About This Document

The *HP Integrity Virtual Machines Release Notes* document describes the latest enhancements and changes to the HP Integrity Virtual Machines product (Integrity VM), including limitations and guidelines for using the Integrity VM software. Always read the release notes before installing and using the product. For the most current information, obtain the latest version of this document from Integrity Virtual Machines documentation.

Intended Audience

This document is intended for system and network administrators responsible for installing, configuring, and managing Integrity VM. Administrators are expected to have an in-depth knowledge of HP-UX operating system concepts, commands, and configuration. In addition, administrators must be familiar with the HP Integrity machine console and how to install the operating systems and applications running on their virtual machines.

New and Changed Information in This Edition

This document supersedes the HP Integrity Virtual Machines Version 4.2.5 Release Notes, 5900–1277.

Typographic Conventions

find(1)	HP-UX manpage. In this example, "find" is the manpage name and "1" is the manpage section.
Book Title	Title of a book or other document.
Linked Title	Title that is a hyperlink to a book or other document.
http://www.hp.com	A website address that is a hyperlink to the site.
`Command`	Command name or qualified command phrase.
`user input`	Commands and other text that you type.
`computer output`	Text displayed by the computer.
Enter	The name of a keyboard key. Note that **Return** and **Enter** both refer to the same key. A sequence such as **Ctrl+A** indicates that you must hold down the key labeled **Ctrl** while pressing the **A** key.
term	Defined use of an important word or phrase.
`variable`	The name of an environment variable, for example `PATH` or `errno`.
`value`	A value that you might replace in a command or function, or information in a display that represents several possible values.
`<element>`	An element used in a markup language.
`attrib=`	An attribute used in a markup language.

Document Organization

This document contains information that supplements the information in the *Integrity Virtual Machines Version 4.3: Installation, Configuration, and Administration* and includes the following chapters:

- Chapter 1: "Introduction" (page 11) describes some of the enhancements and quality improvements in the current release of the HP Integrity Virtual Machines product.
- Chapter 2: "Installation Notes" (page 15) contains information about installing and upgrading Integrity VM and associated products.
- Chapter 3: "Creating Virtual Machines" (page 17) contains information about creating virtual machines.
- Chapter 4: "Installing Guests" (page 19) contains information about installing guest operating system and management software.
- Chapter 5: "Using Integrity VM Commands" (page 21) contains information about using Integrity VM commands.
- Chapter 6: "Guest Administration" (page 23) contains information about guest system administration.
- Chapter 7: "Networking Information" (page 25) contains information about virtual networking resources.
- Chapter 8: "Storage Information" (page 27) contains information about virtual data storage for guests.
- Chapter 9: "Migrating Virtual Machines" (page 29) contains information about migrating virtual machines from one system to another.
- Chapter 10: "Error Logging" (page 31) contains information about the message logging provided by Integrity VM.
- Chapter 11: "Integrity VM Support Policy" (page 33) contains tables listing the Integrity VM support on VM Hosts and guests.

Related Information

HP Insight Remote Support

HP strongly recommends that you install HP Insight Remote Support software to complete the installation or upgrade of your product and to enable enhanced delivery of your HP Warranty,

HP Care Pack Service or HP contractual support agreement. HP Insight Remote Support supplements your monitoring, 24x7 to ensure maximum system availability by providing intelligent event diagnosis, and automatic, secure submission of hardware event notifications to HP, which will initiate a fast and accurate resolution, based on your product's service level. Notifications may be sent to your authorized HP Channel Partner for on-site service, if configured and available in your country. The software is available in two variants:

- HP Insight Remote Support Standard: This software supports server and storage devices and is optimized for environments with 1-50 servers. Ideal for customers who can benefit from proactive notification, but do not need proactive service delivery and integration with a management platform.
- HP Insight Remote Support Advanced: This software provides comprehensive remote monitoring and proactive service support for nearly all HP servers, storage, network, and SAN environments, plus selected non-HP servers that have a support obligation with HP. It is integrated with HP Systems Insight Manager. A dedicated server is recommended to host both HP Systems Insight Manager and HP Insight Remote Support Advanced.

Details for both versions are available at:

http://www.hp.com/go/insightremotesupport

To download the software, go to Software Depot:

http://www.software.hp.com

Select Insight Remote Support from the menu on the right.

NOTE: HP recommends using Insight Remote Support on the VM Host system. Information from Insight Remote Support running on virtual machines should not be used to determine the hardware state.

HP Encourages Your Comments

HP encourages your comments concerning this document. We are truly committed to providing documentation that meets your needs.

Please submit comments to:

http://www.hp.com/bizsupport/feedback/ww/webfeedback.html

Please include the document title, manufacturing part number, and any comment, error found, or suggestion for improvement you have concerning this document.

1 Introduction

Thank you for installing HP Integrity Virtual Machines (also called Integrity VM). This *Release Notes* document describes the changes in this version of the Integrity VM product.

The Integrity VM Version 4.3 release introduces several new features including support for the HP-UX 11i v3 1103 as a VM Host. These release notes are solely for Integrity VM V4.3 issues. Check the online version of this manual on the BSC website, HP integrity Virtual Machines Documentation, for any issues that apply to V4.2.5 or earlier and for any required patches.

NOTE: Integrity VM patches for fixes developed subsequent to the Integrity VM V4.3 release are available at the HP IT Resource Center (ITRC) website: http://www.itrc.hp.com.

HP recommends that you install the latest AVIO components for both the VM Host and the guest; however, updating both guest and host components at the same time is not mandatory. Updating both components ensures that you always receive the latest bug fixes for a complete solution. HP fully supports different versions of the guest and VM Host AVIO components. For example, you can run a guest AVIO driver based on the March 2008 Fusion with a VM Host AVIO driver based on the December 2008 Fusion.

Always check the software depot website, http://software.hp.com, for the latest version of AVIO software. Search for the keyword HPVM AVIO. In addition, check this website to determine the required version of Ignite for AVIO.

This manual is organized in the following way:

- This introductory chapter contains a list of the new features provided in the new release, as well as a description of the manual organization. It also may contain information of general interest to the release, like Section 1.4 (page 13) and documentation issues.
- Chapter 2 through 10 provide release notes, relevant only to the V4.3 release.
- Chapter 11 provides the support policy tables for Integrity VM V4.3 and its components.

