDB, LDC
REAL ALPHA, BETA
REAL A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE DSYR2K(UPLO, TRANS, N, K, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N,K,LDA,LDB,LDC
DOUBLE PRECISION ALPHA, BETA
DOUBLE PRECISION A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE CSYR2K(UPLO, TRANS, N, K, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)

INTEGER N,K,LDA,LDB,LDC
COMPLEX ALPHA, BETA
COMPLEX A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE ZSYR2K(UPLO, TRANS, N, K, ALPHA,
A, LDA, B, LDB, BETA, C, LDC)
CHARACTER*1 UPLO,TRANS
INTEGER N,K,LDA,LDB,LDC
COMPLEX*16 ALPHA, BETA
COMPLEX*16 A(LDA,*), B(LDB,*), C(LDC,*)
```

Description

The SSYR2K, DSYR2K, CSYR2K, or ZSYR2K subroutine performs one of the symmetric rank 2k operations:

```
C := alpha * A * B' + alpha * B * A' + beta * C
OR
C := alpha * A' * B + alpha * B' * A + beta * C
```

where alpha and beta are scalars, C is an N by N symmetric matrix, and A and B are N by K matrices in the first case and K by N matrices in the second case.

Parameters

UPLO On entry, UPLO specifies whether the upper or lower triangular part of the array C is to be referenced as follows:

UPLO = 'U' or 'u'

Only the upper triangular part of *C* is to be referenced.

UPLO = 'L' or 'l'

Only the lower triangular part of *C* is to be referenced.

Unchanged on exit.

TRANS On entry, *TRANS* specifies the operation to be performed as follows:

Unchanged on exit.

Ν On entry, N specifies the order of the matrix C; N must be at least 0; unchanged on exit.

K On entry with TRANS = 'N' or 'n', K specifies the number of columns of the matrices A and B, and on entry with TRANS = 'T' or 't', K specifies the number of rows of the matrices A and B; K must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

An array of dimension (LDA, KA), where KA is K when TRANS = 'N' or 'n', and is N otherwise; on entry with TRANS = 'N' or 'n', the leading N by K part of the array A must contain the matrix A, otherwise the leading K by N part of the array A must contain the matrix A; unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When TRANS = 'N' or 'n', LDA must be at least max(1, N); otherwise LDA must be at least max(1, K); unchanged on exit.

В An array of dimension (LDB, KB), where KB is K when TRANS = 'N' or 'n', and is N otherwise; on entry with TRANS = N' or 'n', the leading N by K part of the array B must contain the matrix B, otherwise the leading K by N part of the array B must contain the matrix B; unchanged on exit.

LDB On entry, LDB specifies the first dimension of B as declared in the calling (sub) program. When TRANS ='N' or 'n', LDB must be at least max(1, N); otherwise LDB must be at least max(1, K); unchanged on

BETA On entry, BETA specifies the scalar beta; unchanged on exit.

CAn array of dimension (LDC, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced; on exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. On entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced; on exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.

LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at least max(1, N); unchanged on exit.

CHER2K or ZHER2K Subroutine

Purpose

Performs Hermitian rank 2k operations.

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE CHER2K(UPLO, TRANS, N, K, ALPHA,
A, LDA, B, LDB, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N, K, LDA, LDB, LDC
REAL BETA
COMPLEX ALPHA
COMPLEX A(LDA,*), B(LDB,*), C(LDC,*)
SUBROUTINE ZHER2K(UPLO, TRANS, N, K, ALPHA,
A, LDA, B, LDB, C, LDC)
CHARACTER*1 UPLO, TRANS
INTEGER N,K,LDA,LDB,LDC
DOUBLE PRECISION BETA
COMPLEX*16 ALPHA
COMPLEX*16 A(LDA,*), B(LDB,*), C(LDC,*)
```

Description

The CHER2K or ZHER2K subroutine performs one of the Hermitian rank 2k operations:

```
C := alpha * A * conjg(B') + conjg(alpha) * B * conjg(A') + beta * C
OR
C := alpha * conjg(A') * B + conjg(alpha) * conjg(B') * A + beta * C
```

where alpha and beta are scalars with beta real, C is an N by N Hermitian matrix, and A and B are N by K matrices in the first case and K by N matrices in the second case.