For the most up-to-date information about HP Integrity Virtual Machines, see the documentation on the Business Support Center website:

HP Integrity Virtual Machines documentation

For the most recent information relevant to this update, see the `README.txt` file at the following location:

`/opt/hpvm/doc/readme.txt`

1.1 New Features and Enhancements in This Version of Integrity VM

This section describes how the current version of Integrity VM has been enhanced over previous versions.

The features in the following list have been included in this release of Integrity VM:

- Support for the latest Intel® Itanium® Processor 9300 series on the following VM Host and guests:
  - HP-UX 11i v3 VM Host — HP-UX 11i v3 1103
  - HP-UX 11i v3 guests — HP-UX 11i v3 1003 through 1103 (all Integrity servers)
  - HP-UX 11i v2 guests — HP-UX 11i v2 0712 to 0806 (all Integrity servers)
- NVRAM Edit Utility — Displays, creates, edits and removes EFI variables in NVRAM files from a VM Host.
- HP Integrity VM virtual iLO Remote Console for HP–UX guests — Allows access to the guest console by logging into a specific IP address.

NOTE: To use telnet with the virtual iLO Remote Console feature, install the following patches on the VM Host:

— PHCO_41595

— PHNE_41452

- Serviceguard 11.20
- 16 virtual CPUs
- 128 GB guest memory
- 256 virtual AVIO storage devices
- Multiple Accelerated Virtual Input/Output (AVIO) LAN localnet support — For information, see Section 7.1.1 (page 25).
- Guest VLAN support for AVIO localnet — For information, see Section 7.1.1 (page 25).
- Support for NFS guest back stores for root, swap, and dump. For information, see Section 6.2.2.4 in the *HP Integrity Virtual Machines 4.3: Installation, Configuration, Administration*
- `hpvmsar` enhancements — For information about the new options, see Section 5.1.1 (page 21).
- Support for Fibre Channel over Ethernet (FCoE) using the next generation converged infrastructure (CNA) hardware.

NOTE: Integrity VM V4.3 supports HP NC551m Dual Port FlexFabric 10Gb Converged Network Adapter for FCoE and networking. For information about CNA, see *HP Converged Network Adapters (CNA)* at the following BSC website: HP Adapter and I/O Card documentation

- Hyperthreading no longer needs to be turned off in the Integrity VM Host before installing or using Integrity VM. It is no longer necessary to specify:

  ```
  /usr/sbin/setboot -m off
  ```

- Support for the following VM Host and guests — see Section 1.2 (page 13).

  For more information about support, see the support tables in Chapter 11 (page 33).

- Support for networking HBA's AM225A, AM232A, and AM233A

The features in the following list have been rolled-into Integrity VM V4.3 from the patch kits that were provided after Integrity V4.2 was released.

- OpenVMS V8.4 guest support
- HP Integrity server blades support
- Suspend and Resume support on HP-UX and OpenVMS guests, which allows you to suspend and resume a virtual machine. See the *hpvmsuspend (1M)* and *hpvmresume (1M)* manpages for details.
- Vswitch can be backed by a VLAN interface (IEEE 802.1Q).
- Support for HP Integrity Superdome 2
- `hpvmhostgdev` script utility
- Integrity VM is now fully supported with HP Insight Dynamics - VSE (ID−VSE) 6.2. Logical Server Management (LSM) and HP Insight Orchestration include support for Integrity VM Virtualization Provider Version 2.0 (VirtProvider), which is used with logical server features in Insight Dynamics to manage Integrity VM Hosts and HP-UX guests. For information about the new support in ID-VSE, see the *HP Integrity Virtual Machines 4.3: Installation, Configuration, and Administration* manual. For information about LSM, see *HP Insight Virtualization Manager Software with Logical Server Management: User Guide* at:

  www.hp.com/go/insightdynamics/docs.

  For information about Insight Orchestration, see the *HP Insight Orchestration 6.2 User Guide* at:

www.hp.com/go/insightdynamics/docs.

1.2 Guest and VM Host Support

The following table lists support in Integrity VM V4.3 for the various HP Integrity servers and HP Integrity server blades:

Table 1-1 Guest and VM Host Support

Guests	VM Host on HP Integrity server blades[1]	VM Host on HP Integrity Superdome 2[1]	VM Host on HP Integrity rx2800 i2 Servers[1]	VM Host on HP Integrity Servers
HP-UX 11i v3 1003	Yes	No	No	Yes
HP-UX 11i v3 1009	Yes	Yes	Yes	Yes
HP OpenVMS V8.4	Yes	No	No	Yes
HP-UX 11i v3 1103	Yes	Yes	Yes	Yes

1 Support for the latest Intel® Itanium® Processor 9300 Series

1.3 Changes in Support

The following list contains changes in support in future releases of Integrity VM:

- Use of VIO is deprecated starting in V4.3.

  VIO support is deprecated starting in the V4.3 release of of Integrity VM, so you should begin planning to convert from VIO to AVIO at your earliest opportunity. In addition, no new I/O hardware, such as FCoE CNA's will be supported with VIO. To determine if your VMs are using VIO, run `hpvmstatus -d` for all your guests. Look for storage devices that use `scsi` and look for network devices that use `lan`:

  ```
  # hpvmstatus -P guestname  -d | grep -w scsi
  # hpvmstatus -P guestname  -d | grep -w lan
  ```

- Integrity VM V4.3 does not support Microsoft Windows and Linux guests. Version 4.2.5 was the last version to support Microsoft Windows and Linux guests. For information about V4.2.5 support, see the HP Integrity Virtual Machines 4.2.5: Release Notes on the BSC website at:

  HP Integrity Virtual Machines and Online VM Migration

- Use of legacy device special files (DSFs) to define virtual storage is deprecated starting in V4.3.

  Support for the use of legacy DSFs to define virtual storage (including virtual disks and DVDs) are deprecated. Customers should begin planning to use persistent (agile) DSFs when defining their virtual storage devices. HP recommends the use of persistent DSFs (for example, those with pathnames such as `/dev/rdisk/disk##`) for better storage availability and reliability.

  To check for the use of legacy DSFs, use the following command:

  ```
  # hpvmstatus -P guestname -d | grep -w rdsk
  ```

1.4 Guest Management Software

Integrity VM provides specific software for each type of guest operating system. This guest management software enhances guest performance, enables Integrity VM commands, and includes providers for virtual management software, such as Integrity Virtual Machines Manager. The locations and contents of the guest management kits are modified in this version of Integrity VM. The guest management software is required on each guest.

Guest management software is installed on the guest either remotely, from a software depot, or locally, after being copied to the guest. The guest management software is located in the `/opt/hpvm/guest-images` directory. Table 1-2 lists the location of the guest management software kit for each type of guest operating system. The instructions for installing the guest management software are provided in `README.txt` files in these directories.

Table 1-2 Guest Management Software Kit Locations

Guest Operating System	Guest Management Software Location
HP-UX 11i v2	`/opt/hpvm/guest-images/hpux/11iv2`
HP-UX 11i v3	`/opt/hpvm/guest-images/hpux/11iv3`

NOTE: The HP OpenVMS guest kit is included in the HP OpenVMS Version 8.4 distribution media as part of the WBEM Provider kit.

Installing the guest management software kit causes the guest to reboot.

Whenever you upgrade Integrity VM, reinstall the guest kit on all the guests. This ensures that guests run well and continue to be manageable and supportable. Failure to install and upgrade the guest management software on each guest can cause problems that are difficult to diagnose and solve.

2 Installation Notes

This chapter contains notes about installing and upgrading Integrity VM and associated software on the VM Host system.

2.1 Installing Integrity VM

This section describes information about installing the HP Integrity Virtual Machines product and associated software on the VM Host system.

HP Integrity Virtual Machines B.04.30 is supported on HP Integrity servers or nPartitions running HP-UX 11i v3 March 2011 1103). When you upgrade or reinstall Integrity VM, guests are stopped, but they are not removed. When the new version of Integrity VM starts, the virtual machines might also start, depending on the setting of the guest boot attribute.

NOTE: Version 4.3 of Integrity Virtual Machines requires the installation of both the HostAVIOStor and HostAvioLan bundles.

The VM Host system is not a general-purpose system; it is dedicated to the hosting of virtual machines. After you install Integrity VM, no operating system or process management reconfiguration should be performed outside those provided by the Integrity VM interfaces. Specific examples of actions that are not supported on the VM Host system include:

- Changing priorities or scheduling attributes of processes on the VM Host system.
- Modifying kernel tunables in any way.

Do not install the VM Host software on a VM guest, and do not install the HPVM-Guest software on the VM Host. Neither configuration is supported.

For complete information about the requirements for installing Integrity VM, see the *HP Integrity Virtual Machines 4.3: Installation, Configuration, and Administration* manual.

2.2 Changes and Issues in This Release

The following section describes issues in this release.

2.2.1 Compatibility of Insight Dynamics - VSE V6.0 with Integrity VM V4.3

You can use V6.0 of Insight Dynamics - VSE V6.0 with Integrity VM V4.3, but this version of Insight Dynamics - VSE does not support the new features of Integrity VM V4.3.

2.3 HP-UX Patches Required in the VM Host

The only patches required in the VM Host are the patches needed to support the virtual iLO Remote Console feature on telnet. These are:

- PHCO_41595
- PHNE-41452

To view patches required prior to V4.3, see the *HP Integrity Virtual Machines Release Notes* manuals for the specific version in which you are interested at the BSC website:

HP Integrity Virtual Machines and Online VM Migration

2.4 Patches Required in the HP-UX Guest

There are currently no patches required in the HP-UX guest for V4.3. To view patches required prior to V4.3, see the *HP Integrity Virtual Machines Release Notes* manuals at the BSC website:

HP Integrity Virtual Machines and Online VM Migration

For more information about updates to HP-UX software, contact your HP representative or support specialist.

2.5 Patches Required in the HP OpenVMS Guest

Integrity VM V4.3 supports HP OpenVMS V8.4 guests with the following update installed:

HP I64VMS VMS84I_UPDATE V4.0

3 Creating Virtual Machines

This chapter contains notes about creating and configuring virtual machines on the VM Host system.

3.1 Changes and Issues in this Release

This section describes virtual machine creation or configuration issues in this release.

3.1.1 Pass-Through Devices Used by Guest Devices Might Not be Valid After Recovery Using Ignite

After performing a recovery of the host using Ignite, pass-through devices found in `/dev/pt/*` might be invalid, which in turn might prevent guests from recognizing tape or disk devices. Symptoms of this problem might include error messages like the following in the guest log file (`/var/opt/hpvm/guests/`*`vm-name`*`/log`):

```
UsrMapScsiDevice: Opened failed on /dev/pt/pt_tape1: No such device or address
```

You might receive messages like the following in the `/var/opt/hpvm/common/command.log` file:

```
mksf: Couldn't find driver matching arguments
  hpvmdevmgmt: ERROR (host): system() failed on command '/usr/sbin/mksf -P -C disk -I 44 2>&1 >/dev/null' - No
 such file or directory.
```

These messages can be caused by pass-through files being stale and in need of re-creation, pass-through files pointing to devices that no longer correspond to devices that their names suggest, or device special file names (DSFs) for devices that no longer exist for which `hpvmdevmgmt -I` attempts to create pass-through devices.

To correct `/dev/pt/*` files that might be stale or which might point to the wrong device, do the following on the VM Host to re-create them:

```
# rm /dev/pt/*
# rm /var/opt/hpvm/common/hpvm_devinit
# hpvmdevmgmt -I
```

To correct failed attempts by `hpvmdevmgmt -I` to create pass-through devices for devices that no longer exist, use `lssf` to verify the validity of devices that no longer appear to exist:

```
# lssf -s
```

Verify that your guests are not configured to use those DSFs, and then remove them using `rmsf`:

```
# rmsf -x
```

3.1.2 Do Not Run `hpvmstart` in Background When Starting Multiple Guests With Resource Conflicts

Do not run the `hpvmstart` command in the background when starting multiple guests that have resource conflicts. The locking that would normally catch and report the resource conflicts does not always work properly in this situation.

4 Installing Guests

This chapter describes notes pertaining to installing guest software on the virtual machines.

4.1 HP-UX Guests

The following sections contain release notes specific to installing HP-UX guests in the V4.3 release.