Parameters

```
UPLO
           On entry, UPLO specifies whether the upper or lower triangular part of the array C is to be referenced as
           follows:
            UPLO = 'U' \text{ or 'u'}
                     Only the upper triangular part of C is to be referenced.
            UPLO = 'L' \text{ or 'I'}
                     Only the lower triangular part of C is to be referenced.
           Unchanged on exit.
TRANS
           On entry, TRANS specifies the operation to be performed as follows:
            TRANS = 'N' \text{ or 'n'}
                     C := alpha * A * conjg( B' ) + conjg( alpha ) * B * conjg( A' ) + beta * C
```

```
TRANS = 'C' or 'c'
        C := alpha * conjg(A') * B + conjg(alpha) * conjg(B') * A + beta * C
```

Unchanged on exit.

Ν On entry, N specifies the order of the matrix C; N must be at least 0; unchanged on exit.

K On entry with TRANS = 'N' or 'n', K specifies the number of columns of the matrices A and B, and on entry with TRANS = 'C' or 'c', K specifies the number of rows of the matrices A and B; K must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha; unchanged on exit.

- Α An array of dimension (LDA, KA), where KA is K when TRANS = 'N' or 'n', and is N otherwise; on entry with TRANS = 'N' or 'n', the leading N by K part of the array A must contain the matrix A, otherwise the leading K by N part of the array A must contain the matrix A; unchanged on exit.
- LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When TRANS = 'N' or 'n', LDA must be at least max(1, N); otherwise LDA must be at least max(1, K); unchanged on
- В An array of dimension (LDB, KB), where KB is K when TRANS = 'N' or 'n', and is N otherwise; on entry with TRANS = N' or 'n', the leading N by K part of the array B must contain the matrix B, otherwise the leading K by N part of the array B must contain the matrix B; unchanged on exit.
- LDB On entry, LDB specifies the first dimension of B as declared in the calling (sub) program. When TRANS = 'N' or 'n', LDB must be at least max(1, N); otherwise LDB must be at least max(1, K); unchanged on
- **BETA** On entry, BETA specifies the scalar beta; unchanged on exit.
- An array of dimension (LDC, N); on entry with UPLO = 'U' or 'u', the leading N by N upper triangular part of the array C must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of C is not reference; on exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix; on entry with UPLO = 'L' or 'l', the leading N by N lower triangular part of the array C must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of C is not referenced; on exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements need not be set, they are assumed to be 0, and on exit they are set to 0.
- LDC On entry, LDC specifies the first dimension of C as declared in the calling (sub) program; LDC must be at least max(1, N); unchanged on exit.

STRMM, DTRMM, CTRMM, or ZTRMM Subroutine

Purpose

Performs matrix-matrix operations on triangular matrices.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

SUBROUTINE STRMM(SIDE, UPLO, TRANSA, DIAG, M, N, ALPHA, A, LDA, B, LDB) CHARACTER*1 SIDE, UPLO, TRANSA, DIAG INTEGER M, N, LDA, LDB REAL ALPHA **REAL** A(LDA,*), B(LDB,*)SUBROUTINE DTRMM(SIDE, UPLO, TRANSA, DIAG, M, N, ALPHA, A, LDA, B, LDB) CHARACTER*1 SIDE, UPLO, TRANSA, DIAG **INTEGER** M,N,LDA,LDB **DOUBLE PRECISION ALPHA DOUBLE PRECISION** A(LDA,*), B(LDB,*) SUBROUTINE CTRMM(SIDE, UPLO, TRANSA, DIAG, M, N, ALPHA, A, LDA, B, LDB) CHARACTER*1 SIDE, UPLO, TRANSA, DIAG **INTEGER** M,N,LDA,LDB **COMPLEX** ALPHA COMPLEX A(LDA,*), B(LDB,*) SUBROUTINE ZTRMM(SIDE, UPLO, TRANSA, DIAG, M, N, ALPHA, A, LDA, B, LDB) CHARACTER*1

```
SIDE, UPLO, TRANSA, DIAG
INTEGER M,N,LDA,LDB
COMPLEX*16 ALPHA
COMPLEX*16 A(LDA,*), B(LDB,*)
```