4.1.1 Do Not Use the `iomap(7)` Mechanism on HP-UX Guests

The `iomap(7)` mechanism allows you to map physical I/O addresses into the user process address space. Do not use this command on HP-UX guests.

4.2 OpenVMS Guests

There are currently no release notes specific to installing OpenVMS guests in the V4.3 release.

5 Using Integrity VM Commands

This chapter contains notes about the Integrity VM commands.

5.1 Changes and Issues in This Release

The following sections describe changes, issues, and new information pertaining to this release.

5.1.1 Integrity VM Command Changes

The Integrity VM commands have changed in the following ways:

- The following new commands have been added:
  - `hpvmnvram` command

    Displays, creates, edits and removes EFI variables in NVRAM files from a VM Host.

  - `hpvmhostgdev` command

    Manages Integrity VM Host devices available for virtual machine access.

- The `hpvmclone`, `hpvmcreate`, and `hpvmmodify` commands have the following new options:
  - `-K` *`console_IP_Addr`*

    Specifies the IP address used to connect to the guest's remote console. The address must be specified in IPv4 dot notation or 0. If 0 is entered, then the guest will no longer have remote console access using IP.

  - `-L` *`console_IP_Addr_Netmask`*

    Specifies the IPv4 subnet mask used with the option when setting up the IP interface to be used for accessing the remote console for this guest. The address is entered in dot notation form.

- The `hpvmsar` command has several new options:
  - `-F`

    Displays Integrity VM core Memory Metrics activity by Guest Display for the sample interval. The `-M` option displays all counts by vCpu.

  - `-G`

    Displays the Guest Dynamic Memory, Swapping, and Paging Activity for the sample interval.

  - `-H`

    Reports the Memory usage for various Integrity VM components, including dynamic memory.

  - `-I`

    Reports Guest Interrupt Activity. The `-M` option displays all counts by vCpu.

  - `-N`

    Displays Guest Network traffic by vswitch Activity Display.

  - `-S`

    Displays Vswitch Network traffic Activity by Port Display.

5.1.2 Changing Guest LAN from AVIO to VIO

When changing a guest LAN from AVIO to VIO, you must restart the vswitch that the LAN is on. Use the following commands:

```
hpvmnet -r -S switchname // for the vswitch associated with the LAN change
```

5.1.3 The `hpvmdevmgmt` Command Truncates File Sizes

When you use the `-S` option on the `hpvmdevmgmt` command to create a file to be used as a virtual device, you can specify the file size. The file size must be specified in whole integers. Anything after the initial whole integer is ignored. For instance, both the `hpvmdevmgmt -S 1G` command and the `hpvmdevmgmt -S 1.5G` command create a 1 GB file.

6 Guest Administration

This chapter contains information about managing Integrity VM guests.

6.1 Changes and Issues in this Release

There are no new guest administration issues in the V4.3 release.

6.1.1 Using HP Serviceguard to Manage Guests

This section lists release notes specific to using Serviceguard in the Integrity VM environment.

Do not attempt to use guests as Serviceguard packages and guests as Serviceguard nodes at the same time on the same VM Host system.

You can install HP Serviceguard A.11.19 or A.11.20 on the VM Host or on the HP-UX guest. You can install HP Serviceguard A.11.19 or A.11.20 on guests running HP-UX 11i v3.

7 Networking Information

This chapter contains notes about configuring networks for virtual machines.

7.1 Changes and Issues in This Release

The following sections contain networking information for the V4.3 release.

7.1.1 New Features Added to Integrity VM AVIO Networking

The following two new features have been added to Integrity VM AVIO networking:

- Multiple localnet support

  By using this feature, you can create multiple instances of localnet vswitches. AVIO guests configured on each localnet vswitches can communicate only among themselves. Additionally, guests configured on the localnet vswitches cannot communicate with the VM Host or the external world.

- Guest VLAN support for AVIO localnet

  Integrity VM V4.3 introduces support for Guest VLAN tagging for local networks. Prior to V4.3, this feature was supported only for guests that were configured on vswitches backed by physical PPA. Starting with Integrity VM V4.3, the same Guest VLAN tagging support is also supported on localnet vswitches.

For information about managing AVIO local networks, see the *HP Integrity Virtual Machines 4.3: Installation, Configuration, Administration* manual.

7.1.2 IP Aliases Configured on the LAN Bound to a vswitch

If IP aliases were configured on the LAN bound to a vswitch, `hpvmnet` did not display the correct primary IP address of the LAN. This problem has been corrected.

7.1.3 AVIO LAN Devices Left Unclaimed by OpenVMS Guest if vswitch is Down at Boot

If you boot an OpenVMS guest while the vswitch is not UP, AVIO interfaces associated with the vswitch might not be claimed in the guest. For example, this issue might occur if the guest is booted prior to booting the vswitch, or if the corresponding network interface on the VM Host is not cabled during the guest boot time.

If you encounter this problem, perform the following steps:

1. Fix the vswitch state; that is, ensure that the hpvmnet command displays the vswitch state as UP.
2. Once the vswitch is started, reboot the OpenVMS guest to get the AVIO LAN devices recognized, which ensures that all the AVIO LAN interfaces that are configured through this vswitch are recognized by the guest.

7.1.4 Using IP Alias Addresses in the Guest Not Supported for IPv4 or IPv6

Integrity VM Version 4.1 does not support the use of IP alias addressing in the guest for either IPv4 or IPv6.

7.1.5 Do Not Use TCP Software Packet Reassembly in IGSSN Driver

For AVIO, there have been problems with TCP Software Packet reassembly in the igssn driver in a guest HP-UX image. For this release, do not enable it on a guest. By default, software packet reassembly (known with acronyms as drv_pr for driver packet reassembly) is enabled in igssn in the guest.

To determine if drv_pr is enabled, an administrator can execute the following command:

```
lanadmin -x drv_pr ppa
```

where *ppa* is the Card instance # (Crd in#) from `lanscan`.

To manually disable drv_pr, an administrator can execute the following command:

```
lanadmin -X drv_pr_off ppa
```

To manually enable `drv_pr`, an administrator can execute the following command:

```
lanadmin -X drv_pr_on ppa
```

NOTE: These change are not carried over to subsequent reboots of the system. To maintain the configuration over reboots of the guest, the administrator must edit the guest file, `/etc/rc.config.d/hpigssnconf`.