Description

The **STRMM**, **DTRMM**, **cTRMM**, or **ZTRMM** subroutine performs one of the matrix-matrix operations:

```
B := alpha * op(A) * B
OR
B := alpha * B * op(A)
```

where alpha is a scalar, B is an M by N matrix, A is a unit, or non-unit, upper or lower triangular matrix, and op(A) is either op(A) = A or op(A) = A'.

Parameters

SIDE On entry, SIDE specifies whether op(A) multiplies B from the left or right as follows:

> SIDE = 'L' or 'I' B := alpha * op(A) * BSIDE = 'R' or 'r'B := alpha * B * op(A)

Unchanged on exit.

UPLO On entry, *UPLO* specifies whether the matrix *A* is an upper or lower triangular matrix as follows:

> UPLO = 'U' or 'u'A is an upper triangular matrix.

UPLO = 'L' or 'I'

A is a lower triangular matrix.

Unchanged on exit.

TRANSA On entry, TRANSA specifies the form of op(A) to be used in the matrix multiplication as follows:

> TRANSA = 'N' or 'n'op(A) = ATRANSA = 'T' or 't' op(A) = A'TRANSA = 'C' or 'c' op(A) = A'

Unchanged on exit.

DIAG On entry, DIAG specifies whether or not A is unit triangular as follows:

DIAG = 'U' or 'u'

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

On entry, M specifies the number of rows of B; M must be at least 0; unchanged on exit. Μ Ν On entry, N specifies the number of columns of B; N must be at least 0; unchanged on exit.

ALPHA On entry, ALPHA specifies the scalar alpha. When alpha is 0 then A is not referenced and B need not be

set before entry; unchanged on exit.

- A An array of dimension (LDA, k), where k is M when SIDE = 'L' or 'l' and is N when SIDE = 'R' or 'r'; on entry with UPLO = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced; on entry with UPLO = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. When DIAG = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity; unchanged on exit.
- Do entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When SIDE = 'L' or 'l' then LDA must be at least max(1, M), when SIDE = 'R' or 'r' then LDA must be at least max(1, M); unchanged on exit.
- B An array of dimension (*LDB*, *N*); on entry, the leading *M* by *N* part of the array *B* must contain the matrix *B*, and on exit is overwritten by the transformed matrix.
- LDB On entry, LDB specifies the first dimension of B as declared in the calling (sub) program; LDB must be at least max(1, M); unchanged on exit.

STRSM, DTRSM, CTRSM, or ZTRSM Subroutine

Purpose

Solves certain matrix equations.

Library

BLAS Library (libblas.a)

FORTRAN Syntax

```
SUBROUTINE STRSM(SIDE, UPLO, TRANSA, DIAG,
M, N, ALPHA, A, LDA, B, LDB)
CHARACTER*1 SIDE, UPLO, TRANSA, DIAG
INTEGER M, N, LDA, LDB
REAL ALPHA
REAL A(LDA,*), B(LDB,*)
SUBROUTINE DTRSM(SIDE, UPLO, TRANSA, DIAG,
M, N, ALPHA, A, LDA, B, LDB)
CHARACTER*1 SIDE, UPLO, TRANSA, DIAG
INTEGER M,N,LDA,LDB
DOUBLE PRECISION ALPHA
DOUBLE PRECISION A(LDA,*), B(LDB,*)
SUBROUTINE CTRSM(SIDE, UPLO, TRANSA, DIAG,
M, N, ALPHA, A, LDA, B, LDB)
CHARACTER*1 SIDE, UPLO, TRANSA, DIAG
INTEGER M,N,LDA,LDB
COMPLEX ALPHA
COMPLEX A(LDA,*), B(LDB,*)
SUBROUTINE ZTRSM(SIDE, UPLO, TRANSA, DIAG,
M, N, ALPHA, A, LDA, B, LDB)
CHARACTER*1 SIDE, UPLO, TRANSA, DIAG
INTEGER M,N,LDA,LDB
COMPLEX*16 ALPHA
COMPLEX*16 A(LDA,*), B(LDB,*)
```

Description

The STRSM, DTRSM, CTRSM, or ZTRSM subroutine solves one of the matrix equations:

op(A) * X = alpha * B
 X * op(A) = alpha * B

where alpha is a scalar, X and B are M by N matrices, A is a unit, or non-unit, upper or lower triangular matrix, and op(A) is either op(A) = A or op(A) = A'. The matrix X is overwritten on B.

Parameters

SIDE On entry, SIDE specifies whether op(A) appears on the left or right of X as follows:

Unchanged on exit.

UPLO. On entry, *UPLO* specifies whether the matrix A is an upper or lower triangular matrix as follows:

UPLO = 'U' or 'u'

A is an upper triangular matrix.

UPLO = 'L' or 'I'

A is a lower triangular matrix.

Unchanged on exit.

TRANSA On entry, TRANSA specifies the form of op(A) to be used in the matrix multiplication as follows:

$$TRANSA = 'N' \text{ or 'n'}$$
 $op(A) = A$
 $TRANSA = 'T' \text{ or 't'}$
 $op(A) = A'$
 $TRANSA = 'C' \text{ or 'c'}$
 $op(A) = A'$

Unchanged on exit.

DIAG On entry, *DIAG* specifies whether or not *A* is unit triangular as follows:

DIAG = 'U' or 'u'

A is assumed to be unit triangular.

DIAG = 'N' or 'n'

A is not assumed to be unit triangular.

Unchanged on exit.

ALPHA

Μ On entry, M specifies the number of rows of B; M must be at least 0; unchanged on exit.

Ν On entry, N specifies the number of columns of B; N must be at least 0; unchanged on exit.

On entry, ALPHA specifies the scalar alpha. When alpha is 0 then A is not referenced and B need not be set before entry; unchanged on exit.

An array of dimension (LDA, k), where k is M when SIDE = 'L' or 'l' and is N when SIDE = 'R' or 'r'. On Α entry with UPLO = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced; on entry with UPLO = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. When DIAG = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity; unchanged on exit.

LDA On entry, LDA specifies the first dimension of A as declared in the calling (sub) program. When SIDE = 'L' or 'i', LDA must be at least max(1, M); when SIDE = 'R' or 'r', LDA must be at least max(1, N); unchanged on exit.

В An array of dimension (LDB, N); on entry, the leading M by N part of the array B must contain the right-hand side matrix B, and on exit is overwritten by the solution matrix X.

LDB On entry, LDB specifies the first dimension of B as declared in the calling (sub) program. LDB must be at least max(1, M); unchanged on exit.

Appendix A. Base Operating System Error Codes for Services That Require Path-Name Resolution

The following errors apply to any service that requires path name resolution:

EACCES Search permission is denied on a component of the path prefix. **EFAULT**

The Path parameter points outside of the allocated address space

of the process.

EIO An I/O error occurred during the operation.

ELOOP Too many symbolic links were encountered in translating the Path

parameter.

ENAMETOOLONG A component of a path name exceeded 255 characters and the

> process has the **DisallowTruncation** attribute (see the **ulimit** subroutine) or an entire path name exceeded 1023 characters.

ENOENT A component of the path prefix does not exist.

ENOENT A symbolic link was named, but the file to which it refers does not

exist.

ENOENT The path name is null.

ENOTDIR A component of the path prefix is not a directory.

ESTALE The root or current directory of the process is located in a virtual

file system that is unmounted.