For each igssn device that must have `drv_pr` disabled, you must construct a block of information in the `hpigssnconf` file. For example, if your guest needed to have both lan0 and lan3 disable `drv_pr`, you might have:

```
HP_IGSSN_INTERFACE_NAME[0]=lan0
HP_IGSSN_STATION_ADDRESS[0]=
HP_IGSSN_MTU[0]=
HP_IGSSN_DRV_PR[0]=0

HP_IGSSN_INTERFACE_NAME[3]=lan3
HP_IGSSN_STATION_ADDRESS[3]=
HP_IGSSN_MTU[3]=
HP_IGSSN_DRV_PR[3]=0
```

8 Storage Information

This chapter contains information about storage devices used as backing stores for guest virtual devices.

8.1 Changes and Issues in This Release

The following sections provide storage issues in the V4.3 release.

8.1.1 Storage Interface Support for OpenVMS Guests

The OpenVMS guest supports the AVIO interface, however, Integrity VM commands allow you to configure both AVIO and VIO devices to a guest. These VIO devices might not give any apparent errors during the startup. VIO devices and attached AVIO devices are not supported on OpenVMS guests.

8.1.2 Host AVIO and Guest AVIO Versions

The following table shows the Host AVIO and Guest AVIO storage versions:

Table 8-1 Host AVIO and Guest AVIO Versions

AVIO Product	Version	Operating System	Other Software
HostAVIOStor	B.11.31.1103	HP-UX 11i v3	• PHKL_38604, PHKL_38605, and PHKL_38750 • PHSS_40152 and Serviceguard for support of migration of shared LVMs
GuestAVIOStor	B.11.23.0903	HP-UX 11i v2	None
GuestAVIOStor	B.11.31.1009	HP-UX 11i v3	PHKL_38604 and PHKL_38750

8.1.3 Agile DSFs Change in HP-UX 11i v3 Guest When Migrating Disks Between `scsi` and `avio_stor`

GuestAVIOStor version B.11.31.0810 or higher version fixes the change of agile device names in the guest OS when HBA is migrated between scsi (VIO) and AVIO storage. Follow these steps while changing the configuration of a guest HBA between VIO and AVIO. This is to ensure that agile disk device files under the modified HBA remain the same. If individual devices are moved between AVIO and VIO using `hpvmmodify` delete and add, the agile device name will change. The old device name can be restored using `scsimgr` or the affected applications modified to use the new device name. Perform the following steps:

- Boot the guest with the GuestAVIOStor 11.31.0810 depot. (This step is required even if you do not have any AVIO devices configured.)
- Shut down the guest gracefully using the `shutdown(1m)` command.
- Migrate the HBA from VIO to AVIO (or AVIO to VIO) using the `hpvmmodify` command.
- Boot the guest and verify that all the agile device files are as expected.

The following messages might appear on the guest console during the first boot after a `scsi hba` has been changed to `avio_stor hba`. The LVM error messages are harmless. Use the `lvlnboot -R` command to fix the boot information on the root logical volume and eliminate these boot-time messages:

```
LVM: Failure in attaching PV (dev=0x3000006) to the root volume group.
```

The physical volume does not exist, or is not configured in the kernel.

```
LVM: Activation of root volume group failed
```

Quorum not present, or some physical volume(s) are missing.

```
LVM: Scanning for Root VG PVs (VGID 0xef4fbb14 0x48acd569)
LVM: Rootvgscan detected 1 PV(s).  Will attempt root VG activation using
        the following PV(s):
        0x3000003

LVM: Root VG activated
    Swap device table:  (start & size given in 512-byte blocks)
        entry 0 - major is 64, minor is 0x2; start = 0, size = 4194304 Checking root file system.
file system is clean - log replay is not required Root check done.
Create STCP device files
:
:
GuestAVIOStor: Instance numbers for AVIO/VIO disks fixed due to HBA type changes.
GuestAVIOStor: Refer to /etc/opt/gvsd/files//gvsd.log for details.
```

8.1.4 Configuration Limits

A guest can have up to 286 LUN — 256 AVIO and 30 VIO. A guest can have a maximum of 30 file backing stores, including both AVIO and VIO.

8.1.5 AVIO Limitations

The following sections describe the current limitations using AVIO. For a complete list of AVIO limitations, see the *HP Integrity Virtual Machines 4.3: Installation, Configuration, Administration* manual on the BSC website:

HP Integrity Virtual Machines and Online Migration

8.1.5.1 Presenting a Logical Volume Created on iSCSI Devices as AVIO Backing Store to a Guest Not Supported

Presenting a Logical Volume that is created on an iSCSI device as an AVIO backing store to a guest is not supported.

8.1.5.2 Online Modification of AVIO Devices Might Fail

Devices configured under AVIO Stor HBA for a guest cannot be deleted (using the `hpvmmodify` command) if the guest is at EFI.

Stop the guest using the `hpvmstop` command and retry the `hpvmmodify` command.

Devices configured under AVIO Stor HBA for an HP-UX 11i v3 guest cannot be deleted (using the `hpvmmodify` command) if the guest is online.

Run `ioscan -kfNC tgtpath` or `ioscan -kfNC lunpath` from the guest to obtain the `tgtpath` or `lunpath` H/W Path for the device to be deleted. Remove the device by using `rmsf -H` of the `lunpath` or `tgtpath` H/W Path from the guest and retry the `hpvmmodify` command from the host.

9 Migrating Virtual Machines

This chapter contains information about migrating virtual machines.

9.1 Changes and Issues in This Release

The following sections discuss issues that apply to online migration in the V4.3 release.

9.1.1 Guests Using IPv6 Not Supported for Online VM Migration

IPv6 networks are supported, so long as guests also have some IPv4 networking. Guests using IPv6 are not currently supported for Online VM Migration.

IPv6-only AVIO interfaces are supported for Online VM Migration.

9.1.2 Guests Using Attached AVIO Devices Not Supported for Online VM Migration

Guest using attached AVIO devices are not currently supported for Online VM Migration.

10 Error Logging

This chapter contains information about the way Integrity VM logs messages.

10.1 Changes and Issues in This Release

There are no new error logging issues in the V4.3 release.

10.2 Known Issues and Information

The following sections describe known issues and information from previous releases that still apply to V4.3.

10.2.1 Old Version of `/etc/rc.config.d/hpvmconf` Not Overwritten

When you install the new version of Integrity VM, a new version of the `/etc/rc.config.d/hpvmconf` file is placed on the system. You receive the following messages:

```
A new version of /etc/rc.config.d/hpvmconf has been placed on the system. The new version is located at /opt/
hpvm/newconfig/etc/rc.config.d/hpvmconf. The existing version of /etc/rc.config.d/hpvmconf is not being
overwritten, since it appears that it has been modified by the administrator since it was delivered.
```

You might receive the following message:

```
The postinstall script for HPVM.HPVM-CORE had a warning (exit code 103). The script location was /var/tmp/
BAA008384/catalog/HPVM.1/HPVM-CORE/postinstall. This script has warnings, but the execution of this fileset
will still proceed. Check the above output from the script for
further details.
```

10.2.2 Guest Log Can Grow Unbounded

The guest monitor log file (`/var/opt/hpvm/guests/`*`vm_name`*`/log`) records guest start and stop information. These log files can grow very large. Use the `hpvmconsole` command `rec -rotate` to close the current log file, rename it, and open a new one.

10.2.3 Log Messages Written to Old Log File

Log messages might be written to the `command.log.old` file instead of the `command.log` file. If this is a problem, reboot the VM Host system. This reinitializes the log file for applications that generate Integrity VM log messages to write to the current `command.log` file.

10.2.4 Saved MCA or INIT Register State Can Be Inaccurate

Virtual machines do not support standard management processor console `errdump` commands. The virtual console's Virtual Machine menu provides the `ed` command for this purpose. The options for a virtual machine are `-mca` and `-init`. When you examine the saved guest state using the `ed -mca` or `ed -init` command, the preserved branch registers (B1-B5) do not always contain accurate data.

10.2.5 Modifying the Size of the Monitor Log File

Integrity VM includes a monitor log (`/var/opt/hpvm/common/hpvm_mon_log`), which captures the state of the VM Host. The size of the log file is determined by the VMMLOGSIZE tunable, stored in the `/etc/rc.config.d/hpvmconf` file.

When the log file reaches VMMLOGSIZE, the current timestamp is appended to the name of the log file and a new log file is opened. If you see many such files, increase the value of the VMMLOGSIZE tunable. Do not set the value of the VMMLOGSIZE tunable below its 1024 KB default.

10.2.6 Virtual Console Event Logs Different from Physical Machine Logs

The virtual console allows you to use the `sl` command to list the System Event log and the Forward Progress log. The displays from the virtual console differ from those generated on a physical machine in the following ways:

- Event numbering is inconsistent for different lines.
- Although the command menu allows you to specify a cell number, virtual machines are not cellular. Therefore, this option is not functional.

11 Integrity VM Support Policy

This chapter describes the HP Integrity Virtual Machine support policies and software version requirements for Integrity VM Host and guest operating system environments.

11.1 Integrity VM Minimum Support Life

The following table shows the support dates for Integrity VM versions.

Integrity VM Version	Release Date	Expected End of Support Date	Current Status
A.03.50	December 2007	Same as HP-UX 11i v2	Supported
B.04.00	September 2008	September 2011	Supported
B.04.10	April 2009	April 2012	Supported
B.04.20	March 2010	March 2013	Supported
B.04.20.05	September 2010	September 2013	Supported
B.04.30	March 2011	December 2013	Supported

NOTE: Integrity VM is supported for the HP-UX 11i v2 VM Host until the end of support of HP-UX 11i v2.

11.2 Integrity VM Upgrades

- Recommendation:

  Upgrade to the current version of Integrity VM software and, for each virtual machine, upgrade the Guest Management software.

- Requirement:

  Customers must upgrade to the latest release in order to receive defect fixes.

11.2.1 Changes in Support

The following list contains changes in support in future releases of Integrity VM:

- VIO support is deprecated in a future release.

  VIO support will be dropped in a future release of Integrity VM, so you should begin planning to convert from VIO to AVIO at your earliest opportunity. To determine if your VMs are using VIO, run `hpvmstatus -d` for all your guests. Look for storage devices that use `scsi` and look for network devices that use `lan`:

  ```
  # hpvmstatus -P guestname  | grep -w scsi
  # hpvmstatus -P guestname  | grep -w lan
  ```

- Integrity VM V4.3 does not support Microsoft Windows and Linux guests. Version 4.2.5 was the last version to support Microsoft Windows and Linux guests. For information about V4.2.5 support, see the HP Integrity Virtual Machines 4.2.5: Release Notes on the BSC website at:

  HP Integrity Virtual Machines and Online VM Migration

- Use of legacy device special files (DSFs) to define virtual storage is deprecated starting in Version 4.3.

  Support for the use of legacy DSFs to define virtual storage (including virtual disks and DVDs) are deprecated. Customers should begin planning to use persistent (agile) DSFs when

defining their virtual storage devices. HP recommends the use of persistent DSFs (for example, those with pathnames such as `/dev/rdisk/disk##`) for better storage availability and reliability.

To check for the use of legacy DSFs, use the following command:

```
# hpvmstatus -P guestname -d | grep -w rdsk
```

11.3 VM Host OS and Server Support

Integrity VM Host or Server Support	Integrity VM Version A.03.50	Integrity VM Version B.04.00	Integrity VM Version B.04.10	Integrity VM Version B.04.20	Integrity VM Version B.04.20.05	Integrity VM Version B.04.30	Notes
VM Host OS Support	HP-UX 11i v2 December 2007	HP-UX 11i v3 September 2008	HP-UX 11i v3 March through September 2009	HP-UX 11i v3 March 2010	HP-UX 11i v3 September 2010	HP-UX 11i v3 March 2011	New Integrity VM versions support the latest HP-UX OE release at the time of the Integrity VM release. For more information about support for specific HP-UX versions, see an authorized HP representative.
VM Host Server Support	Integrity VM supports all Integrity servers. New servers are supported on the latest Integrity VM version concurrent with the shipment of that server.						

For information about installing Integrity VM, see the *HP Integrity Virtual Machines 4.3: Installation, Configuration, and Administration* manual.