Appendix B. ODM Error Codes

When an ODM subroutine is unsuccessful, a value of -1 is returned and the **odmerrno** variable is set to one of the following values:

ODMI_BAD_CLASSNAME The specified object class name does not match the object class name in the

file. Check path name and permissions.

ODMI_BAD_CLXNNAME

The specified collection name does not match the collection name in the file.

The specified search criteria is incorrectly formed. Make sure the criteria

The specified search criteria is incorrectly formed. Make sure the criteria contains only valid descriptor names and the search values are correct. For information on qualifying criteria, see "Understanding ODM Object Searches"

in AIX 5L Version 5.3 General Programming Concepts: Writing and

Debugging Programs.

ODMI_BAD_LOCK
Cannot set a lock on the file. Check path name and permissions.

ODMI_BAD_TIMEOUT
The time-out value was not valid. It must be a positive integer.

ODMI_BAD_TOKEN

Cannot create or open the lock file. Check path name and permissions.

The specified object class does not exist. Check path name and permissions.

The specified object class already exists. An object class must not exist when

it is created.

ODMI_CLASS_PERMS The object class cannot be opened because of the file permissions.

ODMI_CLXNMAGICNO_ERR The specified collection is not a valid object class collection.

ODMI_FORK Cannot fork the child process. Make sure the child process is executable and

ry again.

ODMI_INTERNAL_ERR An internal consistency problem occurred. Make sure the object class is valid

or contact the person responsible for the system.

ODMI_INVALID_CLASS The specified file is not an object class.

ODMI_INVALID_CLXN Either the specified collection is not a valid object class collection or the

collection does not contain consistent data.

ODMI_INVALID_PATH The specified path does not exist on the file system. Make sure the path is

accessible.

ODMI_LINK_NOT_FOUNDThe object class that is accessed could not be opened. Make sure the linked

object class is accessible.

ODMI_LOCK_BLOCKED Cannot grant the lock. Another process already has the lock.

ODMI LOCK ENV Cannot retrieve or set the lock environment variable. Remove some

environment variables and try again.

ODMI_LOCK_ID The lock identifier does not refer to a valid lock. The lock identifier must be

the same as what was returned from the ${\it odm_lock}$ subroutine.

ODMI_MAGICNO_ERRThe class symbol does not identify a valid object class.

ODMI_MALLOC_ERR Cannot allocate sufficient storage. Try again later or contact the person

responsible for the system.

ODMI_NO_OBJECT The specified object identifier did not refer to a valid object.

ODMI_OPEN_ERR Cannot open the object class. Check path name and permissions.

ODMI_OPEN_PIPE Cannot open a pipe to a child process. Make sure the child process is

executable and try again.

ODMI_PARAMS The parameters passed to the subroutine were not correct. Make sure there

are the correct number of parameters and that they are valid.

ODMI_READ_ONLY

The specified object class is opened as read-only and cannot be modified.

Cannot read from the pipe of the child process. Make sure the child process

is executable and try again.

ODMI_TOOMANYCLASSES Too many object classes have been accessed. An application can only

access less than 1024 object classes.

permissions.

ODMI_UNLINKCLXN_ERR Cannot remove the object class collection from the file system. Check path

name and permissions.

ODMI_UNLOCKCannot unlock the lock file. Make sure the lock file exists.

Readers' Comments — We'd Like to Hear from You

AIX 5L Version 5.3

Technical Reference: Base Operating System and Extensions, Volume 2

Publication No. SC23-4914-06

We appreciate your comments about this publication. Please comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. The comments you send should pertain to only the information in this manual or product and the way in which the information is presented.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you state on this form.

Comments:

Thank you for your support.

Submit your comments using one of these channels:

- · Send your comments to the address on the reverse side of this form.
- Send your comments via e-mail to: pserinfo@us.ibm.com

If you would like a response from IBM, please fill in the following information:

	 -	
Name	Address	
Company or Organization		
Phone No	F-mail address