11.4 HP-UX Guest Support

Type of Guest OS Support	Integrity VM Version A.03.50	Integrity VM Version B.04.00	Integrity VM Version B.04.10	Integrity VM B.04.20	Integrity VM B.04.20.05	Integrity VM B.04.30	Notes

1 Support for the latest Intel® Itanium® Processor 9300 series

2 Requires V4.2 with the following VM Host patches:

PHSS_40875 1.0 HPVM B.04.20 CORE PATCH
PHSS_40876 1.0 HPVM B.04.20 VMAGENT
PHSS_40901 1.0 HPVM B.04.20 VMMIGRATE PATCH

NOTE: For information about required patches, see Chapter 2 (page 15).

HP-UX patches might be required for proper operation. Install these patches on HP-UX guest operating systems as necessary. For specific patch information, see the patches listed in Chapter 2 (page 15) .

11.5 Windows and Linux Guest Support

Type of Guest OS	Integrity VM Version A.03.50	Integrity VM Version B.04.00	Integrity VM Version B.04.10	Integrity VM Version B.04.20	Integrity VM Version B.04.20.05	Notes

1 Intel® Itanium® 2 9000 Series and Intel Itanium 2 9100 Series

2 Requires V4.2 with the following VM Host patches:

PHSS_40875 1.0 HPVM B.04.20 CORE PATCH
PHSS_40876 1.0 HPVM B.04.20 VMAGENT
PHSS_40901 1.0 HPVM B.04.20 VMMIGRATE PATCH

3 Support for the latest Intel® Itanium® Processor 9300 Series

11.7 HP Serviceguard Support

The version of Serviceguard must be supported with the version of HP-UX on which the VM Host is running. Integrity VM V4.3 supports Serviceguard 11.20. For specific support information, see the Serviceguard documentation.

Packages or Nodes	Integrity VM Version A.03.50	Integrity VM Version B.04.00	Integrity VM Version B.04.10	Integrity VM Version B.04.20	Integrity VM Version B.04.20.05	Integrity VM B.04.30	Notes
Serviceguard – Virtual machines as packages (Serviceguard running on VM Host)	Serviceguard release • A.11.16 • A.11.17 • A.11.17 w/ SMS A.01.00 • A.11.18 • A.11.18 w/ SMS A.01.01 • A.11.18 w/ SMS A.02.00	Serviceguard release • A.11.18 • A.11.18 w/ SMS A.02.00	Serviceguard release • A.11.18 (not supported with Online VM Migration) • A.11.19	Serviceguard release • A.11.19	Serviceguard release • A.11.19	Serviceguard release • A.11.20	New versions of Integrity VM support all guest OS types and versions supported by previous versions of Integrity VM (as long as the guest OS version is supported by the OS vendor). SMS is also known as CFS.

Serviceguard — Linux virtual machines as nodes (Serviceguard running on a guest)	Serviceguard release • A.11.18 Guest running Red Hat Linux Release 4 Updates 4 and 5 SUSE Linux SLES10 SP1	Serviceguard release • A.11.18 (RHEL 4 Update 5 • A.11.18 (SUSE SLES 10 SP1)	Serviceguard release • A.11.19 (RHEL 4 Update 5 • A.11.19 (SUSE SLES 10 SP2)	Serviceguard release • A.11.19	Serviceguard release • A.11.19 • A.11.20		

11.8 Storage Interface Support

Integrity VM Version A.03.50 (Both VIO and AVIO unless explicity excluded)	Integrity VM Version B.04.00 (both VIO and AVIO unless explicitly excluded)	Integrity VM Version B.04.10 (both VIO and AVIO unless explicitly excluded)	Integrity VM Version B.04.20, B.04.20.05, and B.04.30 (both VIO and AVIO unless explicitly excluded)	Notes
• Fibre Channel adapters supported by TD, FCD, or FLCP drivers • SCSI adapters supported by the C8*xx*, MPT, or CISS drivers • IDE adapters supported by the SIDE driver • USB support of the UsbScsiAdapter driver and USB 2.0 support of the usb_ms_scsi driver (AVIO HVSD support for USB 2.0 as of 11i v2 0810 web release) • iSCSI adapters supported by the iSCSI driver • SAS adapters supported by the SASD driver	• Fibre Channel adapters supported by TD, FCD, or FLCP drivers • SCSI adapters supported by the C8xx, MPT, or CISS drivers • IDE adapters supported by the SIDE driver • USB support of the UsbScsiAdapter driver • USB 2.0 support of the usb_ms_scsi driver on VIO • iSCSI adapters supported by the iSCSI driver (AVIO requires HostAVIOStor B.11.31.1009.01 or later) • SAS adapters supported by the SASD driver	• Fibre Channel adapters supported by TD, FCD, or FLCP drivers • SCSI adapters supported by the C8xx, MPT, or CISS drivers • IDE adapters supported by the SIDE driver • USB support of the UsbScsiAdapter driver and USB 2.0 support of the usb_ms_scsi driver (AVIO HVSD support for USB 2.0 as of 11i v3 0903) • iSCSI adapters supported by the iSCSI driver (AVIO requires HostAVIOStor B.11.31.1009.01 or later) • SAS adapters supported by the SASD driver	• Fibre Channel adapters supported by TD, FCD, or FLCP drivers • SCSI adapters supported by the C8xx, MPT, or CISS drivers • IDE adapters supported by the SIDE driver • USB support of the UsbScsiAdapter driver and USB 2.0 support of the usb_ms_scsi driver (AVIO HVSD support for USB 2.0 as of 11i v3 0903) • iSCSI adapters supported by the iSCSI driver (AVIO requires HostAVIOStor B.11.31.1009.01 or later) • SAS adapters supported by the SASD driver • For B.04.30 and AVIO only, FCoE support provided by CNA supported by the FCoC driver	Virtual I/O storage interfaces are those defined using the *scsi* adapter type. Accelerated virtual I/O (AVIO) storage interfaces are defined using the *avio_stor* adapter type. (See the `hpvmresources` manpage.)

11.8.1 Guest Attached Device Support

Integrity VM Version B.04.30	Notes
• CD/DVD burners • Media changers • Tape devices	Attached devices are supported for all types of guest operating systems that provide supported drivers for the physical device as attached to the VM Host device.

NOTE: Attached devices (VIO) and burners are not supported for OpenVMS guests.

11.8.2 Multipathing Software Support

Multipathing software is supported on the Integrity VM Host system. Unless specified otherwise, multipathing is supported for use with either legacy virtual I/O (virtual adapter type specified as *scsi*) or AVIO (virtual adapter type specified as *avio_stor*). The required version for these products is determined by the software vendor and the release of HP-UX installed on the VM Host system.

NOTE: Starting with HP-UX 11i v3 0909, LV Mirroring is supported on HP-UX 11i v3 guests with Integrity VM V4.0 or later using AVIO.

Backing Store	Integrity VM Version B.04.30
Whole Disk (or LUN)	• HP-UX 11i v3 built-in multipathing • • EMC PowerPath[1] with legacy DSFs
LVM Logical Volumes	• HP-UX 11i v3 built-in multipathing • PVLinks • EMC PowerPath[1] with legacy whole disk DSF in a Volume Group
VxVM Logical Volumes	• HP-UX 11i v3 built-in multipathing • EMC PowerPath[1] with legacy whole disk DSF in a Disk Group • Symantec DMP
VxFS Files	• HP-UX 11i v3 built-in multipathing • PVLinks • EMC PowerPath[1] with legacy disk DSF in a Volume Group • Symantec DMP

1 Supported by EMC. See EMC documentation.

11.8.3 EVA Series Firmware Requirement

The AVIO Storage Driver supports Active-Active firmware types on EVA series (3000/5000 and 4000/6000/8000). Be sure that the following firmware revision levels are met before configuring AVIO backing stores on these arrays:

- On EVA 4000/6000/8000, all released firmware revisions support Active-Active configuration. Therefore, no action is necessary on these arrays.
- EVA 3000/5000 arrays need minimum firmware revisions of VCS v4.004 (Active-Active firmware).

For more information about EVA firmware upgrades, see the HP Services website: HP Services.

11.9 Network Interface Support

VM Host I/O is HP-UX based. Specific network interfaces are supported if they are supported for the version of HP-UX in use on the VM Host system. The VM Host physical network interface card can be configured with Auto Port Aggregation (APA), with the resulting port supported as indicated in the following table:

Virtual Network Adapter Type	Integrity VM Version B.04.30
lan (legacy VIO)	All HP-UX supported Ethernet interfaces
avio_lan (AVIO)	The following Ethernet drivers are supported, including APA ports: • iether • igelan • ixgbe • icxgbe • iexgbe • Networking support provided by CNA, supported by the iocxgbe driver

11.10 AVIO Support

Integrity VM V4.3 supports AVIO storage drivers and AVIO networking drivers.

11.11 Online and Offline Migration Support

The following list provides the supported online and offline migration paths for HP-UX and OpenVMS guests:

- Online migration support:
  - Forward migration — Supported between two VM Hosts running the same or subsequent Integrity VM version (see Table 11-1 (page 41)).
  - Backward migration — Supported for a guest migrating back only to a VM Host running the same Integrity VM version on which the guest was originally booted (including any Integrity VM release patches that were installed on the original VM Host) and has not been rebooted since. As of Integrity VM Version 4.3, a guest can also be migrated back to a VM Host that is running a later version of Integrity VM on which the guest was originally booted. For example, a guest booted on a VM Host running Integrity VM Version 4.2, then migrated to a VM Host running Version 4.3, can be migrated back to a VM Host running version 4.2.5 (provided the guest has not been rebooted since beginning its migration).
  - Online forward migration table:

Table 11-1 Online Forward Migration Paths

Integrity VM Version	Supported Forward Migration Path
Integrity VM V4.1	Integrity VM V4.1 or Integrity VM V4.2
Integrity VM V 4.2	Integrity VM V4.2, Integrity VM V4.2.5, or Integrity VM4.3
Integrity VM V4.2.5	Integrity VM V4.2.5 or Integrity VM V4.3
Integrity VM V4.3	Integrity VM V.3

- Offline migration support:
  - Offline migration support table:

Table 11-2 Offline Forward and Backward Migration Support Paths

Integrity VM Version	Supported Offline Migration Path (Forward and Backward)
Integrity VM V3.5	Integrity VM V3.5
Integrity VM V4.0	Integrity VMV4.0
Integrity VM V4.1 or later	Integrity VM V4.1 or later

NOTE: When migrating across versions (Integrity VM 4.1 and later), be aware of the guest OS versions that are supported on the target host. If the guest is not supported by the target host, the guest must be updated immediately after migrating to maintain support on the target host.

Before booting B.11.31.1103 GuestAVIOStor on Integrity VM V4.2.5 (or earlier) and migrating this guest from the source host with Integrity VM V4.2.5 (or earlier) to a target host with Integrity VM V4.3, install the following patches for Integrity VM V4.2.5 (or earlier):

— PHSS_41785: 4.1 HPVM Core Patch: PK4
— PHSS_41786: 4.2 HPVM Core Patch: PK4
— PHSS_41787: 4.2.5 HPVM Core Patch: PK4

NOTE: For a list of V4.2.5 general release patches, see the VM Host and VM Guest patch tables in the *HP Integrity Virtual Machines 4.2.5: Release Notes* on the BSC website:

HP Integrity Virtual Machines and Online VM Migration

11.12 Supported Adapters

Integrity VM supports those adapters that are of Ethernet or the IEEE 802.3 CSMA/CD network. Note that AVIO interfaces are supported by a select set of Ethernet host NICs. The following Ethernet cards are supported with AVIO on HP-UX guests:

- A6794A — Core
- A6825A — Core
- A7109A — Core
- A6847A — Add-in
- AB465A — Combo Add-in
- A9782A — Combo Add-in
- A9784A — Combo Add-in
- AB352 — Core
- AB545A — Networking Add-in
- A7011A — Networking Add-in
- A7012A — Networking Add-in
- AB290A — Combo Add-in
- AB287A — Add-in (10GbE)
- AD331A — Add-in
- AD332A — Add-in
- AD193A — Combo Add-in
- AD194A — Combo Add-in
- AD221A — Add-in
- AD222A — Add-in
- AD337A — Add-in
- AD338A — Add-in
- AD339A — Add-in
- AD385A — Add-in (10GbE)
- AD386A — Add-in (10GbE)
- HBA's AM225A, AM232A, AM233A
- NC360m — C-class Mezz card

- NC364m — C-class Mezz card
- HP NC551m Dual Port FlexFabric 10Gb Converged Network Adapter
